INDEX

Illustrated articles indicated by *

A

- **Abbott, Charles F.:**
  - Does Price Cutting Help Buyer? Apr 12 p 1005
  - Merchandising, New Competition and, June 14 p 1679
  - Price Cutting Unethical, May 17 p 1429
  - Wasted Profits, Feb 23 p 531
- **Accidents:**
  - Avoided by Cupola Charging System*, Feb 16 p 461
  - Bethlehem Prizes for Prevention of, Jan 12 p 156
  - Detecting Proneness to (Editorial), May 3 p 1264
  - Economic Value of Safety Work, June 21 p 1745
  - Greater on Street Than in Factory, Apr 5 p 935
  - In Foundries (Editorial), Feb 16 p 484
  - In Metal Industries 1926, 1927, June 7 p 1595
  - In Small Plants, Feb 9 p 418
  - Industrial, Study in (Editorial), June 7 p 1625
  - Low Rate in Larger Plants (Editorial), Apr 19 p 1107
  - Oglebay, Norton Mining Record, May 31, p 1548
  - Safety in the Machine Shop, June 7 p 1610
  - Stanley & Patterson, Inc., Wins Contest Prize, Feb 16 p 460
  - Union Steel Casting Co. Record, Jan 19 p 204
- **Aetna-Standard Engineering Co.:**
  - Disk Rolling Machine*, Mar 8 p 659
  - Sheet Pack Opener*, Mar 15 p 736
- **Africa:**
  - Blast Furnace of Union Steel Corporation of South Africa, Ltd.,* Feb 16 p 519; May 17 p 1408
- **Ahlbrandt, C. F.:**
  - Early Rolling of Sheets, May 10 p 1355
- **Aircraft:**
  - Importance to Metal Industries*, Jan 5 p 14
  - Steel for Construction of, Mar 8 p 709
- **Airplanes:**
  - Chrome-Molybdenum Steel in Construction*, Apr 19 p 1076
  - Commercial Air Routes, May 3 p 1250
  - Exports 1927, Mar 29 p 881; First Quarter 1928, June 7 p 1629
  - Flying Apace (Editorial), June 7 p 1624; June 14 p 1705
  - Manufacture, Jan 5 p 17; May 31 p 1555
  - Steel Shipped by*, Feb 2 p 378
  - Ten Years of Air Mail, May 10 p 1316
  - Tubing Inspection*, Jan 19 p 201
  - What Price? June 14 p 1705
- **Ajax-Northrup Furnace:**
  - Makes High-Speed Steel*, June 7 p 1619
- **Alexander, Magnus W.:**
  - Mechanization of Industry, May 24 p 1489
  - Profitless Prosperity, May 8 p 660
  - Sound Competition Is Prime Need, Jan 26 p 278
  - Unemployment Not Machine Made, Mar 15 p 733; May 3 p 1246
- **Algoma Steel Corporation:**
  - Expansion Plans, Jan 19 p 208
  - Rail Mill Practice, Mar 8 p 709
- **Allen, Edgar, & Co., Inc.:**
  - Stag Major High Speed Steel*, June 7 p 1619
- **Alliance Tank Co.:**
  - Steel Building with Corrugated Sheets Welded On*, Mar 8 p 671
- **Allis-Chalmers Mfg. Co.:**
  - Centrifugal Pump with Motor*, Jan 12 p 139
  - Line Start Induction Motors*, Feb 23 p 540
- **Alloy Steel:**
  - Bar Prices with Common Base, Mar 15 p 747
  - Bearings for Railroads*, Jan 12 p 130
  - Case Hardening with Ammonia, Feb 23 p 538
  - Chrome, Low Temperature for Refining, June 28 p 1817
  - Chrome-Molybdenum in Airplane Construction*, Apr 19 p 1076
  - Chromium-Nickel, Toughness*, Feb 23 p 536
  - Engineering Trends in, Mar 1 p 613
  - Ingot and Casting Production 1927, May 10 p 1333
  - Low Manganese*, Mar 29 p 864, (Editorial) p 896
  - Manufacture of, May 31 p 1532
  - Nickel-Chrome for Rivets, Feb 23 p 572
  - Nickel, For Boiler Construction*, Feb 23 p 537; Mar 1 p 598
  - Welding*, May 3 p 1242
- **Alloys:**
  - Cast Chrome Irons, Feb 23 p 535
  - Copper, Useful Old and New, Apr 12 p 1009
  - Forged Y Pistons on Fastest Airplane, June 14 p 1724
  - Iron, Research, May 31 p 1534
  - Iron-Silicon Equilibrium Diagram*, Mar 15 p 730
  - Magnetic, Names and Definitions, Feb 23 p 534
  - New—Call It by Its Right Name (Editorial), June 28 p 1836
  - Nomenclature—Nickel Silver (Editorial), Apr 5 p 961; May 10 p 1341
  - Ultralumin, New German, Mar 29 p 888
  - Welding Chrome Iron and Steel*, May 3 p 1242
- **Aluminum:**
  - Production 1927, May 10 p 1334
  - Secondary, Mar 8 p 658
- **Aluminum Co. of America:**
  - Charged with Violation of Clayton Act, Hearing, May 31 p 1547
- **Amalgamated Association:**
  - New Wage Scale, Apr 26 p 1193
- **American Arbitration Association:**
  - Schwab, Charles M., Guest of Honor, Jan 12 p 167B
- **American Brake Shoe & Foundry Co.:**
  - Equipment Installation Without Shutdown, Mar 1 p 601
  - Merger with National Bearing Metals Corporation, Apr 12 p 1029
- **American Broach & Machine Co.:**
  - Broaching Machine with Variable Speeds*, Feb 23 p 541
  - Hydraulic Axle-Housing Broaching Machine*, Mar 22 p 806
  - Pull-Type Vertical Broaching Machine*, Apr 12 p 1017
- **American Cable Co.:**
  - Flexible Bolt*, May 17 p 1394
- **American Can Co.:**
  - Canco Power Presses*, June 28 p 1820
- **American Electric Motor Co.:**
  - Inclosed Motor*, Apr 26 p 1158
- **American Electrochemical Society:**
  - Convention Proceedings, May 3 p 1251
- **American Engineering Council:**
  - Berresford, A. W., President, Jan 19 p 240
- **American Foundry Co.:**
  - Modernizes Plant and Institutes Four-Shift Day*, Jan 19 p 187
- **American Foundry Equipment Co.:**
  - Blast-Tumbling Device*, May 3 p 1234
  - Sand Preparator Screen*, May 3 p 1236
- **American Foundrymen's Association**
  - (See Foundrymen's Associations)
- **American Gas Association:**
  - Fellowship to Study Cores, May 17 p 1406
- **American Gear Manufacturers Association:**
  - Convention Proceedings, Apr 26 p 1147
- **American Gray Iron Institute:**
  - Directors and Officers, May 24 p 1476
  - Organization Committee, Apr 19 p 1100
  - Organized, Mar 15 p 777; (Editorial), Mar 22 p 814
- **American Institute of Mining an Metallurgical Engineers:**
  - Convention Proceedings, Mar 1 p 594
  - Forms Steel Division, May 31 p 1546
  - Invites British Institute of Metal to Hold Joint Meeting in Unite States, May 31 p 1571
  - Meeting of Open-Hearth Com mittee, May 10 p 1317; May 1 p 1387
- **American Institute of Steel Construction:**
  - Field Engineers to Promote Structural Industry, May 31 p 153
- **American Iron and Steel Institute:**
  - Convention Proceedings, May 31 p 1528
  - Ferroalloy Production 1927, Apr 5 p 990
  - Finished Iron and Steel Productio 1927, May 17 p 1401
  - New Honorary Vice-President an Directors, May 10 p 1365
  - Pig Iron and Steel Capacities 1927 Apr 26 p 1162
  - Pig Iron Production 1927, Apr 5 p 990
  - Rail Production 1927, Apr 5 p 98
  - Steel Ingot and Castings Production 1927, May 10 p 1333
  - Steel Ingot Production by Month December and Year*, p 167C January, p 414; February, 751; March, p 1023; April, 1329; May, p 1699
  - To Found E. H. Gary Medal, Ma 31 p 1529
- **American Locomotive Co.:**
  - Manufacture of Locomotive Forgings*, Jan 12 p 127; Jan 19 255
- **American Management Association:**
  - Convention Proceedings, Feb 16 463; Apr 5 p 963; May 3 1249; June 14 p 1676

nerican Pig Iron Association:
Discontinues Statistical Activities, Jan 19 p 233
nerican Refractories Institute:
Annual Meeting, May 17 p 1431
nerican Rolling Mill Co.:
Annual Report, Mar 1 p 626
Plant Expenditures at Butler, Apr 26 p 1152
Refinancing Program, Jan 5 p 110
Sells Natural Gas Rights in Kentucky, Feb 16 p 487
Training Minor Operating Executives, June 14 p 1683
nerican Sheet Opener Corporation:
Sheet Pack Opener*, Jan 26 p 271
nerican Society for Steel Treating:
929 Convention Announcement, Feb 16 p 481
Chapter Election of Officers, May 24 p 1472; May 31 p 1544; June 7 p 1618
Proceedings of Winter Sectional Meeting*, Feb 23 p 535
nerican Society for Testing Materials:
Convention Program, May 17 p 1406
Group Meeting Proceedings, Mar 29 p 871
To Study Use of Specifications in Market Quotations, Apr 12 p 1024
nerican Society of Mechanical Engineers:
Fuels Division Meeting Announcement, May 17 p 1415
Machine Shop Practice Meeting*, Mar 22 pp 794, 809; Apr 12 p 1015
Materials Handling Meeting, Apr 26 p 1169; May 3 p 1217
National Machine Shop Practice Meeting Announcement, May 10 p 1330
Nominations, May 24 p 1476
Spring Convention Proceedings, May 17 p 1434; May 24 pp 1466, 1476
To Hold Aeronautical Meeting, June 21 p 1765
nerican Steel and Heavy Hardware Association:
Convention Proceedings, May 31 p 1535
nerican Steel & Wire Co.:
Blast Furnace Production Record, Mar 8 p 685
Keefe, John S., President, Jan 5 p 85
Studies Special Properties of Wire, Apr 5 p 932
nerican Supply and Machinery Manufacturers' Association:
Convention Proceedings, May 24 p 1470
nerican Welding Society:
Convention Proceedings, May 3 p 1244
nerican Zinc Institute:
Convention Proceedings, Apr 26 p 1146
nes Shovel & Tool Co.:
To Concentrate Manufacturing at Two Plants, June 21 p 1763
nderson and Bessemer:
Carbon and Silicon Variations in Cast Iron, May 24 p 1449
ndrews-Bradshaw Co.:
Merges with Blaw-Knox Co., Jan 26 p 277
Pipe Line Tracyfier*, Feb 23 p 540
nealing:
(See also Heat Treatment)
Special, Definition of Term Wanted, Feb 23 p 539
pex Machine Co.:
Chuck, Vertical Float Friction Drive*, June 14, p 1688
pprentices
Trained Through Community Effort, May 24 p 1459
Training at East Chicago, June 7 p 1601
Associated Machine Tool Dealers:
Convention Announcement, Apr 26 p 1192
Association of Iron and Steel Electrical Engineers:
Electrical Steel Mill Developments, June 28 p 1807
Meetings, Apr 5 943; June 7 p 1651
Welding Committee, Apr 26 p 1161
Auel, C. B.:
Broadening of Safety Work, Apr 19 p 1079
Australian Iron & Steel Co., Ltd.:
Organized, May 3 p 1292
Austria:
Iron and Steel Production 1927, May 31 p 1577
Magnesite Exports, May 3 p 1277
Automobiles:
Automatic Production of Frames in Smith Plant*, Mar 22 p 794, (Editorial) p 815
Demand in Future (Editorial), May 24 p 1487
Manufacture of Frames in Ford Plant*, Apr 26 p 1141
Production, 1927*, p 46; January, p 615; February (Editorial), p 754, p 809; March, p 1196; April, p 1512; May, p 1839
Production 1922-1928 (Editorial), June 28 p 1837
Production 1923-1927, Jan 26 p 312
Registrations 1927, Jan 19 p 238
Supply and Demand, 1923-1928 (Editorial), Apr 26 p 1167
What Price Trade? (Editorial), Jan 19 p 218
Automotive Industry:
Outlook 1928, Jan 5 p 45
Axle Failures:
From Hot Boxes*, Mar 22 p 808

B

Bailey and Evans:
Blast Furnace Operation, May 17 p 1408
Bailey, G. L.:
Blowholes in Brass, Mar 29 p 873
Bain, Edgar C.:
X-Ray and Constituents of Stainless Steel*, Feb 23 p 535
Baker Brothers, Inc.:
Boring and Drilling Machine, Hydraulic Feed*, June 14 p 1689
Boring Machine with Hydraulic Feed*, Mar 22 p 806
Baker-Raulang Co.:
Foundry Trucks*, May 3 p 1235
Balance of Trade:
Sustained by External Loans and Purchase of Foreign Securities, May 10 p 1309; May 17 p 1414
Baldwin Locomotive Works:
Light-Weight Oil-Electric Locomotive, June 21 p 1785
Bales, C. E.:
Cupola Refractories, May 24 p 1452
Baremore, R. W.:
Lunch System in Budd Plant*, Apr 12 p 1033
Barometers of Industry (Editorial), Feb 16 p 486
Bars:
Alloy Steel, with Common Base Price, Mar 15 p 747
Reinforcing, Displacing Structural Steel*, Mar 15 p 725
Reinforcing, Tariff, Feb 16 p 512; April 12 p 1040; Apr 19 p 1098; June 21 p 1762
Bassett, William H.:
Useful Copper Alloys, Apr 12 p 1009
Battelle Memorial Institute:
Industrial Research, Jan 19 p 212
Bauxite:
Production 1927, May 31 p 1548
Beaded Ribs on a Pattern*, Mar 15 p 738
Bearings:
Alloy, For Railroads*, Jan 12 p 130
Bronze, For Heavy Duty, June 7 p 1599
Roller, Reduce Power Waste*, Jan 26 p 259
Beatty, A. J.:
Training Minor Operating Executives, June 14 p 1683
Beckensale and Waterhouse:
Lead Cable Sheathing Deterioration, Apr 5 p 947
Becker, Dr. J.:
Warns Against Quickly Applied Chromium Plating, Apr 5 p 940
Beebe, F. H.:
All-Welded Gas Holder*, Apr 5 p 941
Belfont Steel & Wire Co.:
Merger Planned with Marting and Norton Companies, Feb 16 p 492
Bench Machine:
Niagara, for Turning, Wiring and Burring*, May 10 p 1326
Berkshire and Winne:
Synchronous Motors for Rolling Mills*, Feb 23 p 529
Berresford, A. W.:
President American Engineering Council, Jan 19 p 240
Berry, Sir William:
Low-Manganese Plates for Shipbuilding, June 28 p 1813
Beryllium:
Copper Hardened with, Mar 29 p 873
Bessemer and Anderson:
Carbon and Silicon Variations in Cast Iron, May 24 p 1449
Bethlehem Steel Co.:
Making 33-In. Beams and Girders, May 24 p 1483
New Section of Lackawanna Piling*, May 10 p 1355
Bethlehem Steel Corporation:
Annual Report, Mar 22 p 845
Cash Prizes in Accident Prevention, Jan 12 p 156; June 28 p 1806
Offers Stock to Employees, Feb 9 p 439
Pipe Mills at Sparrows Point*, Apr 19 p 1084
Safety Report, May 3 p 1282
Bevel:
Brown & Sharpe Combination*, June 7 p 1615
Bibliography:
Mechanical Springs, Mar 15 p 769
Bidle, W. S., Co.:
Rivet Set for Standard Hammer Barrels*, Feb 9 p 410
Bilby, J. S.:
Steel Replacing Wood in Survey Towers*, Mar 15 p 756
Blast Tumbling Device:
American Foundry for Quick Loading*, May 3 p 1234
Blowing Equipment:
General Electric Cupola*, May 3 p 1237
Bilton Machine Tool Co.:
Taken Over by Producto Machine Co., Apr 12 p 1029
Birdsboro Steel Foundry & Machine Co.:
Double Plate Turn-Over*, June 14 p 1668
Bissell, A. G.:
Arc Welded Railroad Bridge*, Apr 12 p 1013
Black & Decker Mfg. Co.:
Acquires Van Dorn Electric Co., Jan 12 p 167B
Electric Glue Pot*, Apr 26 p 1158
Blackmar, Don C.:
Production of Ingot Brass and Bronze, Mar 8 p 658
Sorting Non-Ferrous Scrap, Apr 5 p 954
Blacksmithing:
Skill Still Essential (Editorial), Jan 26 p 284
Blakey, M. A.:
Testing Molding Sands for Durability, May 24 p 1457

254146

- **Blaw-Knox Co.:**
  - Merges with Andrews Bradshaw Co., Jan 26 p 277
- **Bliss, E. W., Co.:**
  - Cold Rolling Mills, June 7 p 1651
  - Double-Action Power Press*, Feb 2 p 339
- **Blood, H. L.:**
  - Centerless Grinders with Automatic Feeding Devices*, Apr 12 p 1015
- **Blowholes:**
  - In Brass, Cause of, Mar 29 p 873
- **Blowpipe:**
  - Oxweld Cutting*, Feb 16 p 473
- **Boiler Plate:**
  - Embrittlement, June 28 pp 1825, 1831
- **Boilers:**
  - Corrosion Problems, Jan 26 p 262
  - Nickel Steel for Construction*, Feb 23 p 537; Mar 1 p 598
  - Waste Heat in Steel Mill, June 7 p 1605
- **Bolivia:**
  - Tin Industry Hit by Low Prices, Apr 5 p 951
- **Bollinger-Andrews Construction Co.:**
  - In Receivership, Mar 15 p 750
- **Bolt Threader:**
  - Williams Double-Head*, Jan 26 p 274
- **Bolton, J. W.:**
  - Research Problems of Gray Iron Foundry, May 24 p 1451
- **Bolts:**
  - American Flexible*, May 16 p 1394
- **Bonuses:**
  - Foremen, in A. O. Smith Plant*, May 24 p 1445
  - Individual and Group Incentive Systems, June 14 p 1676
  - To Increase Production of Salable Castings, May 24 p 1458
- **Book Reviews:**
  - 1928 Year Book of American Engineering Standards Committee, June 6 p 1627
  - Aluminum—the Metal and Its Alloy (A Critical Descriptive Treatise), June 28 p 1826
  - Automobile Industry, Apr 26 p 1194
  - Blue Book of Southern Progress, May 31 p 1560
  - Business Statistics, Record Book, Mar 15 p 769
  - Care and Operation of Machine Tools, Feb 9 p 412
  - Cements, Limes and Plasters, June 28 p 1827
  - Commercial Survey of Southeast, Jan 19 p 190
  - Economics of Instalment Buying, Feb 23 p 577
  - Electric Industrial Trucks and Tractors in Industry, Feb 9 p 413
  - Engineering Index for 1927, June 28 p 1826
  - Facts and Figures of the Automobile Industry, May 17 p 1402
  - Foreign Commerce Handbook, Mar 15 p 779
  - Foremanship Training, Feb 9 p 411
  - Handbook of Iron and Steel Foundry Work, Feb 9 p 412
  - Holland Tunnel Ventilation, Feb 9 p 413
  - Logic of Modern Physics, Apr 26 p 1194
  - Mechanics of Machinery, Feb 9 p 412
  - Metal Statistics for 1928, Apr 19 p 1094
  - Metallographic Atlas, Feb 9 p 411
  - Metallography, Feb 9 p 411
  - Metallurgy of Iron and Steel, June 28 p 1826
  - Old Sox on Trumpeting, Aug 26 p 1195
  - Organizing the Drafting Department, Feb 9 p 411
  - Pearlitic Cast Iron, Apr 26 p 1194
  - Plating and Coloring, Feb 9 p 412
  - Protective Metallic Coatings, June 28 p 1827
  - Standard Yearbook, 1928, June 14 p 1717
  - Statistical Abstract of United States, 1926, Mar 15 p 743
  - Steel Construction, Feb 9 p 413
  - Steel Frame Dwellings, Apr 26 p 1193
  - Steel—Its Part in American Progress, Mar 29 p 891
  - Trade Association Activities, Jan 19 p 212
- **Books Received**, Feb 9 p 413; Apr 26 p 1195; June 28 p 1827
- **Borden Co.:**
  - Adjustable Die Stocks*, June 7 p 1616
- **Boring Bar:**
  - Larkin Packer Extension*, Mar 8 p 672
- **Boring and Turning Mill:**
  - Niles, with Thread-Chasing Attachment*, Jan 26 p 274
- **Boring Machine:**
  - Baker No. 10-H Drilling and*, June 14 p 1689
  - Baker, with Hydraulic Feed*, Mar 22 p 806
  - Defiance Single-Purpose*, Feb 16 p 474
  - Moline Cylinder*, Mar 1 p 604
- **Bornstein, Hyman:**
  - Power Farming Development*, Jan 5 p 18
- **Bossert, T. W.:**
  - Overheated Aluminum Sand Castings, May 24 p 1461
- **Boston Gear Works Sales Co.:**
  - Gear Reduction Unit*, June 28 p 1824
  - Self-Alining Hangers*, June 28 p 1823
  - Standardized Chain Drives*, June 28 p 1824
- **Bourne-Fuller Co.:**
  - Merchant Bar Mill*, Feb 2 p 325
- **Bowles, Oliver:**
  - Metallurgy of Limestone and Dolomite, Mar 1 p 595
- **Boylston, H. N.:**
  - Service Best Test of Steel*, June 14 p 1665
- **Boynton, Arthur J.:**
  - Gas Washing, Mar 1 p 595
- **Boynton, H. C.:**
  - Bridge Wire Tested After 75 Years, Feb 9 p 400
- **Brackets:**
  - Stearns for Belt Conveyors*, Apr 19 p 1090
- **Brakes:**
  - Cincinnati All-Steel Press*, May 10 p 1327
  - General Electric Solenoid, Apr 5 p 957
- **Braman, H. S.:**
  - Dry Cleaning of Gas, Feb 23 p 547
- **Brass:**
  - Ingot Production, Mar 8 p 658
- **Bray, Thomas J.:**
  - Resigns Presidency Republic Iron & Steel Co.*, Apr 19 p 1131
- **Brick:**
  - With Bias Ends*, Jan 19 p 196
- **Bridges:**
  - Arc Welded Railroad*, Apr 12 p 1013
  - Boston & Maine Arc-Welded, June 21 p 1795
  - Construction 1927, Jan 5 p 44
  - Welding for Repairing Corroded, Mar 8 p 677
- **Bristol Co.:**
  - Recorder Controller, June 28 p 1825
- **British Empire Steel Corporation:**
  - Acquired by Holt, Gundy & Co., Feb 9 p 419; Reorganization Planned, Apr 5 p 977
- **Broaching Machine:**
  - American Hydraulic Axle-Housing*, Mar 22 p 806
  - American Vertical Pull-Type*, Apr 12 p 1017
  - American, with Variable Speeds*, Feb 23 p 541
- **Bronze:**
  - Ingot Production, Mar 8 p 658
  - Railroad Bearing, Laboratory Tests, June 21 p 1750
- **Brooke, E. & G., Co.:**
  - Sintering Low-Grade Ores*, Mar 8 p 668
- **Brown & Sharpe Mfg. Co.:**
  - Automatic Rod Magazine*, Apr 19 p 1091
  - Combination Bevel*, June 7 p 1615
  - Gear Cutting Machine, Improved*, Apr 26 p 1158
  - Heavy-Duty Plain Grinders*, May 24 p 1479
  - Micrometer Calipers*, May 10 p 1326
  - Milling Machines, New*, Jan 19 p 204
- **Brown and De Witt:**
  - Influence of Ferric Hydrogel in Bond of Natural Molding Sands, Cause of Decrease in Bond Strength, Automatic Precision Strength Test for Sand, May 24 p 1455
- **Brown, Donaldson:**
  - Forecasting Methods of General Motors Corporation, May 10 p 1321
- **Bruere, Henry:**
  - Small Manufacturer Must Be Better Business Man in 1928, Jan 5 p 22
- **Brush, H. M.:**
  - Copper, 1927, Jan 5 p 72
- **Bucket:**
  - Harnischfeger Heavy-Duty Drag Line*, Mar 8 p 675
- **Buckeye Portable Tool Co.:**
  - Pneumatic Grinder*, May 3 p 1240
- **Budd, Edward G., Mfg. Co.:**
  - Lunch System*, Apr 12 p 1003
- **Budget Plan:**
  - In Stutz Plant*, May 17 p 1378
- **Buffalo Forge Co.:**
  - Combination Punch, Slitting Shear and Bar Cutter*, Apr 5 p 947
- **Building:**
  - Contracts, December, p 190; January, p 478; February, p 743; March, p 1114; April, p 1400; May, p 1729
  - Forecast for 1928*, Jan 5 p 43
  - Steel for Normal Needs (Editorial), Mar 8 p 683
  - Outlook, May 3 p 1258
- **Bullock, Dr. Charles J.:**
  - Industrial Profits, May 3 p 1246
- **Bureau of Labor:**
  - Report on Unemployment, Mar 29 p 890
- **Bureau of Mines:**
  - Motion Picture "Story of Iron," Mar 15 p 739
- **Bureau of Standards:**
  - Report on Simplified Practice, Feb 2 p 376
  - Standard Samples of Metals, Mar 15 p 732
- **Burnet, L. H.:**
  - Economic Value of Safety Work, June 21 p 1745
- **Burr, W. H.:**
  - Electrical Steel Mill Developments, June 28 p 1807
- **Burrows, Stay and Hobbs:**
  - Remelting Secondary Aluminum, Mar 8 p 658

THE IRON AGE

New York, January 5, 1928

ESTABLISHED 1855 VOL. 120, No. 1

Steel Trade Now Looks to 1928 to Compensate for Some of the Recession of 1927—Forces That May Make for Greater Market Stability

¶ *Nineteen twenty-seven in the steel industry showed early signs of falling behind* 1926. *With a steel ingot output of about* 43,250,000 *tons, it was* 8 *per cent under the* 46,936,000-*ton peak of the year before.*

¶ *Prices declined most of the year, and earnings were quite below those for* 1926, *in spite of the signs a year ago that steel companies were about to curb price cutting.*

¶ THE IRON AGE *composite price for finished steel averaged* 2.357*c. per lb. for the year; it was* 2.439*c. in* 1926. *Thus the year's average fell off* $1.64 *a net ton, whereas the* 1926 *average was only* 52*c. a ton under that of* 1925.

¶ *In the sheet and strip trades the revolution of continuous rolling by patented methods made the year memorable, pointing to ultimate centering of production in large companies.*

¶ *Pig iron last year sold lower than at any time since August,* 1916. *Our pig iron composite, as the year opened, was* $19.71 *per ton, and at the year's end* $17.54. *Pig iron output was about* 36,400,000 *tons; in* 1926 *it was* 39,373,000 *tons.*

¶ *With outlay for new iron and steel plant much curtailed and with production in fewer hands, the trend is toward a more stable market.*

MORE factors in the steel trade outlook for 1928 are difficult to estimate than was the case at the beginning of 1927, or of 1926 or 1925. Yet there are good reasons for the expectation that it will be a year of large activity and, barring untoward developments of which present tendencies give no sign, conforming in the main to a composite of the three years last past. Wide fluctuations from year to year are no longer likely. Counting 58,000,000 tons of ingots as theoretical capacity, 1926 was an 81 per cent year and 1927 a 74.5 per cent year.

One year ago it was said in THE IRON AGE's forecast that the expectations of the steel trade as it entered 1927 were not so high pitched as at the beginning of 1926, but that almost without exception there was the added opinion that no important recession was likely in the twelve-month. It was felt that since 1926 had outrun the high record of 1925, making two successive peak years, it would be breaking all precedents (apart from the war-time triennium 1915, 1916 and 1917) to have a new top in 1927.

Also there was warrant for the view that 1926 had brought some over-expansion of trade for which a compensating toll might be taken from 1927. The automobile industry was particularly in mind in this connection, but the recession there proved to be more than was looked for, due largely to the protracted suspension of production by Henry Ford.

Possible Compensations in 1928

Today, following the reasoning of a year ago, there is ground for the view that, as 1927 showed a recession from the very high peak of 1926, some lines of steel consumption may be expected to compensate in 1928 for what they lacked in the year just ended. Automobile and railroad demand, alike disappointing in 1927, are both counted on for increases, and the improvement agricultural machinery plants had in 1927 promises to go further. Steel construction in heavy lines need not be expected to exceed, and may not equal, the large scale of 1927. The pipe trade looks forward to another year substantially like 1927 in falling short of the peak consumption of 1926.

Is Greater Market Stability in the Making?

Reading consecutively at the year-end the weekly market reviews of THE IRON AGE for 1927 one sees that it was a year in which improvement in steel prices and consumption was constantly expected but not realized. Yet several things have been in the making, even in these past nine months of recession, that may turn out on the side of price betterment in 1928.

First, is the series of efforts producers have made to get various finished products out of the low-price cuts. While the extent of their success is largely for the future to determine, these efforts have kept constantly before both sellers and buyers the aim of the manufacturers to get prices yielding a fair profit and have tended to lessen the strain for tonnages at the expense of prices.

CONSOLIDATION TENDENCY MORE PRONOUNCED

In the second place, progress has been made in the direction of consolidation in the past year, reducing to that extent the scramble for profitless tonnage. Following the merger in July, 1926, of the Central Steel Co., Massillon, Ohio, and the United Alloy Steel Corporation, Canton, Ohio, with combined ingot capacity of 1,150,000 tons a year and assets of $80,000,000, there were persistent reports of further concentration of steel capacity in northern Ohio. The Otis, Corrigan-McKinney and Trumbull companies were commonly mentioned in connection with these plans. The expected amalgamation did not come, however, but in November the Republic Iron & Steel Co. acquired the Trumbull Steel Co., bringing the ingot capacity of the former up to 1,900,000 tons a year.

In July the American Rolling Mill Co. purchased the properties, business and patents of the Columbia Steel Co., Butler, Pa., the combined capacity of the two companies being 1,000,000 tons of sheets and stripsheets a year.

Negotiations have been under way for some time which are expected to bring about the early merger of the Columbia Steel Corporation and the Pacific Coast Steel Co., both of San Francisco, and having gross assets above $35,000,000.

On the last day of the year announcement was made that the Youngstown Sheet & Tube Co. would acquire the Inland Steel Co., the strong Chicago district independent, which Eastern steel interests had more than once sought to acquire with its ingot capacity of more than 1,500,000 tons. Then in northern Ohio a merger of six sheet and tin-plate producers was consummated in December and the Empire Steel Corporation was formed—a move that should aid in the effort to save the sheet industry from disastrous price cutting.

LITTLE NEW CAPACITY BUILDING

A third factor making for more stability in the industry is the limited scale of the additions made last year, or planned for this year, to the country's steel-making capacity. In the four years after it acquired the Midvale and Lackawanna companies the Bethlehem Steel Corporation spent $80,000,000 on new construction and improvements to increase output. The Steel Corporation appropriations in 1924, 1925 and 1926 were $75,000,000 for the building of new capacity. The past year has shown a sharp falling off in new construction; in the coming year relatively little will be done. Excess capacity will be less in evidence and demand will grow into healthier relation to supply.

A fourth constructive development of the year was the beginning of continuous sheet manufacture on a large scale. While, on its face, continuous sheet and strip rolling suggests destructive competition and the eventual elimination of smaller mills, there are indications that the patent situation will be so handled by the granting of licenses that the continuous mill may tend rather to the stabilizing of the very important market for the thinner products.

Unbalanced Steel Demand Last Year

The forecast of some leading members of the steel trade that demand in 1927 would run something like 10 per cent less than in 1926 turned out to be fairly accurate. Ingot production, as indicated on the preceding page, was about 8 per cent below that of 1926. When we consider the lack of railroad equipment buying, the slump in automobile production, the depression in the oil fields, the bituminous coal strike, the Mississippi flood, and the widespread handicap of unseasonable weather, the 1927 performance of the steel industry was remarkable. With the railroad, automobile and oil demands so unsatisfactory as all were last year it is evident that the miscellaneous and unclassified industries furnished nearly as much business as in 1926.

New uses of steel are adding to each year's demand. Steel furniture, steel sanitary equipment, steel sash and steel frame dwellings are examples. The steel requirements for craft on the Monongahela, Ohio and Mississippi Rivers are increasing. Perhaps 70,000 tons was so taken in 1927. The work of the Sheet Steel Trade Extension Committee no doubt prevented a considerable falling off in sheet consumption. The revolution in farm equipment brought on increased use of steel from that quarter last year and this promises to be greater in 1928.

SMALLEST STEEL REQUIREMENTS FOR NEW CARS SINCE 1921

Capital expenditures by the railroads were only $750,000,000 in 1927, or more than 15 per cent below those of 1926, and the decrease was reflected in nearly all steel purchases except rails. The number of freight cars ordered for domestic steam railroad use was 71,606, including those authorized for construction in railroad companies' own shops. While this was a slight gain over the 67,000 bought in 1926, it fell considerably below 78,000 ordered in 1925 and 135,000 in 1924.

A closer gage of the decline in actual steel consumption for freight cars last year is afforded by the total of 63,390 cars built and delivered by car builders and railroad car shops, 1927 being the least active year in this respect since 1921. In the preceding year 79,000 were built, while 94,000 was the total for 1925 and 104,000 for 1924.

Only 808 locomotives were ordered during the year, including export orders, and 1176 were built. Of those ordered 696 were for domestic use, as against 1301 in 1926, while 958 were built for domestic use compared with 1585 in 1926.

Railroads built 779 miles of new main line, but tore up 202 miles, leaving a net gain in trackage of 577 miles.

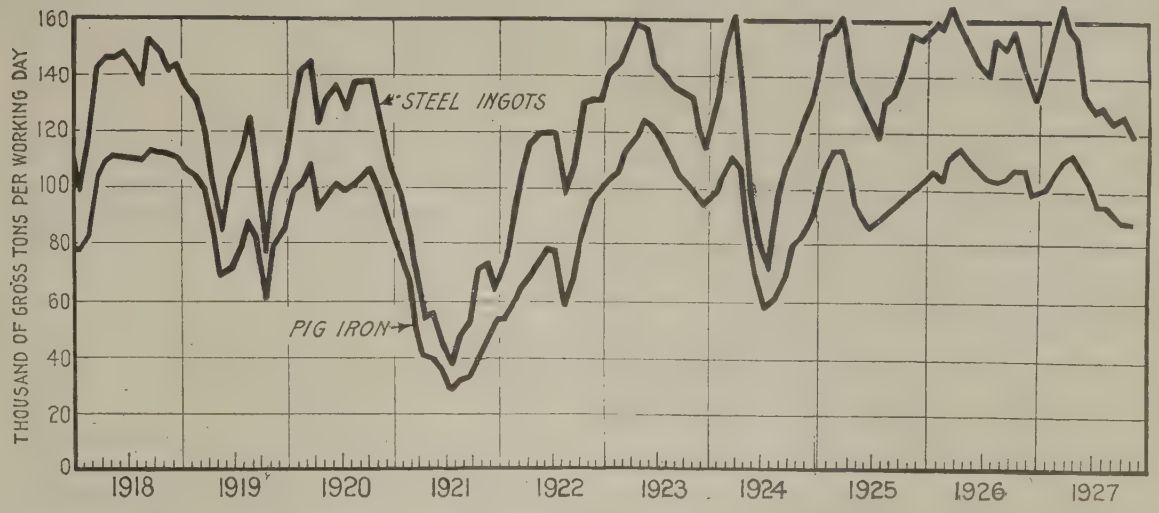
FABRICATORS' ORDERS MORE BUT SHIPMENTS LESS

A high rate of building construction is reflected by the figures collected by the Department of Commerce on 1927 contracts for fabricated structural steel. Computed bookings, based on returns from a large percentage of the fabricators, showed a total of 2,521,740 tons for 11 months and, with December estimated, the year will show approximately 2,725,000 tons, a gain of a little less than 8 per cent, compared with 2,523,250 tons in 1926 and 2,425,612 tons in 1925. Shipments last year ran more than 200,000 tons below those of 1926; in that year shipments exceeded orders.

Elsewhere the automobile, railroad, new construction and oil well and pipe line consumption of steel in 1927 is referred to, each field having a separate article. The estimate of motor cars and trucks built in the United States last year is 3,350,000, as against 4,255,000 in 1926.

Output Curve Had No Autumn Upturn

On page 3 the course of steel production last year is shown in a curve which is in contrast with those of the previous three years. All advance in the early months of the year to a March peak, then decline in spring and summer, ascending again in the autumn. The 1927 curve, however, did not turn up last fall and in that particular, as in others, it paralleled the movement of 1923. Indications now point to a continuation of the parallel, which would give in the next three months some such increase in operations as was seen in the first quarter of 1924, and was repeated in each of the three following years.



Fluctuations in Daily Average Production of Steel Ingots and of Pig Iron, During the Past Ten Years. While generally parallel, the curves are farther apart than formerly, much farther than in 1921, for instance. They are based on monthly ingot figures of the American and Steel Institute and monthly pig iron figures gathered by THE IRON AGE. *Ingots have fallen far below the high record of 1926 but the year was above the 1923-1926 average. Pig iron is 2 per cent below the average of those four years*

The year's steel ingot output THE IRON AGE estimates at 43,250,000 gross tons and that of steel castings at 1,250,000 tons (against 1,300,000 tons in 1926), making the 1927 total of ingots and steel castings about 44,500,000 tons, which compares with 48,294,000 tons in 1926.

March a Record Month in Steel

Outputs of steel ingots and pig iron are given below for 1927 and the preceding 10 years, including the last two years of the war period:

	Pig Iron, Gross Tons	Steel Ingots, Gross Tons	Steel Ingots and Castings, Gross Tons
1917........	38,621,216	43,619,200	45,060,607
1918........	39,054,644	43,051,022	44,462,432
1919........	31,015,364	33,694,795	34,671,232
1920........	36,925,987	40,881,392	42,132,934
1921........	16,688,126	19,224,084	19,783,797
1922........	27,219,904	34,568,418	35,602,926
1923........	40,361,146	43,485,665	44,943,696
1924........	31,405,790	36,811,157	37,931,939
1925........	36,700,566	44,140,738	45,393,524
1926........	39,372,729	46,936,205	48,293,763
1927........	36,400,000	43,250,000	44,500,000

On April 1, union miners in the bituminous coal fields struck to enforce their demand for the maintenance of the so-called Jacksonville scale and the strike lasted through the year except for a tentative adjustment in the Illinois district. Stocks of coal had been accumulated before the strike and non-union mines increased their operations to such an extent that there was a plentiful supply of coal throughout the year. Iron and steel production were in nowise affected by the strike and at no time did the market for coal and coke show strength.

Last year has the distinction of the largest ingot output ever made in a month—4,499,092 tons in March. The scarcely interrupted decline in the daily rate of steel ingot production that began in April is shown below in the statistics of the American Iron and Steel Institute:

Months, 1927	Daily Production, Gross Tons	Months, 1927	Daily Production, Gross Tons
January	144,611	July	127,134
February	157,557	August	128,552
March	166,633	September	124,312
April	157,494	October	126,500
May	157,430	November	119,299
June	133,387	December	......

A Hard Year for Pig Iron Producers

In pig iron production, 1927 ranks eighth among the high years, having been exceeded by 1916 and by every year in the succeeding decade except 1919, 1921, 1922 and 1924. We estimate the year's production (including charcoal iron, which is not included in the monthly statistics) at 36,400,000 tons. This compares with 39,372,729 tons in 1926.

The table below gives the number and capacity of furnaces in blast at the beginning of each month. The largest number was 223 on April 1, with a daily capacity of 113,435 tons, and the smallest, 170, on Dec. 1, with a daily capacity of 87,700 tons:

1927	Number In Blast	Daily Capacity Gross Tons	1927	Number In Blast	Daily Capacity Gross Tons
Jan. 1.....	203	98,360	July 1.....	198	100,240
Feb. 1.....	208	100,635	Aug. 1....	190	93,700
March 1...	217	106,135	Sept. 1....	187	93,800
April 1....	223	113,435	Oct. 1.....	179	90,800
May 1.....	220	112,955	Nov. 1....	172	88,300
June 1....	211	107,445	Dec. 1.....	170	87,700

Pig iron production of about 36,400,000 tons (December estimated) in 1927 (including charcoal iron, ferromanganese and spiegeleisen) was the smallest since 1924 and was exceeded in seven preceding years—1916, 1917, 1918, 1920, 1923, 1925 and 1926. Last year's output fell almost 10 per cent below the peak of 40,361,146 tons in 1923.

On Jan. 1, 1927, there were 204 furnaces in blast, while on Dec. 1 the number had declined to 170. Shutting down came rather rapidly in the last half of the year, reflecting not only the diminishing demand for steel, but smaller consumption by iron and steel foundries.

MORE FURNACES ABANDONED

The year brought further scrapping of obsolete furnace capacity, resulting in a net loss of 14 stacks. THE IRON AGE list of Jan. 1, 1927, showed 371 units as against 357 now. Of the 357 existing furnaces, 122 may be definitely rated as in the merchant class. Only 39 of the 122 were in blast on Dec. 1, and many of those which were not then in blast had been idle for the entire year, and doubtless many will go to the scrap heap before the end of 1928. Very little new capacity is being built or planned, so that the end of this year will see a further decline in the country's potential pig iron capacity.

Each year sees the end of the merchant furnace drawing near, and the time is coming when practically all of the iron made for sale will be furnished by the steel companies. The expansion of by-product coke oven capacity has made it necessary for the steel companies to keep blast furnaces going to use up the coke, and it has been cheaper for these companies to keep on making coke and iron, sometimes far in excess of their own requirements, especially in the large, modern furnaces which are capable of making 800 or 900 tons daily over long-extended periods.

PRICES LOWEST SINCE 1916

Pig iron prices showed the lowest year's average since 1916, THE IRON AGE composite price for 1927 averaging $18.55 against $20.42 in 1926, $20.58 in 1925 and $20.90 in 1924. Several months in 1916 had averages below $18. The 1927 composite was more than $7 per ton below the composite average of the eight years, 1919 to 1926, inclusive.

A significant development of the year was the growth of water shipments, together with the invasion of new territories by some furnace interests which would have been wholly at a disadvantage when shipping by rail. The Chicago district was invaded on several occasions by iron from Lake Erie ports. Large shipments from Buffalo were also made to the Detroit district.

EASTERN WATER SHIPMENTS

During the navigation season, shipments of Buffalo iron by New York State barge canal to New York, New Jersey and Connecticut points were more frequent than in preceding years, as Buffalo producers reached out for more territory to offset their loss of business in New England due to the extreme competition of Everett, Mass., Troy and Port Henry, N. Y., furnaces for that market. The Mystic furnace at Everett shipped tens of thousands of tons by barge to cast iron pipe foundries on the Delaware River above Philadelphia. thus competing actively with eastern Pennsylvania furnaces.

Lake Erie furnaces, which for most of the year were making more iron than could be absorbed in their natural territories, reached out to points where they were at a freight rate disadvantage, and in the Cincinnati district they undersold southern Ohio furnaces.

Southern iron, which was held at fairly high prices most of the year, lost some of its northern markets, but late in the year, when the Alabama producers reduced their quotations to the lowest point, with one exception, since October, 1916, they widened their markets somewhat in the territory contiguous to the Ohio River. They did not regain the opportunity, however, to ship iron in sizable quantities to points north of Cincinnati and St. Louis.

CHANGES IN OWNERSHIP

Among the changes of the past year was the acquisition of the Rogers-Brown furnaces at Buffalo by the M. A. Hanna Co., Cleveland. Another major transaction was the purchase of the Hamilton furnace at Hamilton, Ohio, by the Koppers Co. and the American Rolling Mill Co. This furnace will supply hot metal for the latter company's steel plant at Middletown, Ohio, as soon as a connecting railroad can be built. Interests affiliated with the American Rolling Mill Co. also bought the Norton furnace, long a factor in the merchant iron market of southern Ohio, and when modernized it will supply hot metal to the American Rolling Mill Co.'s Ashland, Ohio, plant. The two furnaces of this company at Columbus, Ohio, will not be needed for production of steel-making iron, but their future has not been determined.

MUCH LESS FOREIGN IRON

Foreign iron was less of a factor in the domestic market than in any of the five preceding years. Last year's receipts did not exceed 140,000 tons (last month estimated), while those of other recent years were as follows:

	Tons		Tons
1922	383,445	1925	441,425
1923	367,778	1926	445,773
1924	209,109	1927	118,769 (11 months)

Low prices here and comparatively high prices abroad left so little margin of profit that American brokers were unwilling to buy speculatively. A slight deterrent was the advance of 50 per cent in the tariff. from 75 cents per ton to $1.12½, under the flexible provisions of the tariff act, and a further retarding factor was the application of the anti-dumping duty on German pig iron after an investigation by the Treasury Department.

Scrap Had Small Fluctuations

Low cost of making pig iron in principal steel producing districts has served to keep down prices of heavy steel scrap, but other factors have also been at work, such as reduced consumption and the increased efficiency of the railroads, not only in gathering their own scrap but in transportation from all shipping points. The speculative profits of past years for handlers of scrap have been lacking, as prices of all grades have moved over a very narrow range. THE IRON AGE composite price of heavy melting steel for 1927, taking Pittsburgh, Chicago and Philadelphia markets as the bases, was $14, compared with $15.48 in 1928 and with an eight-year average of $17.35.

Efforts to Steady Prices

Prices had a good deal of attention throughout the year, nearly every product apart from rails having consideration in the effort of producers to stabilize the market. Strip makers announced an advance in February, but previously gave buyers full coverage for the second quarter at the low prices reached just after the turn of the year, and it took until well into the third quarter to complete the shipments on these protections.

In sheets an effort was made to limit the coverage given before an advance announced in the latter part of May. Buyers were given until June 30 to specify at the low prices, but in many cases the period was extended. The outcome was that no great amount of the announced advance was realized upon.

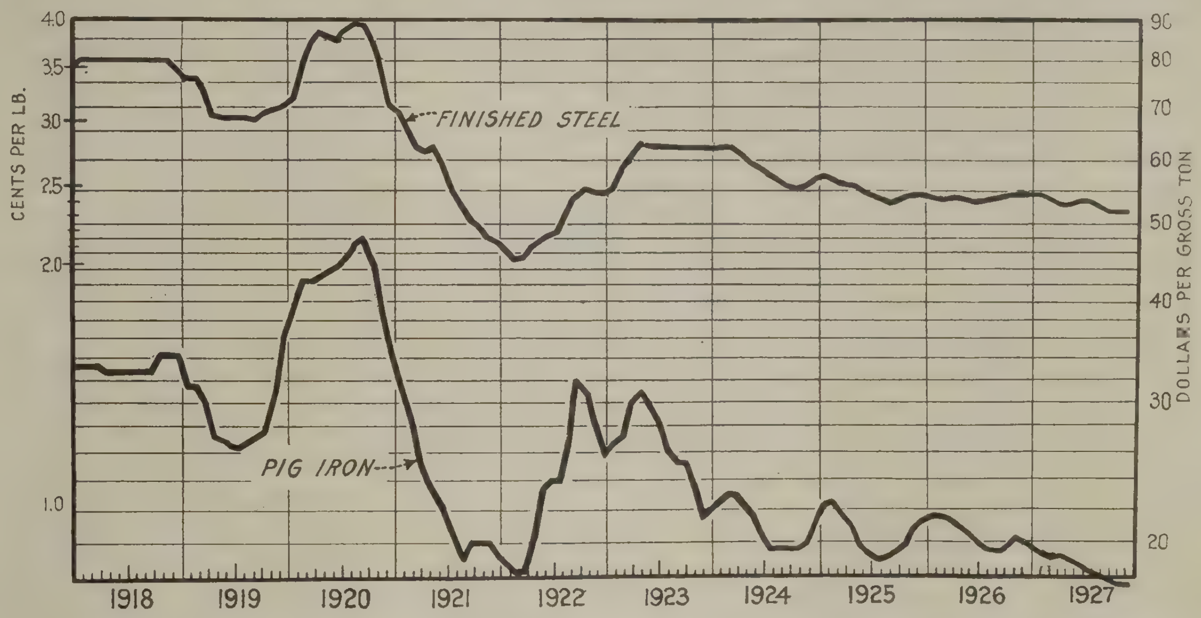
On Nov. 10 the Carnegie Steel Co. advanced plates, shapes and bars $1 a ton, or to 1.80c., Pittsburgh, but there was very general coverage well into the first quarter at the 1.75c. price.

In tin plate a reduction from $5.50 to $5.25 a box was made in December in the contract price which had nominally prevailed for three years. The new price was really an advance over some prices that had commonly been made, and it was announced that it would not be subject to concessions to the extent that had long been practiced.

Wire prices were the subject of an effort to raise the market, but by the end of the year producers had lost the ground that appeared to have been gained.

Generally speaking, it was a year of price weakness, and the average of THE IRON AGE's quotations on seven leading finished steel products was $1.64 per net ton below that of 1926.

Pig iron prices, as appears from the pig iron review on a preceding page, were the lowest since 1916.



Fluctuations Over Post-War Years in THE IRON AGE *Composite Prices of Pig Iron and Finished Steel. The relative stability of finished steel prices, when compared with pig iron, continues to be demonstrated. The highest finished steel composite figure during 1927 was 7 per cent above the lowest; in pig iron the divergence was 12.4 per cent. Since the peak early in 1923, both trends have been downward. Finished steel has lost 18 per cent and pig iron 43 per cent*

Exports Increase While Imports Decrease

Following up the gain made in exports in 1926, there was a further moderate addition to the iron and steel shipments from the United States to foreign countries in 1926. Figures for 11 months show a total of 2,012,541 gross tons, against 1,969,022 tons (11 months) a year earlier. It is true that this increase was accounted for wholly by large exports of scrap which in 11 months of 1927 exceeded the 1926 figure by 118,600 tons. Other products flowed outward in good volume, however, with varying changes from the preceding year.

Increases of 19,000 tons in tin plate, 3000 tons in wire, 25,000 tons in pig iron, and 118,600 tons in scrap were partly offset by decreases of 24,000 tons in bars, 5000 tons in plates, 19,000 tons in galvanized sheets, 12,000 tons in steel sheets, 3000 tons in hoops, bands and strip steel, 2000 tons in wire rods, 20,000 tons in structural material, 8000 tons in rails, 7500 tons in rail fastenings, 16,000 tons in boiler tubes, and 2500 tons in wire nails.

IMPORT DECLINE LARGELY IN PIG IRON

Meantime imports have shown a 34 per cent shrinkage—from 1,034,583 tons in 11 months of 1926 to 686,279 tons a year later. Nearly all of this falling off is accounted for by pig iron and scrap; together they showed a drop of 336,000 tons. Pig iron was 42 per cent of the 1926 total, and only 17 per cent in 1927.

Increases in imports of rolled products were considerable in 1927, though there was a decline of 46,000 tons in rails. Some of the increases were: 7700 tons of wire rods, 37,000 tons of structural shapes, 5400 tons of sheets, 6000 tons of hoops, bands and cotton ties, and 22,600 tons of wrought pipe. There was a decline in steel bars to the extent of 14,000 tons. Ingots, blooms, billets and slabs dropped over 50 per cent, or by more than 17,000 tons.

WHERE THE CHIEF EXPORTS WENT

As has been the case for many years, Canada was the largest buyer of our products last year, taking 38½ per cent of the total against 39 per cent in 1926. Shipments to Canada declined 11,000 tons to 771,197 tons in the first 11 months of 1927. Japan took more from us last year than in the preceding year by about 10 per cent. The total in 11 months went up to 251,153 tons, or 12½ per cent of all our exports. No other country, aside from these two, took as much as 100,000 tons.

Cuba (87,480 tons) was in third position, with Argentina (75,465 tons) and Mexico (75,361 tons) following close together in fourth and fifth. In 1926 Mexico was third and Cuba fourth. Other countries taking upward of 50,000 tons in the first 11 months of last year were Brazil, Colombia, Great Britain and the Philippine Islands. China took a little more than 49,000 tons. Chile and Venezuela were beyond the 50,000-ton mark in 1926 but dropped well below it last year.

Rolled steel accounted for about 83 per cent of our exports last year, as in the year before. In imports rolled material made a heavy advance over preceding years, reaching about 57 per cent of the aggregate, compared with 35 per cent in 1926.

Belgium had a large lead as the source of imports in the first 11 months of the year, with a total of 185,939 tons. France, in second position, sent 125,411 tons, followed closely by Germany, with 121,829 tons. Other countries were far below. Canada sent 68,871 tons; India, 59,108 tons; Great Britain, 50,328 tons; Nether-

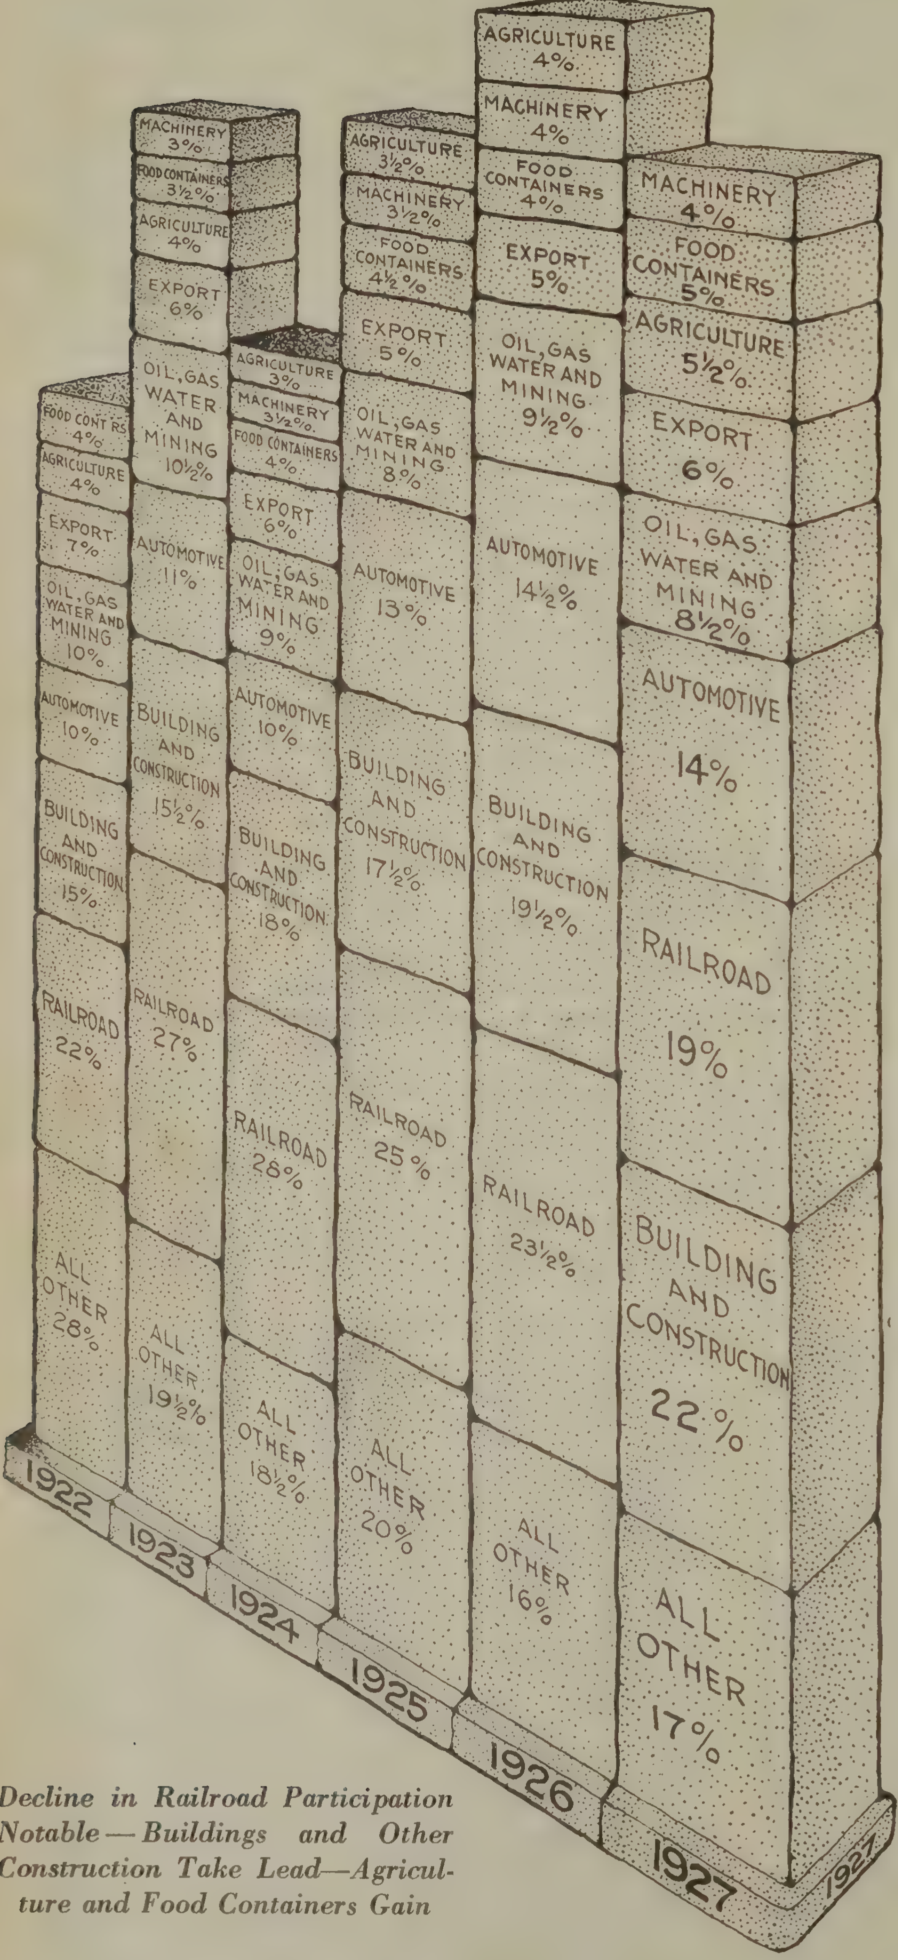
What Steel Was Made and Where



Decline in Railroad Participation Notable — Buildings and Other Construction Take Lead—Agriculture and Food Containers Gain

SUBSTANTIAL gains in production of structural shapes and wire in 1927 were more than offset by losses in other products. As a result the year fell nearly 8 per cent behind 1926 in rolled steel output. Steel bars recorded the most notable drop—over 800,000 tons, or 30 per cent of the total decline of 2,743,000 tons.

Production is estimated at 32,039,000 gross tons, compared with 34,782,000 tons in 1926 and 32,660,000 tons in 1925. The total was above the 31,580,000 tons of 1923, but below the 33,068,000 tons of 1917 and 32,380,000 tons of 1916. No year, aside from those mentioned, has equaled the 1923 figure.

Estimates on production are based on returns from rolled steel makers accounting for 30,554,000 tons, or over 95 per cent of the year's total. This high rate affords further proof of the spirit of cooperation of the industry in providing, in confidence, information of value to the common cause. Less than 5 per cent of the industry had to be estimated. Consequently the dependability of the total figures has been improved over those of years of less abundant returns.

Moreover, a larger proportion than ever before provided detailed classification of distribution of their shipments. This group accounted for 78 per cent (24,991,000 tons), compared with 73.3 per cent last year and 65.5 per cent in 1925. The table in the center of pages 8 and 9 shows a composite of these data, as furnished by 41 companies.

To determine the final place of consumption of the large tonnages shipped by the steel makers to jobbers, careful allocation has had to be made, paying due regard to the class of material and to the customers of the jobbing industry. Because of the necessity to redistribute such large tonnages, ratio figures taken from the table covering 78 per cent of the output would be misleading. The jobbers furnish very little material to the railroads, but sell many thousands of tons to builders. The automobile plants buy practically all their re-

It Went in Nineteen-Twenty-Seven

quirements direct from the mills, but much of the oil, gas, water and mining tonnage passes through warehouses.

Warehouse purchases constituted 12¼ per cent of the total steel sales reported by the 41 companies which showed complete distribution of their product. More than 3,060,000 tons followed this channel on the way into ultimate service, out of 25,000,000 tons reported. Among the items thus passing through the "middleman," pipe, with more than 1,050,000 tons, represented 34 per cent. More than 500,000 tons of wire, and some 300,000 tons each of sheets, bars and shapes, were sold through the jobbing trade.

By taking more steel than ever before—more, even, than in the record-breaking preceding year—buildings and other construction have taken first place in 1927, relegating the railroads to second position. It is estimated that construction absorbed 7,050,000 tons of steel, while the railroads accounted for but 6,125,000 tons. This estimate of the complete distribution places the automotive consumption above 4,500,000 tons.

Estimates of the total production of the various forms of steel in 1927 are given in a table in this column. Bars, including concrete bars, continue to hold the top position, with over 18 per cent of the total. Sheets were in second place, with pipe, shapes and plates, closely grouped, following. In preparing this table allowance had to be made for the final conversion into finished product of such billets, slabs, sheet bars, wire rod and skelp as were sold in those forms by the principal makers.

Estimated Production in 1927

	Gross Tons	Per Cent
Heavy rails	2,559,000	8.0
Light rails	165,000	0.5
Track accessories	979,000	3.0
Plates	3,514,000	11.0
Structural shapes	3,632,000	11.3

Consumption of Important Industries. For example: Of railroad purchases, 41 per cent was rails, 14 per cent plates, 9 per cent bars, etc.

Building Steel Surpassed

COMPARED with 1926, there was a considerable change in the proportions of steel taken by several important industries. Agriculture and the "tin can" interests both advanced from 4 per cent of the total in 1926 to about 5 per cent in 1927. Exports gained, through a slight advance in tonnage shipped, out of a lower aggregate of steel produced. A falling off was registered by the oil and mining group and a smaller drop by the automotive industry. The railroads took much less than in 1926, while the building industry, maintaining its enormous stride of the preceding year, absorbed a considerably larger proportion of a smaller total tonnage. Shipbuilding (not shown separately in the diagram on page 6) took 1¼ per cent of the rolled output.

Because of the decline in railroad purchasing and, to a less extent, of the mineral and the automotive groups, the four largest avenues of consumption showed a falling off in their percentage of total steel used. Instead of 67 per cent, as in 1926, they accounted for only 62½ per cent of the aggregate in 1927. This is the smallest such ratio since 1922, for the "big four" absorbed 63½ per cent of the 1925 total, 65 per cent of that of 1924 and 64 per cent in 1923. Construction activity has shown a healthy and well-nigh steady gain. From 15 per cent of all in 1922 it has advanced to 22 per cent in 1927, with the only setback (from 18 per cent in 1924 to 17½ per cent in 1925) representing actually an increased tonnage, though at a rate of gain less than was registered by other lines.

What Percentage of Each Form of Steel Was Distributed in 1927 Among the Industries

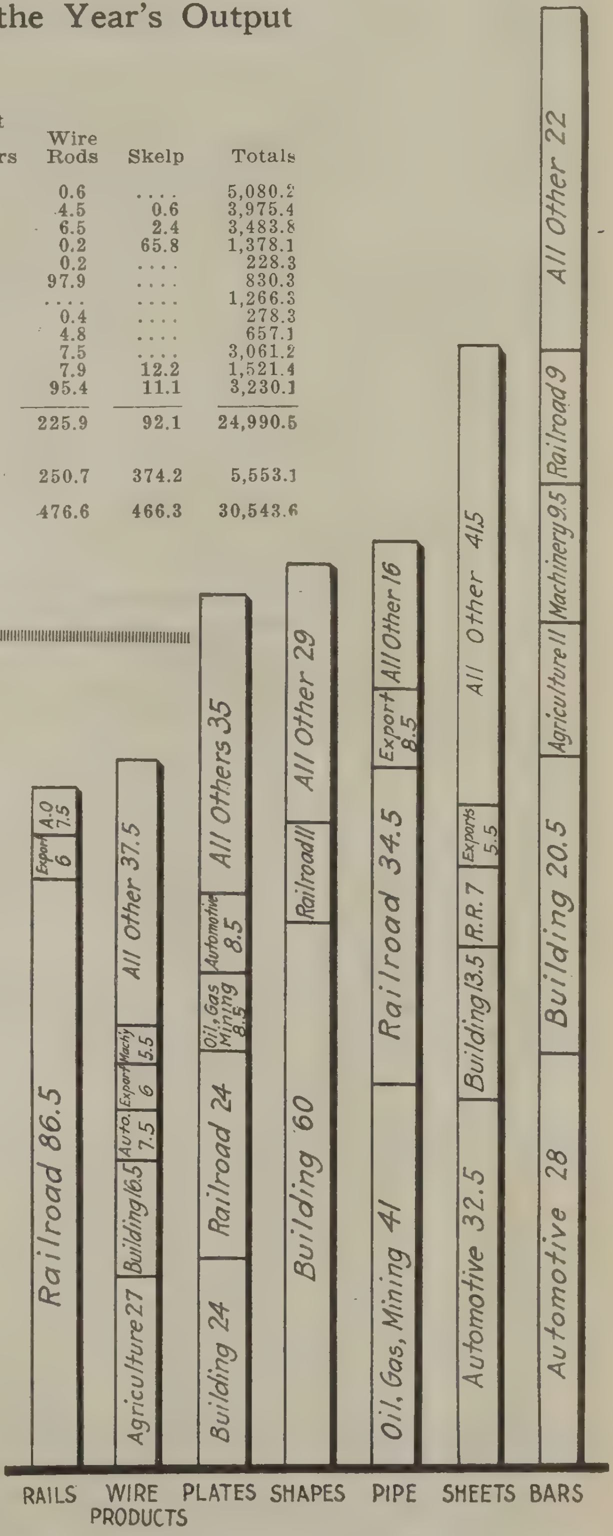
Railroad Tonnage in 1927

Nearly 41 per cent of the steel tonnage bought by the railroads consisted of rails. Almost one-third of the construction tonnage was in structural shapes. Of the automobile purchases, one-third consisted of bars and nearly an equal quantity of sheets. Much more than half of what the oil and mining interests took was pipe. About 43 per cent of the agricultural tonnage was wire and more than three-fifths of the remainder was bars, mainly used in machinery manufacture. Three-fourths of the food container tonnage consisted of tin plate and half the remainder was sheets. Five-sixths of the tonnage going into shipbuilding was of plates, shapes and bars, the former greatly predominating. These facts, and many others, are brought out by the table and the diagram on page 8.

More than six-sevenths of all the rails went to the railroads, as shown by table and diagram on page 9. They took, also, nearly all the track accessories and one-quarter of the plates. Automobiles accounted for half of the hoops and bands and of the strip steel, one-third of the sheets and more than one-quarter of the steel bars. Agriculture absorbed one-quarter of the wire. Construction required three-fifths of the structural shapes, one-third of the pipe and one-quarter of the plates, and was second only to the automobile in the taking of bars. Food containers took three-fifths of the tin plate, while the oil group was the greatest purchaser of pipe, with more than two-fifths of the total. Exports ran unusually heavy on tin plate, more than one-sixth of the output going abroad.



Which Industries the Different Forms of Steel Served in 1927. Of bars, 28 per cent went to automotive plants, 20½ per cent into building, etc.

Some Improvement in Steel Trade Forecast for 1928

Greater Volume and Enhanced Prices Anticipated by Doctor Haney—General Business Betterment Expected to Help

BY DR. LEWIS H. HANEY
DIRECTOR, NEW YORK UNIVERSITY BUREAU OF BUSINESS RESEARCH

ALTHOUGH 1927 was characterized by a generally declining trend in business, it is none the less true that the total volume for the year was not greatly less than in its predecessor. Industrial production was little more than 2 per cent under 1926. Manufacturing production was nearly 3 per cent less, largely because of the sharp decline in automobile production. Wholesale sales were nearly 4 per cent smaller than in 1926 (see Fig. 3). Railroad freight tonnage for the first 11 months was 2.3 per cent smaller than in the same period of the preceding year. These comparisons are indicative of the strong basic conditions in industry and manufacturing.

Some indexes of business actually showed an increase over the preceding year. Bank debits were 11 per cent greater and retail sales were between 2 and 3 per cent larger. Of course, the very large volume of trade in securities, at record breaking levels, is partly responsible for the rise in bank debits.

But, while the total volume for the year was thus by no means small, the trend during the year was downward. Comparing November, 1927, with November, 1926, industrial production and manufacturing fell about 8 per cent, and employment in factories was more than 6 per cent smaller. Freight traffic actually declined about 25 per cent (see Fig. 1). Imports, which are a good measure of industrial activity, were more than 8 per cent smaller (Fig. 6). One of the largest declines during the year occurred in automobile production, which was 53 per cent lower in November, 1927, than a year earlier. Building activity, however, had recovered by November to within 1 per cent of the same month of 1926.

The foregoing statements apply to production and trade in commodities. Speculative transactions in securities and the financial factors show a different trend. The average price of stocks was some 32 per cent higher last November than in the same month of 1926, and brokers' loans showed almost exactly the same increase. The net demand deposits of the member banks of the Federal Reserve System were 8.7 per cent larger and total loans and discounts were up nearly 7 per cent. Some phases of business, too, showed large gains. Thus bank debits, in spite of some decline toward the end of the year, were 15.8 per cent larger. Farm prices showed a notable gain of 7.9 per cent and *Bradstreet's* index of wholesale commodity prices averaged 5.9 per cent higher.

Thus at the end of the year we find the physical volume of industry and trade at a relatively low level—somewhat below normal—while security prices were very high and bank credit much extended in connection with investments in stocks and bonds and loans secured by them.

Improved Basic Business Conditions

SOME real progress toward improvement in business fundamentals was accomplished during 1927. The following impress me as being the most important points:

1. Considerable recovery occurred in farm prices, which gained on prices of non-agricultural commodities, thus correcting one of the serious maladjustments of the preceding year (see Fig. 2). On the whole, the agricultural situation appears to have turned its post-war corner.
2. The cost of living was reduced in 1927, the National Industrial Conference Board's index falling 2.4 per cent. Residential rentals were reduced materially.
3. Certain basic industries which have been depressed during recent years showed recovery. This is notably true of leather and copper. Cotton manufacturing, too, made gains during the year and wool manufacturing worked into a po-

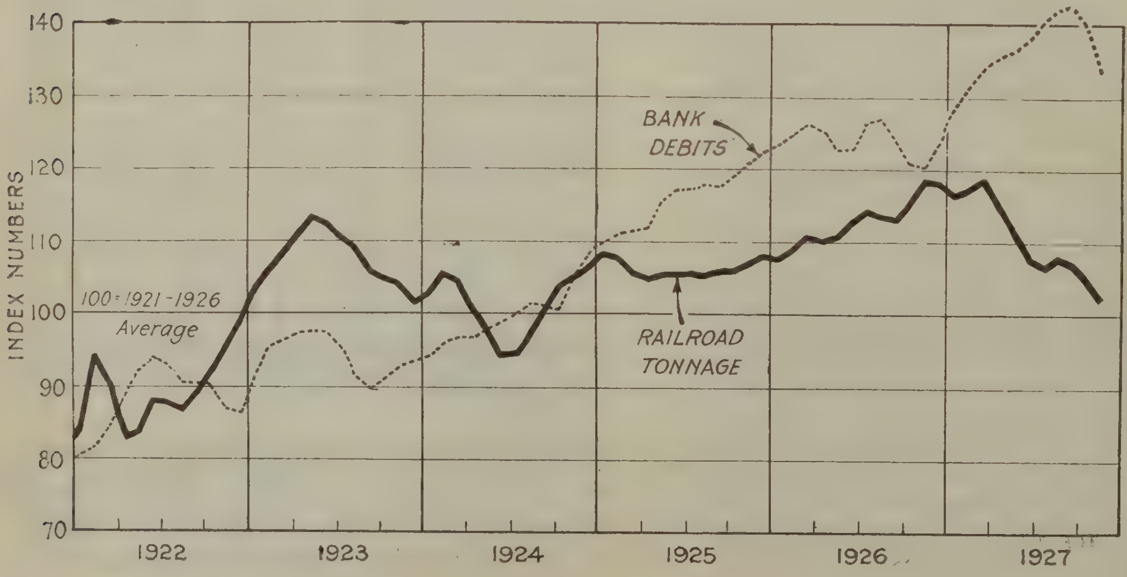


Fig. 1—While Freight Traffic for the First 11 Months Was Only 2.3 Per Cent Lower Than in 1926, November Showed a Decline of 25 Per Cent. Bank debits, on the other hand, made the highest record ever known, averaging 11 per cent above 1926

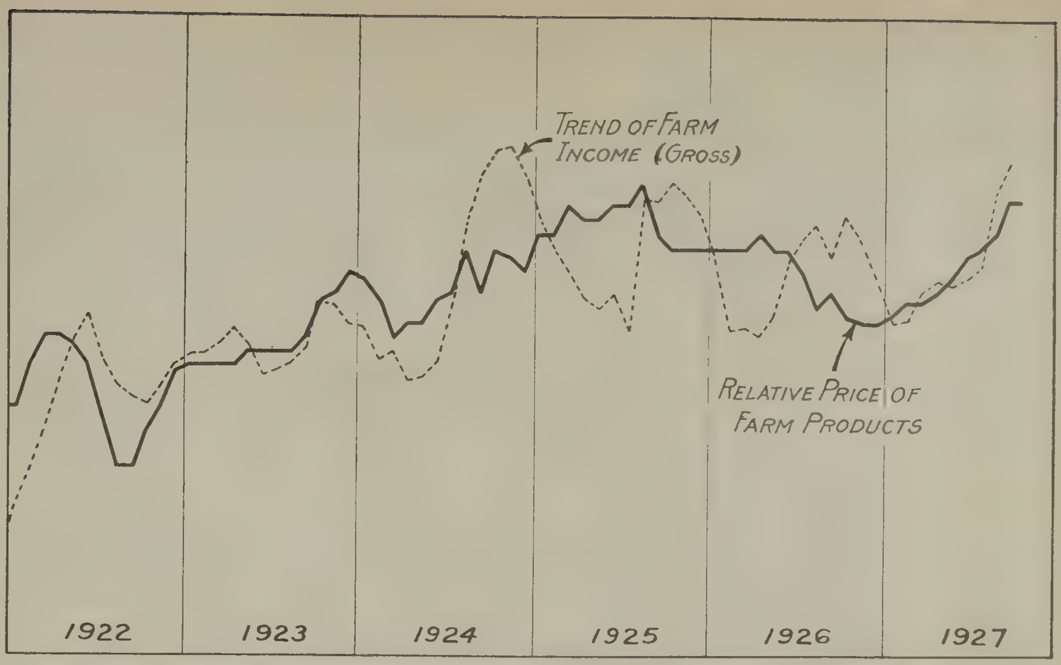

Fig. 2—Farm Purchasing Power May Be Measured by the Relation Between Prices of Farm Products and Prices of What the Farmer Buys. At present the farmer appears to have reached a more comfortable position

sition from which improvement may be expected. Perhaps the outstanding development of this sort, however, was the recovery in the cattle raising industry.

4. Improvement of European financial and industrial conditions (particularly the former) was a notable achievement, the outstanding event being the resumption of a gold basis in Italy. The chief currencies are now stabilized and this will benefit world trade.

5. In connection with the preceding point, there were clear signs of a more effective cooperation among the central banks of the leading countries and the beginning of what it is hoped will be an orderly readjustment of the gold supply of the world. Considerable gold exports occurred toward the end of the year, without indications of causing serious disturbance (see Fig. 6).

6. Within the United States progress toward a readjustment of an over-extended real estate situation appears to have been made without a crisis.

7. Industry has adjusted itself more completely to the so-called hand-to-mouth buying regime, the progress made in operating with smaller inventories being notable.

8. Progress has been made toward more effective cooperation in a number of industries, such as textiles, copper and sugar. The formation of trade organizations designed to use statistical information more effectively and to eliminate unfair competitive practices may, if not abused, mark a real advance.

Further Adjustments Needed

SOME of the maladjustments which were noted a year ago were corrected in 1927. At that time I called attention to over-production of copper, cotton textiles, oil, lard, automobiles, building, pig iron and corn. Probably it may be said that in each of these cases there is now no over-production, although some further correction may be required in cotton textiles and pig iron.

On the other hand, some of the former maladjustments still exist. Stocks of manufactured goods in producers' hands again appear to be too large for comfort, and certainly prevent the conclusion that any shortages exist. (It may be noted, however, that this is, in part at least, a natural consequence of the practice of hand-to-mouth buying.) Bank credit is even more extended than at the beginning of the year, and it is noteworthy that the large increase in bank credit has been due almost entirely to loans and investments connected with the security markets. This, in my opinion, constitutes the chief maladjustment.

Money rates still appear out of adjustment with the commodity price level, although the situation is now reversed in comparison with that which existed a year ago. At that time money rates were relatively high, now they are relatively low, and appear to be so partly

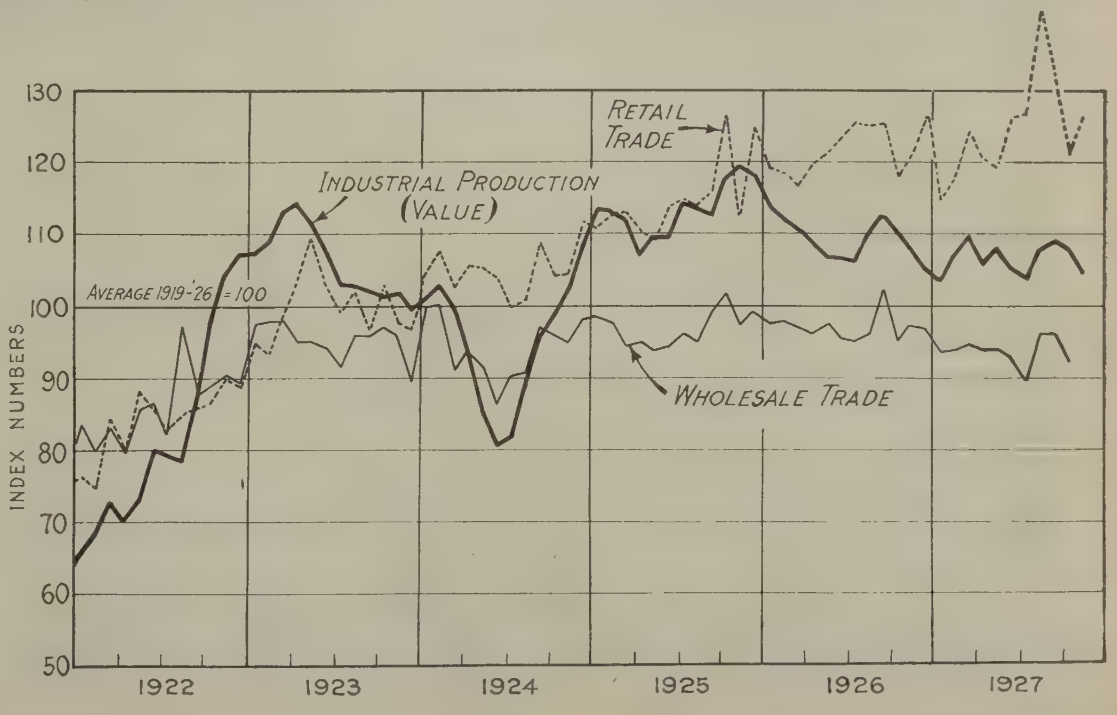

Fig. 3—Wholesale Trade in 1927 Was 4 Per Cent Below 1926, But Retail Sales Are Estimated at 2½ Per Cent Above the Previous Year. Industrial production showed a decline of little more than 2 per cent

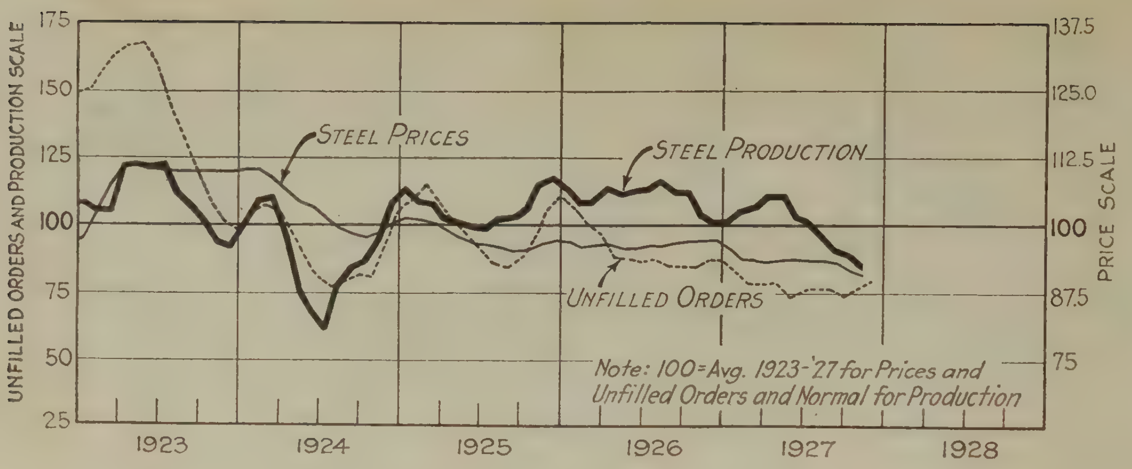

Fig. 4—Finished Steel Was Less Steady in Price in 1927, *Dropping From a Virtually Uniform* 12-*Month Level to* 5 *Per Cent Lower. Production fell off perhaps* 8 *per cent. Unfilled orders were lower, but their decline of* 18 *months has been succeeded by a rising movement*

on account of a banking policy which may well be called "artificial." It seems, too, that imports are relatively large when compared with exports (Fig. 6).

Since August, at least, the recession in business has been so clear that no one could fail to see it. The adjusted index of bank debits in that month, as shown in the first chart, was 143 per cent of the average for 1921-1926, but fell to 133 per cent in November. Railroad freight tonnage was 109 per cent and fell to 102 per cent. Here, however, the similarity between the two ceases. Railroad traffic has declined since November, 1926, while bank debits rose steadily and sharply until last August. Freight traffic is the lowest since September, 1924, while bank debits are still higher than at any time in 1926.

This is one of the most pronounced divergences on record. It goes hand in hand with the outstanding characteristic of 1927: The difference in trend between "industry" and "finance"—the one receding, the other expanding. The rise in bank debits reflects the inflation which has affected speculation and retail buying, and the relative over-extension of bank credit in these directions, while the decline in freight traffic reflects the contraction of industrial output.

This condition represents a maladjustment, but it does not seem to be necessarily serious. For one thing, it is partly due to a lower basic level of interest rates, based on the large supply and lower unit productivity of invested capital. The trend of yield on bonds (which fairly represents the basis for capitalizing a reasonably certain income) has been rather steadily downward. This has justified higher prices for equities in the invested capital which yields such income. Thus abundant funds and a lower basis for capitalization have brought higher capital values in spite of the reduced volume of business and earnings.

Of course, such trends cannot go on forever. The outward movement of gold and heavy investments abroad are tending to check the declining trend of interest rates and thus to terminate the advance in capital values. But, just as stocks and bonds went up in 1926 and 1927 while business receded, so business may expand in 1928 in spite of some recession in stocks and bonds. Moreover, before long, any increase in net earnings in business will tend to offset a decline in the basis for capitalizing such earnings.

Business Likely to Gain on Finance

WHAT seems likely, therefore, is a readjustment in the relation between business and finance which will temporarily check both the decline in the interest rate and the rise in security values sufficiently to bring them into line with business earnings. Earnings have fallen so low that a very low basis of capitalization is required to justify present security values. Therefore, what is needed for a time is higher earnings. Temporarily this will probably cause a higher interest rate and lower security values. In a few months, however, higher earnings and a cessation of rising interest rates are likely again to bring higher security values.

It is doubtful if so far-reaching a readjustment can be completed in a year. Nineteen hundred and twenty-eight will probably see the initial phase of a development which will extend over a period of years and be attended by a series of readjustments, in which gold exports, foreign competition, manipulation of money rates by the Federal Reserve Board and corresponding fluctuations in security values will be the outstanding features.

Steel Sales Unusually Stable

AS to the iron and steel industry, the year was one of rather steady and sharp recession. As the fourth chart shows, the decline began in June and the output of steel ingots in November, allowing for seasonal conditions, was the lowest since September, 1924.

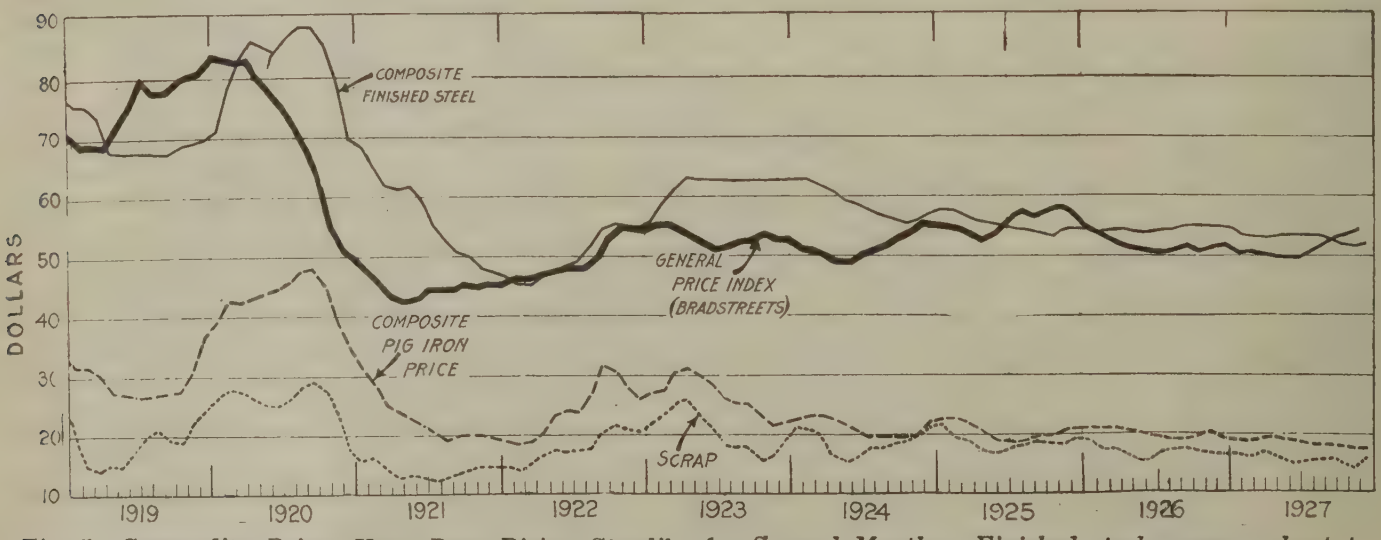

Fig. 5—Commodity Prices Have Been Rising Steadily for Several Months. Finished steel appears about to follow, but pig iron still clings to its lowest level since 1916. *Scrap has been below all records since* 1921 *but now is going upward*

Summary of Year's Developments as Outlined by Doctor Haney

1. The year 1927 was one of declining volume of industry and business profits. It lay in the course of a downward swing of a business cycle.

2. At the end of the year the recession in business, notably in steel production, had gone so far that the end of the decline appeared to be near. The absence of credit stringency, recovery in commodity prices, and improved farm purchasing power, all strengthened this conclusion.

3. The year is notable for the divergence between "business" and "financial" indexes, a rather steady expansion in bank credit and security market operations going on while industry receded. Toward the end of the year, the gradual tightening in the position of bank credit (large gold exports and high brokers' loans), and the high level of prices for many stocks and bonds, indicated the probability of higher money rates to come and a readjustment in the security markets.

4. As the new year opens, the outlook is more favorable than that which confronted 1927, for a business recession is in the last stages and is not beginning, as was the case a year ago. A recovery in the volume of industry and in business profits is probable during the first half of the year. The tightening of money markets that is to be expected may be sufficient to check the expansion in business later on; but so far as can now be seen a rising trend, followed by irregular stability, is probable. Sustained construction activity, increased automobile production, and a moderate gain in railroad buying promise increased steel business during the first half year. Stronger markets for iron and steel are probable by February.

It was 15 per cent below normal. The year began and ended with steel production lower than in 1926, and the peak reached in May was considerably under the high point reached in July and August, 1926. Much of the same situation existed in pig iron production, there being a rather sharp recession from April on. The decline in October and November was not so great as in the case of the steel output and, accordingly, the year ends with pig iron production relatively high as judged by steel-making requirements. The ratio of the average daily production of pig iron to the average daily production of steel was abnormally high most of the year. At the end, pig iron production was only 6 per cent under normal.

Unfilled orders of the Steel Corporation reached bottom in May, after a long decline which began in December, 1925. The unfilled orders have been unusually stable at a low level, but the trend was gradually upward toward the close of the year.

Sales of some of the chief items of finished steel during the first 11 months of 1927 amounted to 6,591,000 tons, which compares with 6,619,000 tons in the preceding year, and is practically the same as the volume recorded in the first 11 months of 1925. Steel sales have been unusually stable throughout the year and in November increased to a point considerably above a year ago. This is chiefly due to the recovery in building activity and in agricultural buying of farm machinery and implements.

On the whole, the activity in the steel consuming

(*Concluded on page* 109)

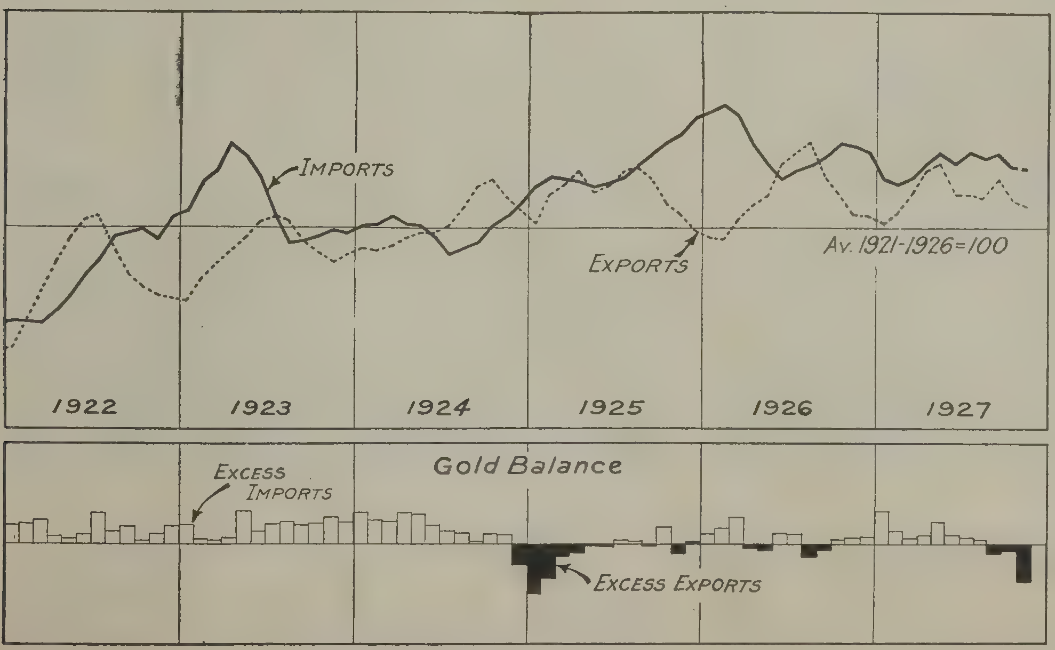

Fig. 6—Imports, Which Are Regarded as a Good Index of Industrial Activity, Were 8 Per Cent Lower in 1927 Than in 1926, But Remained Large Relative to Exports. Gold now is flowing outward in heavy volume

Aircraft of Increasing Importance to Metal Industries

To Aviation's Demands Will Be Added Those Due to Changes Air Travel Will Cause in Modes of Land Travel

BY HORACE C. KNERR*

AIRCRAFT manufacture is giving the world a new branch of the metal-working industry, already of respectable proportions and growing with increasing speed. Last year the Department of Commerce listed more than 90 manufacturers, as many distributers of aircraft, and several hundred firms interested in accessories and associated products. It is probably conservative to say that the activity of the firms listed has doubled in 1927. and that many new firms have entered the industry. Flying fields by hundreds are being established in cities and towns throughout the country. Chicago alone claims a dozen or more.

While much of this growth may be of the mushroom variety, resulting from popular enthusiasm, and therefore short lived, the importance of air transportation is such that a large and steadily growing industry is assured. The transportation of air-mail by private firms under contract to the Government today covers more than 8000 miles of scheduled routes with over 4000 miles lighted for night flying. The Army and Navy are placing large orders with private manufacturers, and the use of airplanes for private flying, both for business and pleasure, has reached astonishing figures. One manufacturer alone is scheduling a production of 100 planes per month for such use; another small town in the Middle West has five busy aircraft factories; there are some sixty odd industries in the Detroit territory engaged in aircraft construction, operation or associated activities. Such instances could be extended to a long list.

Dirigibles, although not at present greatly in the public eye, have clearly demonstrated their commercial application and are certain to take an important industrial place before many years.

Materials Developed for Aircraft Prove of Great Utility to Other Industries

The influence of aircraft on metal industries may be classified as direct, semi-direct, and indirect. Under the first heading comes the construction of planes, dirigibles, engines and accessories—that is, those things which actually fly.

Here the requirements are of the utmost severity. Design, materials and workmanship must be of the highest type. Success depends upon carrying the maximum useful load, and also upon safety, reliability and endurance. The best is ultimately the most economical.

Special grades of steel, alloys of iron and the light metals, have already been developed for the structural parts, and such development must continue. These in turn will be utilized by many branches of the metal-working industry not connected with aircraft. A special analysis of chrome-molybdenum steel of mild carbon content (known as S.A.E. 4130X) has been developed for the construction of fuselages and other structural members of airplanes, largely because of its excellent welding qualities, combined with satisfactory fabricating characteristics and exceptional strength and toughness after welding. The physical properties are subject to still further improvement by normalizing or other simple heat treatment. The original requirements for this metal were only for seamless steel tube, which is now being produced in large quantities. The necessity for joining fittings made of sheet steel to tubular members has recently created a demand for thin sheets of the same analysis, and also for bar stock.

Stainless iron and other corrosion resistant ferrous alloys have an important field of usefulness in seaplane construction.

Duralumin was developed principally for the construction of Zeppelins. As a result of a study of the metallurgy of this remarkable alloy, other wrought aluminum alloys differing in certain characteristics many other industrial fields.

Aluminum foundry alloys of high strength, such as have been placed on the market, and all are growing in applications, not only in aircraft construction but in the Lynite series, were evolved for use in aircraft construction and now find wide and highly valuable application in many industrial uses, with a far reaching influence on foundry practice because of the close technical control required, and the introduction of heat treatment. Aluminum base die castings also find an increasing outlet in instrument parts for aircraft.

These are only a few outstanding examples.

It was mentioned above that the metal industries are influenced by aircraft construction semi-directly. An instance of such effects is that on the welding industry. A few years ago the practice of building fu-

Hangar at Lakehurst, N. J.

By comparison with the size of touring cars on the floor, an idea can be gained of the great amount of structural steel needed for hangars and of light alloys for dirigible skeletons. This view was taken of the Shenandoah when under construction in 1923.

The head-piece of the article shows a modern mail-carrying plane, built by Pitcairn Aviation, Inc., Philadelphia. Fuselage, struts and landing gear of alloy steel seamless tubes; Wright engine, steel propeller.

selages by the acetylene welding of seamless steel tube was introduced from abroad. This has now become general practice in America and has not only opened a new market for welding equipment, but has developed new technique and established new standards of excellence for welded structures by which industry at large is benefiting. Welding of aluminum and its alloys has also been greatly advanced through the medium of aircraft construction, one of the earliest developments being in the construction of fuel tanks of sheet aluminum.

Methods of corrosion prevention, such as electroplating with zinc and cadmium, and various protective coatings such as paints, varnishes and cellulose derivatives, find an exacting but wide field in aircraft work and the improved materials have been quickly extended to other fields.

The rigorous technical control of materials and processes demanded in aircraft construction has increased the demand for testing equipment and for pyrometers, heat treating furnaces, and other metal treating apparatus.

To all of this, obviously, is added the full line of metal-working tools and shop accessories required in the fabrication of aircraft, together with the factory buildings themselves—all of which has stimulated various metal industries in devious ways.

Aircraft of all kinds must have hangars for shelter, and adequately equipped bases, landing fields and routes for operation. This introduces a new outlet for metal of ordinary commercial grades. Airplane hangars are principally steel sheds. Landing field accessories such as fuel storage, lighting facilities at the field and along thousands of miles of routes, and repair shops call for a diversity of metal products. Hangars and mooring masts for dirigibles also entail notable tonnages of structural steel.

Trans-oceanic service both of planes and dirigibles is another matter of the near future. This, as Colonel Lindbergh and others have pointed out, will probably call for floating landing stages at intervals of a few hundred miles. These must be elaborately equipped both for the care of aircraft and the accommodation of passengers. They will probably take the form of huge floating docks or platforms and, according to plans which have been proposed, will require a metal construction dwarfing the largest ocean liners.

Twenty years ago the automobile enthusiast could hardly forecast the tremendous industry which it involves today. Neither could he predict the good roads movement which now requires not only the services of the best part of the construction industry, but which has widened the sphere and outlook of both the country man and the city dweller. One may now be pardoned for speculating upon the ultimate influence of travel by air upon human habits and thought.

Anyone, after having learned to travel in the air by the most direct route, in straight lines, at speeds from 100 to 200 miles an hour, will no longer be content to progress by the devious and halting transportation now offered by railroad train and automobile. Yet these agencies possess the indisputable advantage, from an engineering standpoint, of connection with terra firma. This is not primarily a matter of safety; properly organized airways have already demonstrated that travel by air may be made practically as safe and reliable as ground transportation. Ground vehicles do not depend upon the expenditure of power or the use of cumbersome and delicate gas containers to support them in a position of usefulness. The automobile is better adapted to everyday use by the average citizen than the airplane and requires less terminal facilities, while the railroad train has the advantage of great carrying capacity in large units. Inherently, ground methods of transportation are capable of greater speeds than aircraft, with less consumption of power per unit of useful load, and with less risk.

To realize these advantages of land travel it will be necessary for future engineers to provide straight and unobstructed lines of travel, and to reduce friction and inertia to a minimum. These things can and doubtless will be done, largely as a result of the methods and materials of construction, the ways of thinking and the commercial demands arising from the habit of travel by air. Highways, instead of following the tortuous contour of the earth, will be constructed on steel ways on level and straight lines, and probably will be inclosed as a protection against weather. Cars and trains will be of light metals or high strength alloy steels to minimize bearing friction and inertia, and construction will have streamline form to minimize air resistance. The consequent enormous demand on the metal industries, both for vehicles and for ways, is obvious.

Trends of Iron and Steel Consumption

More Than 1,000,000 Tons Annual Gain Indicated by a Group of Leading Items

STUDIED over a series of years, returns of production of various items of iron and steel entering into industry show clearly defined tendencies. In most such cases there is an increasing use of the material, in some at a much more rapid rate than the gains in other products. A few of the outstanding cases were covered in two-color diagrams in THE IRON AGE of Jan. 6, 1927. Brought up to date, the leading items indicate an increasing use of iron and steel at a rate exceeding 1,000,000 tons a year.

Many of the items included in the trend studies are not reported in tonnage. Among them are buildings (floor area), foundry equipment, steel furniture and steam pumps (dollars), mechanical stokers (horsepower), and electrical energy (kilowatt-hours). For others, reported by numbers, a tonnage figure may be estimated. This group includes locomotives (figured at 100 tons of iron and steel), freight cars (13 tons), passenger automobiles (1¼ tons), motor trucks, buses, etc. (2½ tons), enameled bathtubs (150 lb.) and steel barrels (65 lb.)

Based on the above, the annual changes in tonnage and other demands shown by the several trend lines may be estimated as follows:

	Increase Gross Tons	Decrease Gross Tons
Passenger automobiles	320,000	.....
Motor trucks	90,000	.....
Concrete bars	31,000	.....
Fabricated structural steel	82,000	.....
Wire and wire products	26,000	.....
Locomotives	.....	12,500
Freight cars	.....	11,000
Commercial steel castings:		
Railroad	2,200	.....
Miscellaneous	9,300	.....
Steel sheets	343,000	.....
Structural shapes	75,000	.....
Enameled bathtubs	12,500	.....
Steel barrels	24,000	.....
Gray iron (Ohio foundries)	23,000	.....
Iron and steel	1,038,000	23,500
Copper	11,000	.....
Tin	2,200	.....
Zinc	6,800	.....
Non-ferrous metals	20,000	.....
By-product coke	2,312,000	.....
Bituminous coal	4,823,000	.....
	Square Feet	Square Feet
Building contracts	5,424,000	.....
Industrial buildings	.....	7,070,000
	Dollars	
Foundry equipment	636,000	.....
Steam pumps	172,000	.....
Steel furniture	2,105,000	.....
		Horsepower
Mechanical stokers	.....	11,000
	Thousand Kwhr.	
Electrical energy	4,725,000	.....

Aircraft Manufacturing Increases

Civil Flying Activities Grow Tremendously in Year and Output of Planes and Engines Will Greatly Exceed 1926 Total of $24,000,000—Airways 8441 Miles

BY CLARENCE M. YOUNG*

THE new year in aviation is one of bright prospect for the United States and, indeed, for the whole world. This is especially true in regard to commercial aviation, in which vast strides have been made during the year just ended.

Through the use of the air mail entire business days have been saved in communication between the east and west coasts and also between sections connected by feeder lines joining the transcontinental route. Banking houses and jewelry stores and other organizations particularly interested in saving time in transport of valuable goods have come to rely on this new and rapid service. The cost of operation has been reduced through the building up of a great airway system in the United States so that the rate to the user is extremely reasonable.

Airplane Industry Cannot Meet Demand

So extensive have been the developments that the aircraft manufacturing industry cannot keep up with the demand for its products. Exact figures for 1927 are not yet available, but in 1926 there were 1186 planes produced. Approximate figures for 1927 indicate that at least 1525 planes have been built and that there are 1239 unfilled orders. Census statistics for 1926 show a total value of $24,161,752 for production of aircraft and engines. This was an increase of 60.3 per cent over 1925. The figures for 1927 will be much greater, and it is impossible to estimate how far those of 1928 will exceed the record of the past year.

Classification of Aircraft Manufacturers

The manufacture of aircraft and engines is only a part of this new and growing industry. The Aeronautical Trade Directory issued by the Department of Commerce indicates the ramifications of this new business. Among other details are listed the number of manufacturers of various products:

Airplanes	90
Seaplanes and flying boats	10
Aerial cameras	2
Chemicals and similar products	9
Aeronautical clothing	12
Aircraft engines	43
Engine rebuilding	8
Fabric	10
Aircraft furniture	1
Electric generators for beacon lights	5
Glue and cement	13
Goggles	4
Canvas hangars	3
Metal hangars	25
Aeronautical instruments	19
Lighter-than-air ships	5
Lighting equipment	23
Metals for aircraft	10
Ignition equipment	20
Aircraft metal wire	6
Mooring masts	1
Parachutes	3
Paints and varnishes	9
Airplane radiators	8
Airplane sirens	1
Spare parts	57
Tie rods and fittings	4
Skeleton beacon towers	10
Aircraft wheels	6
Wind indicators	3

The directory also shows 81 airplane distributers, 30 airplane dealers, and eight airport designers and constructors.

The skeleton beacon towers mentioned in the preceding list are used on airports and along the civil airways. These towers are 50 ft. high and are constructed of light galvanized structural steel. Powerful beacons are mounted on platforms at the tops of these towers to indicate the airways and assist pilots in locating airports. These beacons are usually located about 10 miles apart along the airways. A beacon is also installed at each intermediate landing field, such as are maintained by the Department of Commerce at intervals of about 30 miles.

United States Airways Total 8441 Miles

On July 1, 1927, the Post Office Department transferred its transcontinental airway, crossing the continent from New York to San Francisco, to the Department of Commerce. This included all of the equipment at the 124 intermediate fields between the two coasts. With certain contract air mail routes there were at that time 4121 miles of lighted airways. Over 1500 miles were added to this figure during the latter part of 1927. The Department of Commerce is planning lighting on still more routes and is establishing unlighted intermediate fields to facilitate operation on daytime routes.

The total length of airways in the United States is 8441 miles. The daily mileage flown over these airways is 18,926. In the calendar year 1927 there was an increase of about 23 per cent in total mileage flown over the civil airways of the United States, compared with the preceding year.

It is expected that by spring there will be over 12,000 miles of airways in operation, and that over 26,000 miles will be flown each day over these lines.

The planes operating on these routes are in most cases modern types, some of which are inclosed cabin planes capable of carrying several passengers in addition to mail, express, and freight.

The American Railway Express Co. has carried on express service since Sept. 1, in conjunction with the Colonial Air Transport, National Air Transport, Western Air Express, and the Boeing Air Transport companies, enabling manufacturers to send packages at a lower rate than could formerly be done by air mail.

Country Now Has 1016 Landing Fields

Airport development throughout the entire United States has been remarkable. This is particularly important, as no method of transportation can expand without sufficient terminal facilities and service stations. There are now 1016 municipal, commercial, Department of Commerce, Army and Navy, and marked auxiliary landing fields. There are thousands of emergency fields throughout the country on which landings have been made but which are not always maintained for such services. At least 328 cities have indicated intentions of constructing municipal airports, or commercial airports which will be available for municipal operations.

Statistics of scheduled air transportation show only a small part of the activity in the industry today. Miscellaneous flying, including "taxi" service, aerial photography, crop dusting, surveying, mapping, and many other services form the greater amount of flying in America, although it is difficult to estimate this because of the lack of reports from these many operators.

Considering all of this gratifying development in air commerce and the great opportunities now open in all phases of the industry, there is no reason why civil aviation in the United States should not soon take its rightful place as a leader in this science which was begun by our own pioneers.

Power Farming Demands New Materials

Metallurgical Development Closely Following Automobile—Greater Stresses Met With Better Steels, Carefully Heat Treated

BY HYMAN BORNSTEIN*

THE principal development in farming during the past few years has been the rapid growth of the use of tractors, and with that has come the development of implements to be used for power farming. The extensive use of the tractor has necessitated the development of entirely new implements as well as modifications in old ones. These developments mean changes in design as well as in materials and treatment.

First, there has been a modification in the tractor itself. The tractor of a few years ago was more in line, in reference to design and materials, with the farm implements of that time. The tractor was heavy and low-grade materials were used. During the past few years, tractor development has closely followed that of the automobile, so that power has been increased while weight has been decreased. The design has been notably improved and along with that has come the use of higher grade materials.

Evolution of the Tractor Plow

One of the first implements to be designed for use with the tractor was the tractor plow. Two elements were required: A minimum of weight, consistent with performance, and a maximum of strength. This meant the employment of better materials. One of the first points of weakness was the plow frame. It was found necessary to subject these parts to heat treatment to obtain the maximum in physical properties and to specify a definite range of analysis for materials. Another one of the developments with the tractor plow was the substitution of rivets for bolts. This was to maintain a more rigid frame to meet the greater stresses encountered in power farming.

Up to about ten years ago, the steels bought for the production of farm implements were purchased on a very loose specification. The big bulk of material used was Bessemer steel and re-rolled old rail steel. The Bessemer steel was divided into two grades, soft Bessemer and hard Bessemer. A comparatively small amount of open-hearth steel was used and this was also divided into two grades, soft open-hearth and hard open-hearth. The designer of farm implements at that time concerned himself very little with the details of materials specifications. Quite frequently he might specify soft Bessemer or old rail for the material on a particular job, although the physical properties of these two materials would be considerably different.

Heat Treatment and Closer Specifications

With the development of power farming, greater stresses were set up and it was desirable to keep the weights of the implements down. As a result, detailed specifications have been worked out for the materials used in the various parts of farm implements. Along with this has come a very rapid increase in heat treatment of steel parts. With the increased use of heat treatment has come the substitution of open-hearth steel for Bessemer steel. At the present time, comparatively little Bessemer steel is being used in the farm implement industry and practically no Bessemer steel is used where heat treatment is specified.

The heat treatment carried on by farm implement manufacturers of today is considerably different from the heat treatment of ten years ago. The crude furnaces of that period have been replaced with furnaces which compare favorably with the equipment now used by the automobile industry. Automatic temperature control is the usual thing now on the heat treatment of farm implement parts, where it was practically unknown a few years ago. The pyrometer is being used to determine temperatures accurately, instead of the guess work as to temperature formerly used. Inspection methods have been improved. Hardness limits have been placed on various parts subject to heat treatment and a careful check is made to see that these specifications are maintained.

A more careful check is made of incoming materials. The testing laboratory has become an integral part of production. As a general rule, the materials are subjected to chemical analysis and then are released to the shop for production. Physical tests have been of considerable value in the improvement of design.

Why a Different Plowshare Was Needed

The development of a particular plowshare will illustrate the change brought out by power farming. This particular plowshare had been used for a number of years with considerable success, and the results in the field were satisfactory. Gradually complaints started to come in from the field in reference to breakage of this share. These complaints increased from time to time. The matter became serious enough to merit a close investigation. It was found that the use of the tractor has set up heavier stresses than this share was originally designed for and it was necessary to modify this plowshare in order to make it stand up under present conditions. In this case, it was necessary to change the design and also make a change in the material in order to secure the desired results.

For many years, the disks used for disk harrows and disk plows were made from a high-carbon steel not heat treated. Again the use of the tractor forced the development of a better disk. At the present time, practically all of these disks are being heat treated and the farmer is obtaining a much better product with

---

*Director testing and research laboratories, Deere & Co., Moline, Ill.

One of the Modern Power Farming Implements Which Are Augmenting Capacity for Tilling the Soil

practically no increase in cost. In some cases, alloy steels have been used to obtain the desired physical properties. Riveting and welding are being used largely instead of bolts. Material improvement in physical properties of bolts has come about through use of higher carbon steels and through heat treatment.

By applying the lessons learned in automobile manufacture, the farm implement manufacturer is working to closer limits. The lubrication methods are considerably superior. Grease gun lubrication has become quite common. In the manufacture of disk plows, high-grade anti-friction bearings have replaced the old cast iron bearings. In the manufacture of wheels, electric welding has replaced hammer welding for tires.

More Use for High-Test Cast Iron

There has been considerable improvement in the quality of cast iron used for farm implements. Only a few years ago, high-test cast iron or "semi-steel" was little known in the farm implement industry. Today steel is used to a very considerable extent in the cupola charge and there has been a considerable increase in the strength of the iron. There is a strong tendency at present to replace castings wherever possible with forgings and pressed steel parts.

During the past ten years there has been considerable improvement in farm implements. The lessons learned in automobile manufacture have been and are being applied in the manufacture of agricultural implements. Mass production, progressive assembly, and closer limits have been borrowed from the automobile industry. More rigid specifications on materials are being used and higher grade materials are being employed. Furthermore, the use of heat treatment has increased and the quality of the heat treatment has been improved.

Business Conditions Stable—Hoover

Improvement in Farm Prices, Increased Foreign Trade, Recovery from Partial Unemployment and Sustained Volume of Building Are Reassuring Factors

"A STATEMENT of prospects requires a short catalog of the economic forces which dominate the business situation at our entry into the new year," said Herbert Hoover, Secretary of Commerce, in reviewing the outlook for 1928.

"There is an ample supply of credits at low rates; the somewhat larger stock of goods which were accumulated during the summer are being reduced; there is no consequential speculation in commodities; the crops have been abundant; wages are at a high level; we are recovering from some partial unemployment, especially in the automobile industry. There is peace in most sections of the labor world except bituminous coal; there is more peace in the international world than at any time since the war; the foreign world is recovering its economic strength and buying power, and therefore our foreign trade is steadily increasing. The phenomena usually accredited as premonitory of a slump are therefore absent.

"During the past year there have been important shifts in our own economic world which have an important bearing upon the future. While the average wholesale price of all commodities at about 50 per cent above pre-war is today the same as a year ago, yet if we divide them into agricultural and non-agricultural goods, it will be found that the average price of non-agricultural products has fallen in the 12 months from about 60 per cent above pre-war to 51 per cent pre-war; while the average of agricultural products at central markets has risen from about 35 per cent above pre-war to about 53 per cent above pre-war. However, prices on the farm show only a rise of about 30 to 39 per cent above pre-war.

"Manufacture and distribution have by savings and diminished profits accommodated themselves to this situation of decreasing prices without reduction in the average level of wages and therefore in the national buying power. But the great extent to which industry has accommodated itself to lower prices by decreased costs makes for a sounder condition for the ensuing year. Despite decreasing prices, production and consumption of manufactured commodities have been maintained upon a high level, as shown by car loadings of this class of goods, which have been about equal to those of last year.

"As to particular industries, agriculture, textiles, bituminous coal and some metals still lag behind the others. The contracts let for future execution in the construction industries are at as high a level as at this time a year ago.

"Taken in a broad sense, we enter the new year with the forces of stability dominant in the business world."

What Outlook for the Average Manufacturer?

Small and Medium-Sized Plants Hold Their Ground in Various Fields Through Efficient Management and Market Study

"THE eye of the owner maketh a fat horse." This homely epigram of the late Andrew Carnegie, epitomizing the greatest advantage of owner-management of an enterprise, reflected his skepticism concerning the economic soundness of large industrial corporations, where management is hired and ownership is widely dispersed and bereft of contact with the rank and file of employees.

Since his time, however, the trend toward larger corporate units, particularly in fields adapted to mass production, has continued. Yet it is frequently overlooked that in the fabrication of articles from iron and steel, small and medium-sized plants still greatly outnumber mass production shops. In fact, the smaller manufacturers make up the warp and woof of industrial life, and it is by no means established that as a class they face extinction or absorption into large units.

Smaller manufacturers retain an advantage over their larger competitors in the "intangibles," one of the most important of which has been cited. Their opportunities for efficiency in certain fields are as great, if not greater than those of large corporate organizations. The main motif of mass production, the reduction of costs through increases in output, is also its greatest weakness, since it is dependent upon a proportionate expansion of consumption.

A more secure policy, and one that is being followed by many manufacturers, is to place the emphasis on cost reduction per unit of labor and capital without striving for material increases in total output. An analysis touching on this and other factors affecting the economic position of the smaller manufacturer, and practical suggestions as to how he can meet current problems are outlined in the following symposium of articles.

The Future of the Smaller Manufacturer

BY VIRGIL JORDAN

DURING most of the past 25 years Americans have been suffering from a chronic megalomania, especially in economic matters. They have become more and more enamored of bigness and impressed by mere size in everything, from moving picture houses and football stadiums to manufacturing enterprises, and they have been happiest when dealing with figures from which several sets of zeros have, as a matter of course, been omitted. Both our glorification of large-scale business and industry, and the attacks upon them by over-anxious liberals and radicals, have bred in the public mind generally the idea that enterprises of enormous size are characteristic of American industry and trade and also that the rapid trend toward constantly larger enterprises is natural and inevitable and likely to go on without limit.

This axiomatic idea, however, is questionable on several grounds. In the first place, American industrial development is, practically speaking, a matter of only 50 years, and such a period is too short to warrant any conclusions as to what is characteristic, typical or inevitable for the future. Secondly, there is good reason to regard the rapid increase in size of industrial establishments and business enterprises as the product of the early period of our economic development, accompanying the building up of a new country, the rapid and extensive expansion of transportation and the first stages of application of new forms of power and machinery to production and distribution. Third, our population and therefore the market for products is becoming more and more evenly diffused geographically, while the use of electric power and internal combustion engines in manufacturing industry and transportation, as well as changes in agricultural conditions, have made it less necessary or desirable for industrial centers and centers of distribution to be crowded close to sources of materials and power or to rail transportation centers. Finally, large-scale mass production is not equally suited to all branches of industry, any more than large-scale extensive agriculture is suited to all branches of farming; and in many branches of industry it is becoming a question whether, from the point of view of economic efficiency as contrasted with engineering or technical efficiency, the limit of the scale of production has not been closely approached. One important reason for the latter question lies in the new importance which attaches to the problem of distribution in modern industry.

Mass Production Has Limitations

In the period of American industrial development which has passed, attention has been centered almost wholly upon engineering and technical efficiency in production. To most engineers and managers in industry this has meant merely an effort to increase the volume of production per plant in a given period of time, through heavy investment in expensive special purpose machinery designed to turn out large quantities of standardized products. Effort has been directed essentially toward increasing the speed of production, and the heavier the investment in machines adapted to this purpose the more necessary it has been to reduce the time consumed in production in order to keep down overhead costs. All of this was based on the illusion that mere reduction in time or increase in speed of production automatically implied a reduction in real costs. But the result has been only that overhead costs of management and organization in proportion to other costs have grown more rapidly than ever.

In cases where this process has been carried to the extreme, as in the Ford organization, changing consumer tastes and market conditions have forced cessation of operations for long periods of time and tremendous scrapping of equipment at enormous cost, because of the rigid limitations and inflexibility of this form of productive organization. What has been saved in time required for actual production has been lost in the time required for adjustment to new conditions, and above all in the time required for distribution of the product. Though in a narrow sense labor costs have been lower in such industries, diminishing profit margins indicate that total real costs have not been proportionately reduced, so that salvation has depended not really upon efficiency of production but upon volume of sales and absorbing power of the market. What has been achieved is efficiency in the engineering sense, but not economic or business efficiency.

This circumstance has brought our large-scale industries face to face with the fact that consumption or absorption of the product by the market cannot be speeded up indefinitely as production can. Some industries have unconsciously met this situation by producing goods which wear out or are used up more rapidly; but in the race between production and consumption, where it is based solely upon the time element, it is becoming increasingly evident that production is bound to be the winner and that in this case the winner is the loser. This is true in spite of the fact that the large-scale enterprises have been able to achieve great economies in distribution and marketing on the side both of buying and selling.

Inherent Advantages of Smaller Manufacturers

When the fundamental distinction between efficiency in terms of time and efficiency in terms of real costs is fully realized, I feel that it will be more and more apparent that the smaller manufacturing enterprise has certain inherent advantages which will make its place increasingly important in our industrial life. From the point of view solely of production the smaller enterprise has as good, if not better, possibilities for reduction of real costs in terms of labor, capital and management than the very large establishment. The labor supply can be in many instances more effectively recruited, the working process more closely and directly controlled, and the problems of labor administration and industrial relations are likely to entail less difficulty and overhead cost than in the larger enterprise. It is possible also for a smaller establishment to adjust its product, as well as its manufacturing processes, more flexibly to changes in market conditions. This is the most important consideration in the present industrial situation, where consumer tastes and habits are constantly shifting, and where the market for specialties is on the whole more favorable than for thoroughly standardized mass products. Moreover, with the new transportation facilities and the wider availability of electric power, the smaller establishment has a larger freedom of location in relation to its market, its source of material and labor than the larger plant. It should be emphasized also that the smaller establishment has a greater flexibility of adjustment to changing market conditions in that the overhead costs of shut-downs or part-time operation are relatively less burdensome than in the larger plant. This is simply another way of saying that the smaller establishment has the advantage of not being under such great pressure to reduce its time costs, and can concentrate upon reduction of its real labor, capital and management costs, in which it can achieve as good results as the larger plant.

THE author has been chief economist of the National Industrial Conference Board, New York, for the past seven years. He is a frequent contributor of articles on current economic questions to magazines and newspapers here and abroad, and is the author of books on the agricultural problem in the United States, the inter-ally debts and other subjects

How Smaller Plant Can Overcome Its Handicaps

The chief handicaps under which the smaller establishment has been laboring in the recent past have been those of securing its supplies of materials on favorable terms, and of advertising and selling its products in competition with the larger enterprises with more money to spend on national advertising and distribution agencies. It has been more difficult also in past years for the smaller establishment to secure on favorable terms a constant source of new capital necessary to alter its production programs and install improved methods, or to engage in scientific research. These disadvantages, however, have not been so serious as they have appeared to be and are growing less important as time goes on. For one thing, there has been developed since the war in this country such a vast and fluid capital market, under the pressure of enormous savings seeking investment, that it is becoming easier for the smaller enterprise whose financial position will stand close scrutiny, to secure all the capital it needs. The advantages of scientific research are becoming available for the smaller plant through trade organization cooperation, university cooperation, and the scientific foundations. Moreover, through the increasing spread and effectiveness of trade organization the smaller manufacturer is becoming increasingly able to secure the advantages of large-scale industries in buying and selling by means of syndicate purchasing and through industrial or trade association advertising. It is probable that some of the legal barriers now in the way of more thorough-going cooperation of small independent manufacturers in the fields of purchasing and distribution may be overcome within a short period of years. It is clear that this is necessary and the necessity is being more generally recognized. In this way there may grow up in the field of manufacture in a short time forms of cooperative organization under which the advantages of small manufacturing units in production are maintained, while those of large-scale production in buying and selling are achieved in somewhat the same way as has developed in agriculture.

Trend Toward Larger Plants Has Slowed Up

That these factors are playing a part in the development of American industry is suggested in the fact that the trend toward large-scale enterprise and industrial consolidations which went forward so rapidly up to the beginning of this century has tended to slow up markedly, even though it still continues. For instance, although the average number of wage earners per plant in steel works and rolling mills increased about 170 per cent between 1879 and 1914, the increase has been less than 35 per cent since 1914. In agricultural implement manufacturing the average number of wage earners per plant in 1914 was four times as great as in 1879, but from 1914 to 1921 it increased only 17 per cent. More striking still is the fact that the physical output per plant among iron and steel works and rolling mills in 1914 was approximately nine times as great as in 1879, but from 1914 to 1925 had increased only about 60 per cent. The fact that these plants are in many cases parts of larger organizations or have been consolidated into large corporate units to secure the advantages of a ready market for their securities or of large scale buying and selling, does not in any way reflect upon the productive efficiency of the smaller plant. Particularly interesting as bearing on the question of relative efficiency of the large and the small plant is the fact, shown by studies of the National Industrial Conference Board, that during the period 1919-23 the medium-sized manufacturing plants, especially those with an annual output ranging from $20,000 to $500,000, have gained in efficiency of utilization of labor over the group producing over $1,000,000 worth yearly, even though the per capita output in the latter is larger. In 1919, in the larger plants, the production per worker was $1,590 for every $1,000 produced per worker in all other plants, but by 1923 this had fallen to $1,481, a decline of about 9 per cent. In the plants in the $20,000 to $500,000 group, however, the relative production per worker increased about 6.3 per cent.

Thus the smaller manufacturing establishment would appear not only to have an increasingly important rôle in the future, but is at the present time of far greater importance in our manufacturing life than we usually realize. In 1925 about 93 per cent of all manufacturing establishments had a value of product at 1914 prices of less than $500,000 a year, and these establishments employed over 38 per cent of the total wage earners in manufacturing and produced over 28 per cent of the total value of manufacturing production.

Average Manufacturer Must Be Better Business Man in 1928

BY HENRY BRUERE

THE average American manufacturer, and that means the smaller manufacturer, will not have a rosy time in 1928. He has not had a particularly rosy time in 1927. There will be more of the same kind of competition for new business and for retaining old business that manufacturers have faced during the year just closed. There will be the same type of narrowed profit margins. But there will be an advantageous difference. In 1928, the producer who profits by experience will not expect a repetition of the exceptional business of 1926, and he will be prepared for the more exacting requirements of a period of business retrenchment. Every business man who is looking for profit in 1928 will have to be a better business man in the new year than he was in the year closed. I am basing this statement on the general prediction made by business analysts of a good but not glowing, business year in 1928.

There are various ways in which the average business man can suffer: By loss of his market through evaporation, that is, a ceasing of demand, such as certain automotive parts suppliers have faced recently; by running into the red due to internal inefficiencies; by loss of trade and profits as a result of the inroads of the big competitor.

There can be no satisfactory generalizations regarding all types of business beyond these minimum observations. There will also be no deadly uniformity in the conditions smaller businesses will confront. The smaller plants, that is the plants producing less than $100,000 in value of manufactured product in a year, represent 80 per cent of the manufacturing institutions in the country. They are located everywhere. You can't generalize about them except to say that they will face generally a slower business pace and, where they are in competition with them, greater eagerness for business on the part of national distributers. You can't generalize, that is to say, unless you are willing to make certain assumptions.

A Lesson from New England

For the purpose of this little friendly heart-to-heart talk, I am going to make an assumption. I am going to assume that all the average businesses in America are collectively on Jan. 1, 1928, in the same situation that collectively all business in New England was supposed to be in a year or two ago—that is to say, rather dubious about the future and not at all elated over current profits. The purpose of this assumption is to enable me to use some rather illuminating illustrative material recently gathered in New England in a study of progressive business policies in vogue there. The study was made by the Metropolitan Life Insurance Co. for the New England Council, a representative body of New England business men appointed by the Governors of the five States to promote the economic welfare of that section. The Metropolitan Life Insurance Co. sent experts around to look for good examples of energetic and enlightened business methods, which, if generally employed, would probably remove the gloom from the brow of the average Yankee manufacturer, and what is true of the size of the average manufacturer in the United States is measurably true of the size of the New England factory operations.

How Market Study Helped a Cutlery Plant

The outstanding fact of importance was the recognition by progressive business men that this is the age of the buyer's market. Time was when customers stood in line for opportunities to buy. The manufacturer surviving under today's competition studies his existing customers' wants and goes out to find new customers with a definite idea of his needs in mind, based on analyses of the uses to which the product to be sold will eventually be put. A case in point is the revival of a failing cutlery business built upon the basis of the black-handled knife formerly found on every farmer's and mechanic's dinner table. One customer formerly took one-third of the output. That customer stopped buying. How was the void to be filled? Household furnishing departments were studied. Kitchen cabinets and tea rooms were looked into. Knives were discovered in use that added gayety to the table and the kitchen because of colored handles. Black handles were changed to blue and business was recovered.

Simplification Aids a Shoe Manufacturer

Inventory burdens have been reduced by simplification. The classical example of the Regal shoe is again cited. That company used to make 2500 varieties of shoes to retail at $10. Records were kept of the foot measurements of customers. Many varieties were found to be made for non-existent feet. Poor business. Varieties were cut down from 2500 to 100. The price was cut from $10 to $6, with no reduction in quality. That has been a good move for the Regal Shoe Co.

Another plant, a woolen mill, reduced the 160 yarns, varying in color, material or counts, to 30, and production has been doubled.

Costs Reduced by Replacing Antiquated Machinery

Liberal machinery replacement policies are in force in the up-and-coming New England industries.

One company is reported to have decided after research that high costs were due to three causes:

1. The use of antiquated machinery and methods.
2. Unnecessary handling charges through widely separated departments.
3. Burdensome carrying charges on idle floor space and idle equipment.

The entire plant was rearranged; total floor space occupied was reduced one-fifth; departments were consolidated or moved to more advantageous locations; old machines were replaced with new machinery of latest design, most of them motor devices; special machines were designed for more economical dyeing of small lots.

A paper manufacturer studied consumers' habits and the retailer's viewpoint. Inquiry was made on the extent to which consumers buy paper by name or brand and the principal brands called for, one purpose being to test the effects of past advertising on stimulating demand for the product of the manufacturer making the survey.

How a Ball Bearing Maker Found a Broader Market

A manufacturer of ball bearings wished to broaden his market beyond the automotive industry by which his entire product was taken, and with this desirable end in view, experiments were conducted and demonstrative installations were made without profit. These demonstrations captured new and repeat orders, and a profitable business of substantial proportions has resulted.

These illustrations could be multiplied many times. They all point to the application of intelligent study to the problems of a waning or handicapped business. New vitality often resulted.

Average Business Often More Efficient Than Large Corporation

I remember a statement made to me at one time by Henry R. Towne, the famous founder of the Yale Towne Lock Co. We were discussing the problems of large-scale industry and he expressed emphatically the opinion that small business should be, and often was, more efficient because of its adaptability and the ingenuity of the owner or manager who was able to give it his personal supervision. Yet it is true that more small plants fail because of incompetent management than for any other reason. Actual production operations are usually better carried on than the auxiliary, although essential, functions of purchasing materials, securing actual costs, controlling overhead expenses, and marketing the product. This means that the manager, usually a specialist in production, must broaden his grasp of the business, and if there is no opportunity to do that, he must strengthen himself with competent assistants.

There is pertinent to this theme an almost threadbare subject, but one that cannot be ignored even in as brief a discussion as this. I refer to cost-determining. A competent accountant in a plant is worth his weight in platinum. Not a faithful drudge of a bookkeeper, however loyal and dependable he may be in handling collections or the bank account, but an accountant trained in cost-keeping and who is willing to keep himself posted in the development of his art. There should be not only an analysis of manufacturing costs, but of lines of product and accounts.

THE author, who is vice-president of the Bowery Savings Bank, New York, was born at St. Charles, Mo., in 1882. *He attended Cornell University and the University of Chicago, later studying law at Harvard and New York University. In* 1903 *he engaged in an investigation of industrial welfare work for the International Harvester Co. He became vice-president of the American Metal Co., Ltd., in* 1916, *serving until* 1923, *when he became third vice-president of the Metropolitan Life Insurance Co. He is the author of "The New City Government," published in* 1912.

What Foundry Cost Studies Showed

The president of the American Foundrymen's Association lately cited an analysis of his company's costs for a period of three years as demonstrating the fallacy of the practice among foundrymen of basing costs on the price of metal. He found that metal represented only 18.8 per cent of the cost of the product while labor and management represented 50 per cent. Pricing is a correlative of cost-keeping and, if properly done, will relieve a plant of unprofitable business and enable it to concentrate on the type of work it can do best.

Next to cost-keeping, I place merchandising or selling as the field greatest in need of attention. There are numerous illustrations of intelligent methods now used in this field by all types of company. Hand-to-mouth buying has compelled attention to consumers' needs and habits so as to anticipate demand for prompt delivery. Whether a manufacturer distributes through jobbers, sells to a small number of users or markets directly, he should get up to date on marketing.

A Market Study That Increased Sales

I have in mind the case of a belting company, which did the following things to strengthen its market:

1. It analyzed old ledgers and listed customers.
2. It grouped its customers by industry and the use they made of the product.
3. Old customers were grouped by territories, and lists of prospective customers in the same or allied lines were made.
4. Calls were made in territories where the lowest expense per call could be maintained with a view to the largest probable amount of orders. Sales territories were gradually enlarged, and new customers were added and new uses of the product were developed. The result was an increase of 20 per cent in sales volume.

One more illustration, this having to do with market evaporation. "A" was a manufacturer of castings for wagons. The inevitable happened. Cast iron hardware was first resorted to for filling in, and then cast iron toys. Castings are made, assembled, painted and packed for shipment to the distributer. The firm specialized on toys that can be retailed for 10c., and consequently it has established a year-around demand from the ten cent stores. The plant keeps track of style changes; thus, ten cent automobiles are made each year according to a popular style of automobile for that year.

Cutting Costs Through Personnel Control

A word should be said about securing the cooperation of employees by the systematic development of personnel work. Such cooperation can be made to reduce costs as in the case of the American Chicle Co., where there is a close coordination between the production department and personnel control. In three years, the employment department reduced the plant force about 20 per cent, securing more production and reducing turnover 50 per cent.

On each Wednesday, a budget

of the working force is prepared on the shipment schedule for the following week, submitted by the sales department. An organization chart is prepared for each department corresponding with this budget. On Friday, each foreman receives his personnel budget. The number of machines of each kind which will be run is listed; the names of the girls who will run them, and their substitutes, and the quantity of work that must be turned out in the department. On the following Monday, the schedule goes into effect, and each morning the assistant personnel director checks up to see that the schedule remains in effect, at the same time taking the absence record.

Every Manufacturer Must Keep in Touch with His World

I have tried to indicate the need for alert attention to the refinements as well as the obvious commonplaces of management. A business man, especially a manufacturer, must keep in touch with his world. He should join his trade association, and if that is wanting, help form a local association of plants having management problems in common. He should read his trade journal and a good magazine on management. He should visit other shops and talk with men of similar responsibility. He should read the economic news in a good business paper and occasionally attend a convention where pertinent management questions are discussed. The small manufacturer needs to be a student of management as well as the technical aspects of his industry. He needs competent assistants, and he must take time to analyze his business periodically and thoroughly. He should take advantage of sources of technical and management information available for little or no cost, such as have been indicated, and he should learn to use the Department of Commerce, the universities, and such agencies as the policy holders service bureau of a large life insurance company, of which I advise him to inform himself. Above everything, he should make use of the services of a progressive bank equipped to help him study and strengthen his financial practices. He should budget his business.

If he will do these things, he will survive more difficult years than 1928 is likely to prove, and he will make a profit in ordinary years if his business is soundly conceived and economically justified. Not all manufacturing, any more than all other business, deserves to persist. Not all smaller businesses should remain independent. But at least no well conceived and efficiently conducted business is likely to perish or to be overlooked when consolidations are under way.

The smaller successful business is a great national asset and a great boon to its owners and managers. It is certainly worth all the energetic and alert attention that a capable executive can bestow upon it.

Study Your Business

I sum up what I have to say to the average plant owners and managers in the sentence: Study your business; study the methods of other businesses, especially those that can afford to experiment and have applied the results of experiment, and apply them, to the extent that your good judgment dictates, to your own business. Whether you are a practical man, a technical man, a combination of both, be a student also.

The American business man is hard worked, but he still wastes a lot of time in futilities. That is all right if he can afford them. If not, why not give one movie night and one lodge night a week to studying your business and like businesses?

How Ohio Plants Are Meeting Current Problems

BY F. L. PRENTISS

A SURVEY of the business outlook for the small or medium-sized plants in the metal-working field indicates that little has been done, in northern Ohio, at least, to work out constructive plans to meet a situation that is largely due to excess capacity. There are few complaints that the moderate-sized and small plants cannot compete with large ones. However, there is a continued tendency on the part of automobile manufacturers to centralize their manufacturing at their own plants. While this tendency is not new, it is still going on and is probably felt more by manufacturers in northern Ohio than elsewhere.

Smaller plants in the automotive field, such as stamping plants, find it necessary to adopt production methods and put in equipment that will enable them to produce economically, but they take big chances if they have to make large expenditures for conveying and other equipment for special work, because they never know how long they will have the contract for a particular job. If they lose it, considerable of their equipment may be rendered almost useless. For example, one company three or four years ago went to large expense in putting in complete foundry molding units for making certain automobile cylinder blocks.

THE author has been resident editor of THE IRON AGE *at Cleveland for 20 years, and is a close student of developments in the metal-working industry.*

Now it has lost this business, because with the building of the new foundry the motor car company will make its own cylinders. This shifting of work in the automobile field, however, does not always indicate that the motor car builders themselves can make parts cheaper than outside shops.

One factor that enters into the situation in respect to the small shop in the automotive field, particularly the stamping plant, is the price of steel. The automobile manufacturer, when it takes bids for work, asks the shop at what price it figures its raw material. If a price is named that is higher than that at which the automobile company is able to buy material in large quantities, the automobile manufacturer insists that the parts maker bring pressure on the mill to obtain a price equally low. However, handicaps in buying raw material do not seem to have been serious recently, because of the condition of the steel market.

Stamping Plants Seek Specialty Business

Faced with present conditions of excess capacity, metal-working shops are groping around in search of other products, preferably those that they can make on equipment they have, so that the equipment can be kept operating.

Some of the stamping plants that specialize on production work in the automotive field are turning their attention to specialties in order to have more varied lines of work and to fill in when the automotive industry is slack. One Cleveland company that is devoted largely to automobile parts has built up a satisfactory business in stampings for moving picture machines and has recently commenced the manufacture of all-metal folding card tables to take the place of wood tables commonly used. While this seems to be a rather limited field, it helps out.

Malleable foundries have been hit as hard as any industry by their excess capacity and some are getting into specialties to help them out, particularly during periods when the demand for castings is slack. These products include pipe hangers, truck wheels, conduit boxes for electric wiring, and posts and panels for railings on highway bridges.

Ventures Into Specialty Field Not Always Successful

Contract machine shops also have been adversely affected, and operators of these shops say that they do not see much hope for the future unless they get into the manufacture of some line of special products. However, these ventures are not always successful. For example, a Cleveland machine shop developed a special machine used in the rubber industry—spent considerable money for patterns, etc.—and did remarkably well for a short time, but a change in the process in making rubber automobile tires made the machine obsolete. A complaint of the contract machine shop is that its business is overflow work and that automobile companies, particularly, do not farm out work unless they are very busy. Operators of small machine shops contend that large manufacturers often do machine work in their own plants to keep their own men employed when conditions are rather dull, although they could often get this work done outside cheaper than they can do it themselves.

Efficient Management Key to Success, Says Manufacturer

A northern Ohio company which might be classed as medium-sized and which is apparently a successful manufacturer of a varied line of products, including screw machine products, tanks and automobile and aeroplane parts, offered the following views on the outlook for the average plant:

"There is a field for the small or medium-sized plant if it is well managed and if it concentrates on one product. Good management implies low production costs brought about by proper plant arrangement and the use of modern labor-saving equipment. A small metal-working plant is in better condition to compete with a large one in any particular line if the small one is better managed than the large one.

"If a plant is quite small it cannot have separate departments for making different products, as each department requires proper supervision and men trained to do work in that department. It would not be advisable to switch foremen or mechanics from one class of work to another. If a plant is not large enough to be organized into departments for making different products, it should stick to one product. It is the ambition of about every small manufacturer to grow and get big, and many have been able to do so by confining their efforts to one line of products. Many of the large successful manufacturers in the metal-working field today started in a very small way and succeeded by efficient management. Many others are doing experimental and development work today in small shops which will eventually grow into big manufacturing companies.

"If a small manufacturer will concentrate on one product, he will be in a position to adopt production methods that will bring down his costs and enable him to compete with the large manufacturer. He should watch the new developments in labor-saving machinery. If a machine tool is brought out that will reduce his manufacturing costs and he installs that machine but his competitor does not, he has an advantage over his competitor to that extent.

A small manufacturer, if his plant is large enough to divide it up into departments, should diversify his products so that he can keep busy in some lines while others are slow. The new lines added may be either specialties or standard products.

"The small manufacturer is at a disadvantage as compared with a large manufacturer in that he has to pay more for some lines of material, such as cold-finished steel, tool steel and high speed steel. This is because the larger manufacturer is able to get lower prices by buying in larger lots. However, a shrewd small buyer can overcome this handicap to a considerable extent by closely following the market and finding what other consumers are paying for the same material. He can often get some concessions by pointing out to steel salesmen that a big competitor is buying material at a certain price and that if he is to keep in business and meet competition in the same line he must have as favorable a price.

"While an organization to carry out the details of scientific management is not practical in a small plant, the head of a one-man organization who has full responsibility for the operation of his plant, can by his efficient personal management attain the same results that are sought to be attained in a larger plant by the installation of a system of scientific management."

To sum up the views of this manufacturer, the outstanding factor in the successful operation of plant, whether small or large, is efficient management. The success of the plant depends on this. He used the term "efficient management" in a broad sense, to include adoption of production methods and the installation of up-to-date equipment which would bring down the costs of production to a minimum.

A Practical Management Program for a Small or Medium-Sized Company

IN a period in which the pressure of competition has been steadily increasing and small plants, as well as large ones, have been confronted with the necessity for greater efficiency, attention has been focused on management. In the smaller plant, where close association between employer and employee still prevails and where the initiative and enterprise of both are usually of a high order, there is still considerable skepticism regarding the employment of many of the scientific management mechanisms that have found their greatest development in large organizations. The smaller manufacturer knows that he must make further gains in the battle against costs, but he hesitates to reorganize his management methods for fear of burdening himself with a cumbersome and unwieldy routine, unadapted to his needs.

F. W. SHIBLEY, who expressed his views in this interview, is vice-president of the Bankers Trust Co. of New York, with which he has been connected since 1920. *Before that time he was for over* 20 *years an investment banker for his own account.*

A director of several large industrial corporations, Mr. Shibley has had the opportunity, both as a banker and through participation in the management of many industries, to gain a practical knowledge of industrial operations. During the late reconstruction period he joined actively in the reorganization of several important manufacturing corporations.

In an effort to clear the atmosphere for manufacturers of this class, THE IRON AGE interviewed F. W. Shibley, vice-president Bankers Trust Co., New York, a keen student of scientific management and thoroughly familiar with its practical application. The questions submitted to him, with his answers, follow:

"To what extent are the principles of scientific management applicable to a small or medium-sized plant?"

"This is an age of specialization in industry," replied Mr. Shibley, "a specialization which is being constantly extended and refined. The trend is toward larger units of operation in order to secure the benefits of mass production in the reduction of costs and to employ the services of executives possessing the exceptional ability to comprehend, organize and control the operations of a large business on a scientific basis.

"Nevertheless, human nature

does not change with fluctuating economic conditions. There will always be the desire on the part of a great many men to act independently of the economic trend and to manage and control an enterprise of which they are the dominating force, even though that enterprise is comparatively a small one. Such a business can attain a success if well managed, and it can attain a very considerable success if operated under the principles of scientific management, which imply an accurate knowledge of markets gained through systematic sales research and resulting in an accumulation of ascertained facts on which to base an annual forecast of probable sales by units and dollars, planned production based on such a forecast and control of operations as planned through a budget, corrected, if such correction is needed, at least monthly.

"No business is too small to require good management, and no management is so good that it cannot be improved by utilizing the principles of scientific management."

"Is there danger of building up too cumbersome machinery for production control?"

"Yes, if the executive management is unintelligent and inefficient, in which case the system is of little value. Under a management which understands the system, overhead can be reduced greatly, for it demands that heads of departments all down the line function properly, and when they so function, red tape with its excessive clerical expenditures disappears. The more highly refined a complicated machine becomes, the more efficiently and economically it operates. Scientific management demands that the highly paid executive heads of departments operate and control the business, doing exactly what they were hired to do."

"To what extent is it economical to scrap old equipment and plant and replace with new?"

"The limiting factors are cash working capital and the economic position in trade of the product. A new machine, as a general rule, must justify its replacement of an old one by effecting a saving equal to its cost in a period of from 5 to 10 years. In this age of mechanical progress obsolescence is much more rapid than in previous times. The economic position of the product in trade ties into this formula and becomes an essential part of the problem, for just insofar as the market potentialities of a product are assuring as to price and volume can management venture beyond the dead line of the definite amortization period as above stated."

"Is there danger in investing too heavily in special-purpose machinery?"

"There is grave danger. The reason is outlined in the answer to the previous question."

"Should the smaller plant regard as one of its advantages the lack of excessive specialization that makes it difficult and exceedingly expensive for a mass production shop to change its product in response to new demands?"

"Yes. Mass production is exceptionally effective when mass buying is obtainable. It is particularly the province of the large industrial enterprises. It does not lend itself to a small operation except insofar as the flow of production along a proper line of machinery is concerned. The profit of the small or medium-sized plant is not to be looked for in the production of staples made in quantities and sold under fiercely competitive conditions, but in specialties, the general market for which seems to be broadening.

"It should be the study of management to make the small or medium-sized plant as flexible as possible so that it will be prepared to respond quickly to style changes in its present products or to adapt itself to new products in its line."

"What kind of cost-finding system is best suited to the small or medium-sized plant?"

"The system which will be best adapted to establishing a standard cost for each item of operation under the terms of a flexible budget and which will tie into the balance sheet accurately each month. The sales dollar is a true measure of costs, and monthly comparison of actual costs with budgeted costs and standard costs will result in a short time in a reliable and accurate cost system."

"To what extent is budgeting practical?"

"Just as the forecast of sales is the dominating factor in the system of scientific management the budget is the controlling factor. It maintains the entire system in balance and is indispensable. Without the budget there cannot be effective scientific management. Opinion will dominate, not facts; therefore the budget is essential, and the cheering fact is that, being less complex in a small business than in a large enterprise, it is more understandable and its inevitable conclusions more convincing and effective."

"What purchasing policy should be followed by the smaller manufacturer? To what extent should he buy raw materials in quantity? Are zero inventories of greater importance than low material costs?"

"Purchases of materials should be made only as required by the terms of the production budget. If the manager of a business possesses sufficient excess working capital to enable him to speculate in, say, pig iron or cotton, that is his privilege as a free American citizen. If he borrows money for this purpose he does so at the risk of the solvency of his business. Under planned production and budgetary control an inventory can be turned much faster than formerly. The quickly revolving inventory minimizes even the advantages of speculative purchasing.

"In any event raw materials bought in excess of production requirements should be carried at the expense of the capital account and not the operating account. In the past, costs have been distorted both up and down through speculative purchasing of raw materials."

"What can the manager of a small or medium-sized plant do to improve his selling methods? Should he seek stabilized demand through developing a variety of products? How can he more intensively cultivate old markets and develop new ones? What advertising methods should he use? Should he support group advertising?"

"Let him study his markets and specifically let him gain a personal knowledge as far as possible of every factor entering into the distribution of his products. He must answer each one of these questions for himself. He cannot answer them intelligently unless he makes such a market study as has been suggested. Market study is not only a matter of statistics, but one of psychology. He will doubtless discover that he should develop the smallest possible number of products and that he should employ only such advertising methods as shall serve to keep his company actively in the minds of the distributers of his products or shall prove effective in selling them to consumers. He will ascertain undoubtedly that trade paper advertising is the best medium for keeping his company and its products before the trade and that applied advertising, as a sales stimulant, can be made very effective if done after intelligent market study. Advertising is being applied for the direct purpose of producing sales of a specific article in a specific market with remarkable results.

"Your last question embraces the entire territory of sales research and market study. Many managers of small plants have felt that sales research and market study were only for great corporations. It is decidedly unprogressive in them not to strive to follow the lead of the great successful industries and to learn all that is humanly possible for them to learn of the best methods of modern merchandising and distribution."

Migration of American Industry

Movement Traceable from East and West Into Indiana-Ohio-Michigan Section—South Gaining in Importance

BY SIDNEY G. KOON*

THERE have been many statements in the past year or two to the effect that the industrial center of the United States, which long has been moving at a slow pace toward the setting sun, had started to retrace its steps eastward. Specific instances have been cited of industries moving back toward the point of origin of American manufacturing and certain hazily defined trends have been discussed. In an attempt to trace this movement quantitatively several analyses have been made which are covered in some detail in later paragraphs.

Among the statements indicating a migration of industry was one by Hon. Herbert Hoover, Secretary of Commerce, in an address before the Mississippi Valley Association, Nov. 14 last. A portion of that address follows:

> "While the Panama Canal has carried great benefits to our people, we cannot ignore the fact that it has contributed also to distort the competitive relationships of the Mid-West and our seaboard business and industry. It has drawn the east and west seaboards much closer together by greatly decreasing transportation costs, and therefore tends to draw an area of Pacific's business, formerly enjoyed by the Mid-West, toward the Atlantic States. We can roughly visualize the combined effect of the canal and higher rail rates if we set up a new measuring unit in the shape of the number of cents which it takes to carry a ton of staple goods at present rates.
>
> Using that measuring rod and taking the cheapest routes, we find that before the war New York was 1904c. away from San Francisco, while now it is only 1680c. away. But a given Mid-West point, which was 2600c. away from the Pacific Coast before the war, is today 3114c. away. In effect this Mid-West point has moved 514c. away from the Pacific Coast, while New York has moved 224c. closer to the Pacific Coast. A similar calculation will show that in the same period this Mid-West point has moved 694c. away from the markets of the Atlantic seaboard and South America.
>
> All this causes certain types of Mid-West business to migrate to seaboard. It steadily tends to establish manufacture nearer to seaboard and farther from the heart of agriculture, to the mutual disadvantage of both. It likewise has a tendency to limit the area of Mid-West wholesale distribution. Individual merchants and manufacturers in the interior can give many instances of it all"

Another straw, so to speak, was made public by the Department of the Interior on Nov. 18. This states that the center of production of electricity by public utility power plants, after having moved westerly between 1907 and 1917, turned toward the southeast between 1917 and 1926.

Figures compiled by A. H. Horton of the United States Geological Survey located that center in 1907 at a point in Lake Michigan about 45 miles northeast of Chicago. Ten years later it was about 65 miles west by north of Chicago, "having moved about 85 miles in a southwesterly direction. In 1926 it was 55 miles west by south of Chicago, having moved about 20 miles in a southeasterly direction." During

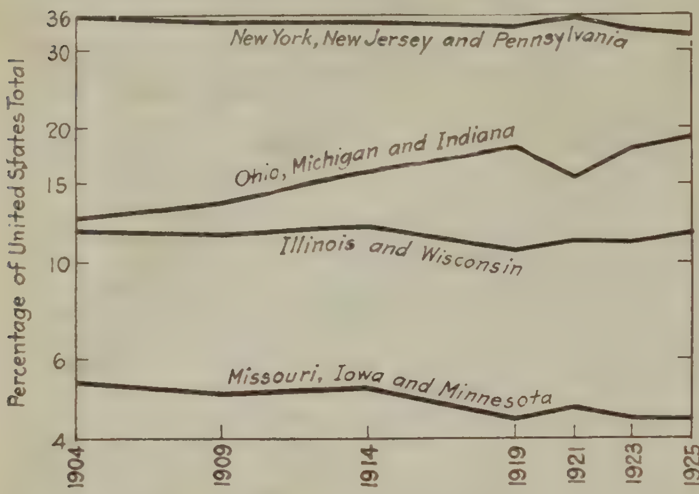
TWENTY-THREE Years Ago the Center of Manufacturing in the United States, as Shown by Distribution of Wage Earners, Was About 95 Miles East by North of Columbus, Ohio. Its progress westward with the passing years is traced on the map. It now is about 9 miles from the center of Columbus. Not far away is the center of THE IRON AGE *circulation* this period of 19 years the output increased from 10.6 to 73.8 billion kilowatt-hours, or nearly 600 per cent. Population increase during the same period was given as 34 per cent and per capita use of electricity as 122 kwhr. in 1907 and 630 kwhr. in 1926.

---

*Associate editor THE IRON AGE, New York.

Methods of Studying the Movement

BOTH general manufacturing, as reported by the United States Census Bureau, and the production of iron and steel, as reported by the American Iron and Steel Institute and THE IRON AGE, have been analyzed for the purpose of determining the movement of industry. In the iron and steel field the production of pig iron has served as the basis for one study, while the production of rolled iron and steel products is the foundation for another. General manufacturing has been taken up in an analysis which follows State lines.



ELEVEN States Produce Two-Thirds of Our Manufactures. Their relative outputs are shown in the two diagrams on this page—that above being figured from the "value added in manufacturing," while that at right is based on the number of wage earners. Both show that the heavy gains of Ohio, Michigan and Indiana are at the expense of both the eastern and western groups

It has been covered also on the basis of production in large cities, principally so that the eastern and western sections of Pennsylvania, for instance, might be separated, and similarly in some other cases.

Several methods of attack are available in any such study. The one occurring most directly to anyone undertaking this work is to use the total production of the manufacturing plants. For some reasons this is not a thoroughly satisfactory base, because there are so many duplications, particularly where the finished product of one establishment goes in as raw material in the next, and thus through several ramifications appears twice or more in the final figures. One way to get around this is to use the "value added" to the raw materials by the manufacturing process. This avoids all such duplication, but unfortunately the figures have not been available for all of the analyses desired. A third base, which in the long run ought to be practically parallel with the "value added," is had by considering the number of wage earners.

Central Point in Manufacturing

Another method of approach, which disregards separate districts but shows the movement of the center of activity of the country as a whole, gives an interesting answer. Calculations made from the 1904 census of manufacturing in the United States place its center at a point about 91 miles to the eastward and nearly 19 miles to the northward of Columbus, Ohio. A similar calculation for 1909 shows that the center had moved westward nearly 17 miles and southward about three miles, being correspondingly closer to Columbus.

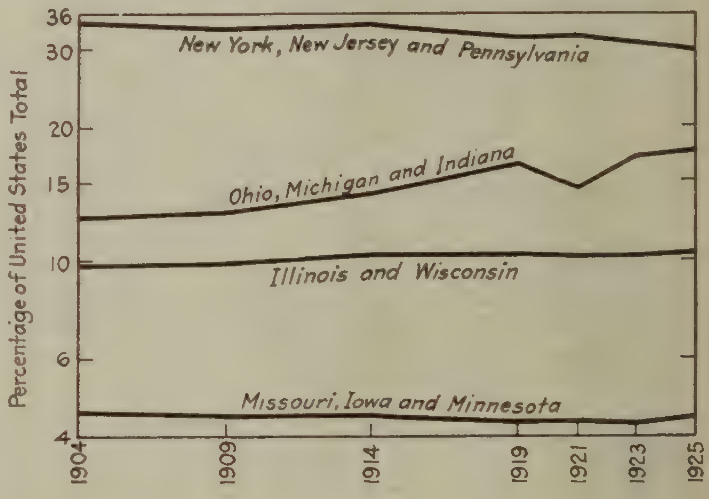
A shorter movement brought the center in 1914 to about 71 miles eastward and 17 miles northward of Columbus. The distance moved in that half-decade was only about four miles. A large jump was made in the next five years, placing the center in 1919 about 23 miles to the eastward and 18 miles northward from Columbus. During the next two years the movement to the west was interrupted, for the center, by 1921, had moved 11 miles farther east and five miles farther south.

By 1923 this eastward digression had again been reversed, the movement placing the center about 17 miles eastward and 13 miles northward of Columbus. In 1925, which is the latest date for which figures are available, the center had approached closely to the outlying portions of the Ohio capital. As nearly as it can be calculated, it was about 3½ miles to the east and 8 miles north of the center of the city.

It is interesting to note, in connection with the recent positions of this center of manufacturing activity of the United States, that the center of distribution of the circulation of THE IRON AGE also is close to Columbus. Figures for the first half of 1927 show that location to be about 10 miles east and 21 miles north of that city. It thus is in the same direction from the city as is the manufacturing center, and the two are but 15 miles apart.

Comparisons on Percentage Basis

TO eliminate the uncertain influence of varying business conditions comparisons have been made, not of the total output or number of employees or dollar value, but of the percentage of such quantities which each State or section contributed to the total for the United States. Using this method, a clearer conception is had of the relative changes up and down as among the various States and sections. It cannot, of course, take account of the fact that changes in business conditions do not affect all sections proportionately. With this single disability, however, it appears to be the most rational means of obtaining the desired result.



Rolled Iron and Steel Production

A definite movement into Indiana, Michigan and Ohio, considered as a group, is observable when studying the production of rolled iron and steel in the United States from 1911 to the present time. This movement comes from both directions, that is, both east and west. It does not come from the south, for that region itself is showing a steady growth.

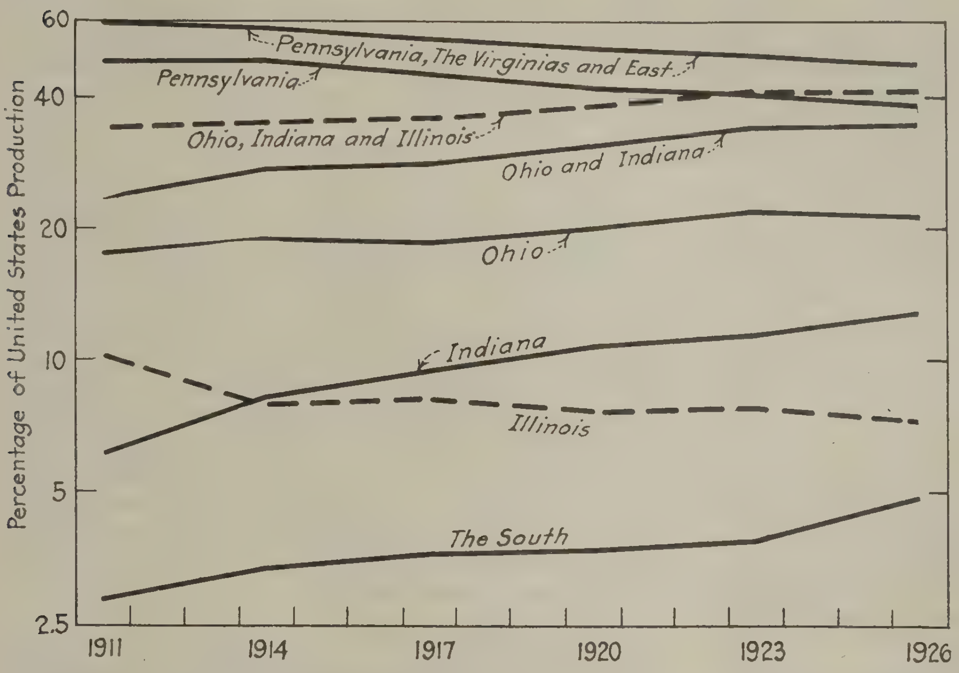
In 1911 and 1914 (the figures, for ease of calculation, were taken at intervals of three years). Pennsylvania furnished about 49½ per cent of the total. That percentage has now dropped below 39. Meanwhile Indiana has increased from 6 per cent to 13 per cent of the country's total and Ohio has advanced from 18 to about 22 per cent. As a result, even though Illinois has shown a drop comparable with that of Pennsylvania, the group of three States—Ohio, Indiana and Illinois—has now passed Pennsylvania, having a total of 42 per cent of the country's aggregate output in 1926 against only 34 per cent in 1911.

Conditions in the South show an uninterrupted gain, from less than 3 per cent in 1911 to almost 5 per cent of the total in 1926. This includes all territory south of the Ohio River, with the exception of the two Virginias. It reflects the growth in importance of the Birmingham region particularly.

Movement of Manufacturing in General

Concentrating our study upon that portion of the United States lying west of New England, north of the Ohio River and east of the Missouri River, we have a territory comprising 11 States, forming the most intensive large manufacturing area in the country. They cover 18½ per cent of the nations expanse, contain 49 per cent of its inhabitants and produce 67 per cent of its manufactured products. Three or four of the States included are large factors from the agricultural viewpoint, but contain heavy manufacturing activity also.

Taking the so-called "empire group" of New York, New Jersey and Pennsylvania, there has been a drop from 34 per cent of the total wage earners in the country in 1904, 1909 and 1914 to about 32 per cent in 1919 and 1921 and some 30 per cent in 1923 and 1925. Accompanying this decline in the eastern States of the region under discussion is an increase in Ohio and Michigan from 10 per cent of the country's total in 1904 and 1909 to about 14 per cent in 1923 and 1925. In both cases the movement was irregular, but the net change was a considerable drop in the empire group and a corresponding increase in the Ohio-Michigan group.

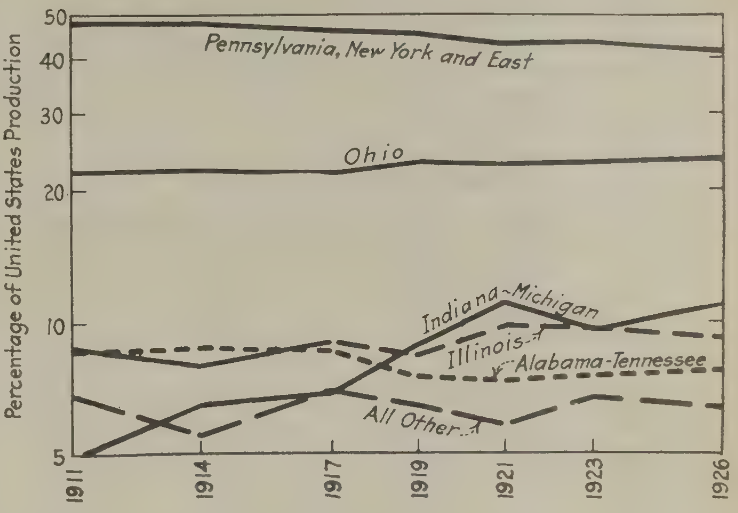


Regarding Indiana and Illinois as another group, their 10 per cent of the total employment in 1904 to 1914 inclusive has increased to 10¾ per cent in the two most recent years. This moderate gain has been made mostly by Indiana, which has gone up from 2.84 per cent of the total in the three earliest years to 3.33 per cent in the two latest years. The territory west of the Mississippi, comprising Missouri, Iowa and Minnesota, considered together with Wisconsin, has held practically uniform at about 7¼ per cent of the total number of wage earners of the country.

It thus follows that, disregarding New England, the South and the Far West, the Ohio-Michigan group has benefited in expansion of industry at the expense chiefly of the empire group. This study does not show, in the same way as with the rolling mill study, a movement from both west and east into the middle section. It does show, however, that that middle section is growing faster than the sections surrounding it and to the (relative) loss of some of them.

Study of the Cities

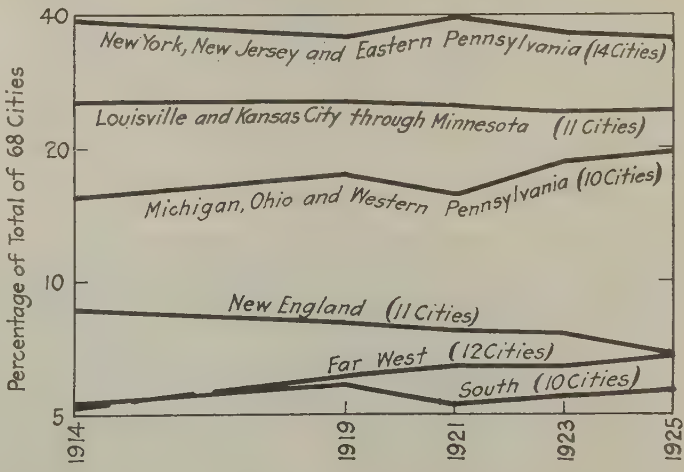
More than four-ninths of all products manufactured in the United States are produced in the 68 cities which had in 1920 a population of 100,000 or more. This does not include production of suburban areas, and in particular, so far as the steel industry is concerned, it does not include the production of the large number of small cities containing steel plants. Bethlehem and Gary and Lackawanna are notable examples. These 68 cities are here considered as divided into six groups, each of from 10 to 14 cities. Analysis of the changing volume of manufacture in the manufacturing census years 1914, 1919, 1921, 1923 and 1925 is considered for these groups separately.



PIG Iron Production, by Districts, Is Traced Above. Indiana and Michigan, as well as Ohio and Illinois, have been gaining at the expense of Pennsylvania and the East

At Left Is the Production of Rolled Steel in the United States. Ohio and Indiana show huge gains in their proportion of the total—at the expense, mainly, of Pennsylvania and Illinois

Below Is the Manufactured Product Showing of 68 Cities, Grouped in Six Sections of the Country



In some respects the study of production in the principal cities has yielded results similar to those in preceding paragraphs. Taking the census figures for 1914 to 1925 inclusive, the cities showed their highest proportion in 1921, with 46.98 per cent of the total. Their lowest came in 1925, with 44.81 per cent. All of the other census years showed between 45 and 46 per cent.

There has been a slight falling off in the territory covered by New York, New Jersey and eastern Pennsylvania, in which 14 of these cities are located. There has been a slight falling off in the section around Chicago, including eleven cities, in that area from Louisville and Kansas City, on the south, up to Minneapolis on the north. There has been a decided gain, as shown by the other studies, in the area comprised by Michigan, Ohio and western Pennsylvania, represented by ten cities.

New England's proportion has declined steadily, as shown by records of its eleven cities. The South has shown a moderate gain, represented by figures from ten cities, while the Far West and the Southwest have shown a consistent gain considerably exceeding that of the South. This western area, which contains twelve of the cities, has almost reached the New England percentage of the total, although in 1914 it was only six-tenths as great as New England.

To the tremendous expansion of the automobile industry may probably be attributed the movement which we have traced. Michigan, Ohio and Indiana, considered as a group, is the principal and predominant seat of that industry and its main auxiliary services of supply. And it is precisely into that area that we have found industry going from contiguous areas on either side.

One element which may be noted lies in the relative recession of industry in that area in 1921. Examination of automobile production figures shows a correspondingly heavy reduction in that year in the production of cars. Only 41 per cent as many cars were produced in 1921 as in 1923, whereas for manufacturing as a whole the ratio was 72 per cent. The tie-up between that one industry, which now appears to have reached its full growth, and the relative movement of manufacturing activity into the area dominated by that industry is striking.

Steel Scrap in 1927 Was $3.35 Below Eight-Year Average

New Conditions in the Trade Operate Against Speculation and Fluctuating Prices—Last Year Average Price the Lowest Since 1921

CHANGING trends in the buying and selling of scrap iron and steel, upon which attention was focused in our Annual Review Number of Jan. 6, 1927, have operated throughout the past year to minimize the high degree of speculation which formerly existed and to establish scrap trading upon a basis of quick turnover, small profits and low prices.

In only one year since the war, 1921, have scrap prices averaged lower than in 1927. Heavy melting steel, the grade in which there is the largest consumption, averaged $1.48 lower in 1927 than in 1926, taking prevailing quotations in the Pittsburgh, Chicago and Philadelphia districts as the bases for a composite price. This composite price was $14 in 1927 as against $15.48 in 1926, while the average for the years from 1919 to 1926, inclusive, was $17.355.

The downward trend of prices is not alone accounted for by the fact that the steel industry and other metalworking units which consume scrap operated at a lower rate in 1927 than in 1926. Other factors were at work. Railroads have improved their methods of gathering scrap and their shipments both from their own scrap piles and from the plants of private manufacturing companies have been prompt. Scrap consumers themselves have taken a hand in the situation by purchasing in moderate-size lots and thereby avoiding the speculative flurry which at times in the past has followed every large transaction.

Scrap Handled More Economically by Steel Plants

When brokers and dealers have only moderate-size orders in hand they do not scramble to cover and outbid each other in their anxiety to protect themselves against loss. Steel companies have quite generally adopted the policy of releasing orders or shipping instructions only as they need material and this regulation has resulted in steel plant economies because much of the scrap coming into the steel plants is unloaded directly from cars to the open-hearth charging boxes instead of being piled in the yard for rehandling as required.

While there has been no oversupply of heavy melting steel of the best grades, the supply of secondary grades has been very large at all times and the market has not been affected by the speculation which usually has accompanied any signs of a shortage.

Conditions in the trade, while operating largely to the advantage of the buyer, have reduced profits for the seller, and most particularly for the yard dealer. In former years the scrap yard existed almost wholly on the speculative features of the market, but the extremely narrow margins have left little or no opportunity for the dealer to speculate. Railroads and manufacturing companies to a large extent are preparing their scrap so that it is ready for the charging box, and this has worked to the exclusion of mixed yard scrap, which in former years was prepared in the scrap yard. Some of the largest dealers have discontinued the operation of yards, and it is only the small dealer, with a minimum of overhead expense, who can cope with the present situation.

Large Shipments by Water

Water shipments have assumed a larger importance in the past year. The Bethlehem Steel Co. has moved not less than 125,000 tons from Detroit and other cities on the Great Lakes to its plant at Buffalo, whereas in the preceding year it moved only 50,000 tons in like manner. In addition to Bethlehem's water shipments, the Otis Steel Co. brought 20,000 tons of steel scrap from Detroit to Cleveland, this being the first time that scrap from Detroit was moved to Cleveland by water. These water shipments have operated to the advantage of the purchasers in keeping prices low at the delivery points, water transportation being so much cheaper than haulage by rail.

A transatlantic shipment of alloy steel scrap from England to a Chicago steel plant, consisting of 1200 tons, was a departure. Other boat loads are to follow, relieving in Chicago the shortage of alloy scrap, which is produced there only in small quantities, and therefore is not usually separated from other steel scrap.

The Eastern market situation has been changed by the adoption of more stringent requirements by the Bethlehem Steel Co., the largest Eastern user of scrap, and further by the virtual withdrawal as a buyer of the Sparrows Point plant of that company, due to increase in Bessemer steel-making capacity to an extent which makes Sparrows Point self-contained as to scrap.

Conditions at the opening of 1928 seem to indicate that market advantages will continue to lie largely with the buyers rather than with the sellers of scrap. There is nothing at this time to point to scarcity of supply or high prices.

American Foundries Through European Eyes

Democratic Social System Mainspring of American Achievement—Sees New Market for Malleable Castings—Suggests Electric Forehearth—Stresses Need for Single Cost Language

BY MORTEN GRINDAL*

THE foundrymen's convention in Detroit in 1926 was a red-letter event in the history of international relationships in the foundry industry. For the first time organized bodies of leaders from foundries in a large number of countries came to study American plant practice. Their praise of the unforgettable days they spent while the official visit lasted has been voiced in numerous ways and in superlative terms.

The writer had the good fortune to be one of the number of delegates. While he participated in the extensive program before, during and after the Detroit meeting, he feels that the many months he spent later in the United States were of much greater value to him. It was literally impossible to digest fully the large program rushed through in the comparatively short time of the convention week. In his subsequent sojourn the writer visited 51 American foundries and one by-product coke plant. He talked with more than 1000 foundrymen, and had ample opportunity to study the many details in all conditions of American work and life which have a bearing on the resulting prosperous conditions in that field. If a short account of his experiences and views may be of any value to his American colleagues, he feels that but a small repayment is made for the very cordial and courteous treatment he received from every one of the large number of leaders of the American foundry industry with whom he came in contact.

The visits included foundries of all branches of the industry and covered plants of widely varying capacities—from an artisan's humble works in the Watchung Mountains, run by his wife, his son and himself, to the other extreme of Ford's immense foundry in the Fordson plant. The list contains a large number of jobbing foundries with the most diverse types of equipment and production—stove foundries, radiator shops, foundries for soil pipe and fittings, shops for a variety of classes of mass production using different conveyor methods, plants producing pipe in vertical sand molds and also by centrifugal methods, a number of malleable cast iron foundries, steel foundries run on a production basis and for jobbing purposes and, finally, non-ferrous shops in all branches of the field, including the manufacture of die castings. The melting units in the plants visited include virtually every known practice: the cupola, the crucible, the converter, the air furnace, the open-hearth furnace, the electric furnace and, in some cases, a combination of some of these units.

Freedom from Caste Our Greatest Asset

THE problem the writer would like to discuss first is one common to all American industries, and one which was talked about in almost every foundry he visited:

Why is it that the European workman produces more in the United States than he does in Europe? And hence, why is America the more prosperous?

Many delegations have come to America to study this question, and many learned reports with a mass of statistics have been submitted to the various local authorities. And nothing more has come of it. Not

---

*Lillehammer, Norway.

one of these reports has—so far as the writer knows—touched upon what he considers the basic difference between the conditions of life in the old and the new world: the social system.

America, being fortunate in not being tied down to traditions developed through thousands of years of history, bases its activities on the spirit developed by the pioneers in their westward march of conquest, with the individual depending entirely upon his own efforts to achieve success and seeking cooperation for defensive purposes. It was the old law of the survival of the fittest, applied to the extreme. It is these fundamental principles, but little infringed on by the American society of today, which no doubt constitute the main reason for the universally recognized leadership of American enterprise.

It is easy to point to the rich natural resources of the broad American continent, but the country in Europe which possesses the most valuable resources is governed by socialistic principles. American society builds on the instinct of individual self-support: Every man for himself—sink or swim. Again, the road to the top is open to each one who is able to climb it, unhampered by conditions of breed or creed. A man's success depends mainly on his achievements, and the results he can show will determine his position in the scheme of things. The very ablest become leaders and in a nation with 120 million people there is bound to be a large number of eminent brains. Thus the American system will, without much friction, cause the individuals to segregate into the places in the social scale where they will be of the greatest service to the community and to themselves. The unlimited opportunities offered in a nation where even the chosen leading executive may come from a humble home in a country valley is naturally the best tonic for concentrated action that may be offered any ambitious youth. America thus makes the most of the greatest natural resource in any country—the human brain.

For the sake of comparison, consider for a moment the class system ruling the old countries of the world, cast to its present mold thousands of years before modern industrialism was ever dreamt of—where leaders of society and enterprise are selected by birth and not by ability, where promotion depends more on friendship and intrigue than on natural gifts, where the laborer at the bottom rung of the ladder recognizes the impossibility of ever getting a fair chance, and where he feels and believes himself abused by the community in which he lives and, embittered, resolves to be of as little service as possible. There the friendly spirit between producer and executive met with in almost every American plant is an unknown quantity. A superintendent in a malleable cast iron plant in the United States remarked to the writer: "The men in this shop are my best friends. We live for 10 hr. every day together. If these fellows aren't my friends, I have none." The writer could have no better wish for the future of the foundry industry in Europe than that such a remark could be heard as a common occurrence among the sand heaps in the shop. Is it any wonder, then, that the European workman, finding himself freed from the bonds which tied him down in his native land, feels the buoyant effect of his economic liberation, directly measured by his ability and willingness to forge ahead? Is it surprising that he works, and works hard?

American Molder Aided by Pneumatic Equipment

ALTHOUGH the American workman admittedly shows a general willingness to produce to the limit of his capacity, it has naturally been the directing intelligence of inventive spirit and administrative ingenuity which has been responsible for the great evolution in the American foundry industry in the last few decades. To aid him in his efforts, the American foundryman has today about 4 hp. at his elbow, with probably even more mechanical power per capita to come.

The first serious efforts to improve on the old method of making molds by the use of hand ramming only resulted in the construction of a number of different types of machines. The hydraulic power for molding purposes, commonly used in European countries, has evidently but a limited application in America. Though cheaper in installment and running cost, the hydraulic system has been discarded in America in favor of pneumatic power, because of the greater flexibility and speed of production made possible by use of the latter method.

Air Leakages Impede Molding Operations

It is unfortunate, though, that leakages, which never could be tolerated in a liquid pipe line, are a daily occurrence in almost every foundry having an air compressor. Air is free, and thus it is not considered of much importance that losses occur almost every minute of the working day. It is strange that such a universal slackness is shown in this connection, as it is common experience that the pressure drops below the required minimum. The writer does not remember having spoken to any foundryman who did not admit having an insufficient surplus of compressed air in his plant.

While the molding machine originally was designed for handling molds on a production basis, the sorely felt need for mechanical devices which could assist the highly paid skilled molder to increase production has resulted in at least two types of useful equipment: the jolting machine for jobbing work and the sandslinger.

Forecasts Further Improvement in Molding Machines

In recent years the design of molding machines for production work has shown few changes, seemingly indicating that this type of equipment has reached full development. It is more likely, however, that the next few years will show greater changes in molding methods than have been witnessed in any previous corresponding period. First, consider the smallest type of work, as represented in malleable castings. The molds are almost exclusively made on the power-jolt-squeeze hand rollover and hand, pattern draw machines. These machines are fast, provided the operator is a strong and speedy workman. There is really no reason why machines could not be designed so that the molder would do nothing but move levers, set cores and lift the finished and closed mold to the floor or place it on a conveyor. With all the engineering attention this problem at present receives in America, it is but a question of time when it will be solved.

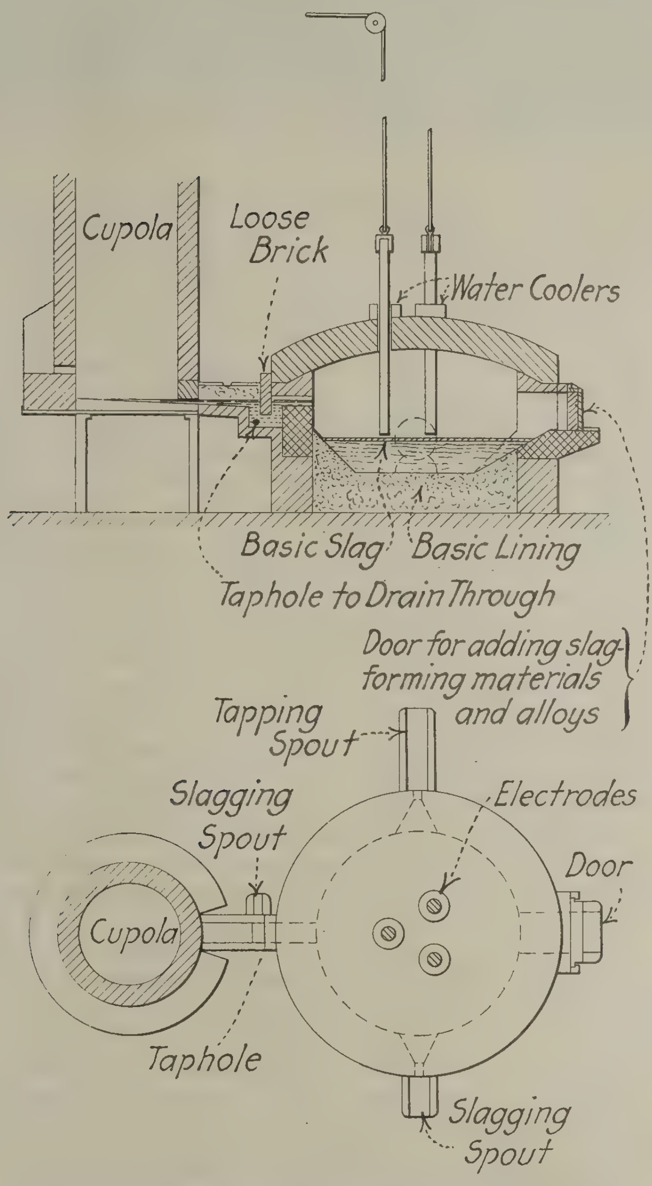
The type of work requiring a flask for each mold is a different proposition. The sandslinger solves the problem to a certain extent, as almost any mold can be rammed with the aid of this machine. It can do no more, however. Also, if it is possible to ram a mold on a jolting machine, that method will in most cases be the faster, and jolting is the best known way of making a uniformly rammed mold.

Now, as to the present position of the jolt machine for jobbing work: Generally speaking, the largest work is made on a plain jolt table, while at least one concern builds a rollover pattern draw machine suitable for medium-sized and even fairly heavy work. There seems to be room for further progress. The ideal molding machine for the jobbing foundry will probably be a jolt machine with mechanical devices to ram the upper part of the flask at the same time that the lower section is packed by jolting, the machine then rolling the flask over and drawing the pattern from the mold.

Nothing is impossible in the engineering world so long as the laws of nature are followed. There is no reason why the vast sums of money available for research work in the United States industries should not be partly utilized to devise the construction of a machine for the jobbing foundry which—utilizing the present flask and pattern equipment—will ram the mold, draw the pattern and assemble the parts, either on the machine or on the floor. When the possibility of further progress is admitted, real advance is but a question of time.

American Foundry Superior in Materials-Handling Methods

FOREIGN foundrymen witnessing at close quarters the American foundry industry in the midst of an unprecedented development cannot help but notice the many different ways material is handled in the various foundry departments. It is a well known fact, that often more than 100 times the weight of the finished casting must be handled in the routine of the work. One of the most striking differences between American and European foundry practice is the way American foundrymen have tackled the problem of relieving the workman from the backbreaking labor of handling sand and other materials, as well as the problem of intraplant transportation of castings. The future economic position of the foundry industry will mainly depend on the further developments in this field. The ways the problems may be solved seem to be legion. While a certain uniformity is noticeable in molding machine construction and uses, a pronounced individuality is plainly seen in the manner various firms have tackled their problems in handling foundry materials, perhaps naturally so. Conditions in various plants are so different. Again, firms are generally large enough to afford to spend the money for the brains, labor and materials required for the development of new methods.



An Electrically Heated Stationary Forehearth Connected with a Cupola by a Self-Slagging Spout. The metal runs in a constant stream through the spout, where it gets rid of acid slags, and enters the basic-lined forehearth. The purpose of the forehearth is to superheat, deoxidize and desulphurize the metal

American "Open-Door" Policy Contrasted with European Secrecy

A suggestion that inventors should take a 10-year vacation was recently made. People should be given time to catch up with progress. Any foundryman visiting half a hundred American foundries knows that there is a real reason for such a proposal, even though it is not practicable. The multitude of improvements and devices at present flooding American foundries paint a picture of the riotous, rapid onward rush of the current of progress. In spite of the broadminded policy of the open door almost universally adopted among American foundrymen, it has not been possible for the various leaders to absorb and utilize in their own plants the many different details developed in the plants of their colleagues. People in Europe have—to their own detriment—partly believed in secrecy. The lesson taught during the Detroit convention will go far to change the views of the European foundrymen in this respect. "Why should I not let a competitor visit my plant? If I do not learn from him more than he gets from me, I am to blame." This was one of the many sensible remarks heard in America.

Molding Sand—The Key to Closer Limits in Castings

A FEW words about molding sands—by far the most important of all foundry materials—may not be amiss. America has an enviable resource in a great variety of splendid molding and coremaking sands. The strongly bonded, yet fairly open, sand which is available has made it possible to subject the molds to far rougher handling than generally would be possible in Europe. This is highly important for the continuous foundry with its multitude of conveyor systems. The chemists have, however, through their analytical investigations made synthetic production a paying proposition in many fields. Apart from the fact that the natural resources of molding sand some day will be exhausted, there appears to be an alluring fascination in the problem of repeating the work of nature and improving upon it, by building in the factory a sand with ideal properties. The writer has seen charts of daily tests from a production foundry running entirely on a molding material built up of pure silica sand and high-grade fire clay. Although silica sand seems to be the natural basic material, it is by no means established that clay is the only good bonding substance.

Work in this field has only begun, and it is impossible to say what results research workers may achieve within the next few years. Just consider the problem of the sand burning on, or at least adhering to, the casting when removed from the mold. Cement is sometimes used to coat the mold. A titanium-nitrogen compound has been found that gives even steel castings a clean surface in green sand molds. In spite of the very difficult nature of the task, the writer believes that some day castings will uniformly strip clean from the mold, and that much heavier castings than it is now possible to make will be poured in molds that have not been subjected to a drying process.

Today instruments measuring the moisture of the sand pile are in daily use, while bond and permeability are checked by constant use of standard equipment. Presently we shall witness means of automatically adjusting the moisture and permeability of the sand as it passes the treating apparatus in the uninterrupted flow of operations.

The evolution of mass production has produced revolutionary changes in the foundry industry. Exacting demands, previously unheard of and thought impossible, are today met with in contract specifications.

Sees New Market for Malleable Castings

"QUALITY is remembered long after price is forgotten." "Quality" may be a present slogan of American industry. The trouble with the foundry industry is that it is often difficult to find terms in which to make the problem of quality clear to the buyer. This is because of the complexity of the problem, particularly so in the case of cast iron.

In the malleable cast iron field the pioneer work started by Seth Boyden has been continued uninterruptedly, with the result that American black heart malleable now is universally recognized as a very superior product. The untiring research work in this field has developed the air furnace, stoked with pulverized coal as standard practice. While pulverized fuel seems to be ideal for this class of work, it is a pity that so much heat is wasted in the stack. Again, the continuous pouring, such a desirable feature in the modern production foundry, is an impossibility under the present common melting practice. A furnace was built in Germany some time ago, based on the principle of utilizing the waste gases from the air furnace, actually superimposing a cupola on the air furnace. Unfortunately the inventors of this furnace seem to have overlooked the danger of melting with oil, as they did, having the flames playing directly over the hot iron before melting, decomposing the water vapors in the flame and thus oxidizing the metal. It is by no means unlikely that the furnace which will come to stay in the malleable plant will be a continuous melting unit, using pulverized fuel or even carbon monoxide gas.

As to the application of malleable cast iron in engineering construction, changes are evident. While smaller castings in many cases are being displaced by pressed steel or drop forgings, a new market is about to be opened, as the carbon content is gradually being lowered, now at times touching 2 per cent. Such a metal can be poured in the heaviest sections, and while malleable castings now sometimes weigh hundreds of pounds, this tendency to encroach on the field of steel castings may continue. This does not mean that such a tough metal as is demanded in heavy work will be wanted in smaller pieces, where easy machineability is of primary importance.

In the cast iron field, the quality of the available raw materials constitutes a story of constant retrogression. Beginning with the cold blast charcoal furnace, one proceeds to the coke furnace, to hot blast, increased rapidity of ore reduction, and finally a heavy addition of scrap to the blast furnace burden. While the discussion as to scrap in the furnace burden is still blazing hot between producer and consumer of foundry pig iron, the writer may state that he almost universally encountered foundrymen strongly criticizing the unreliable quality of ordinary low-priced virgin metal. One firm purchased 1200 tons of pig iron, but discovered that it was impossible to add more than 10 per cent of this iron to the charge, if trouble were to be avoided. The present situation is no doubt transient.

The greatest difficulty in the case of cast iron is that the price is the most important item—in many cases the only justification for the adoption of this material in constructional parts. The improvement in quality that has to come must be achieved in harmony with the demand for relatively cheap castings. In spite of the extensive metallurgical control common to large American plants, the greatest headway in quality has probably been made in Europe. While the pouring in heated molds, for a while strongly advertised in Germany, may not become practice in America, the all-steel charge in the cupola has been successfully tried in American plants. The study of graphite formation is bound to lead to methods resulting in the most favorable fractures, partly by addition of special alloys, while the amount and form of the combined carbon will be controlled to suit varying demands.

Proposes Electric Forehearth for Cupola

UNFORTUNATELY the cupola is not suited for the production of the highest grades of iron castings. The desirable maximum melting temperatures cannot be attained. A close control of the carbon content is very difficult, and the lower limits at times desired for this element are beyond reach. Again, the sulphur pick-up may be objectionable. Worst of all, the metal is easily oxidized. Hence the resort to air furnace practice or the electric furnace for castings of the highest quality, as for instance in the case of chilled rolls.

Duplexing and even triplexing processes are used. The trouble is that the cost of installing the electric furnace often is prohibitive, and the intermittent application of the electric current is a costly item. The writer recently worked out an idea calling for the combined use of the cupola and an electrically heated stationary forehearth, which—so far as he knows—is new and original.

As shown in the sketch, a self-slagging spout from the cupola is connected with a stationary electrically heated forehearth. The metal is melted as hot as usual in the cupola, runs in a constant stream over the spout, where it gets rid of the acid slags, and enters the basic-lined forehearth, where a basic slag covers the bath. As but a small amount of extra heat need be added, the electric energy may be applied all the time, but a relatively limited amount of current is consumed. The purpose of such a forehearth is threefold: to superheat, to deoxidize and to desulphurize the metal. If small castings are made, the forehearth may be of relatively limited capacity. For large castings the power load will increase, because of the larger cooling surface of the forehearth, the depth of the bath not exceeding 6 in. The metal is tapped when the required quantity of metal has accumulated. The construction details should be such as to allow for the addition of slag-forming materials, also to make it possible to drain the fluid slag at intervals. As alternating current of 110 volts tension is rather common in America, it may, in many cases, be possible to avoid the use of specially constructed melting transformers, although it must be remembered that the application of the current in the furnace at times subjects the transformers to rough treatment.

Should any American foundryman be interested in the above proposition, the writer would appreciate information about the results that may be derived.

Foundries Should Talk the Same Cost Language

THE foundry industry suffers as a result of rapid plant expansion during the war—hence too keen competition, with the natural destructive consequences. While probably all will agree that every order ought to leave a profit, the trouble is that the method of finding production costs has not been standardized. An American association sent a questionnaire to a number of foundries specifying certain castings, giving weights and asking the prices to be paid for all types of labor, for raw materials, etc. All the firms were requested to do was to insert the figures from their respective cost systems. The results showed differences of almost 100 per cent. No wonder the buyer at times is puzzled over the greatly varying quotations! Before real progress can be made, the same language must be talked. The system of cost-finding must be standardized. Presently this problem will be solved through cooperative efforts. "I am perfectly willing to let a competitor see my cost cards—not selling prices. Should I refuse to do so, he is entitled to think that I am not playing fair." This remark—passed by a cost accountant in a steel foundry—will be brought to the attention of foundrymen in Europe.

Over-Expansion in Steel Foundries

Consumption of Castings Has Increased 37 Per Cent Since 1913, But Active Capacity Dropped from 75 to 55 Per Cent During Same Period

BY WILLIAM J. CORBETT*

THERE are 293 individual plants in the United States in which steel castings are manufactured, and these are operated by 267 companies. The total practical capacity for the manufacture of steel castings in the United States is 198,863 net tons of good castings per month, or 2,386,356 net tons (2,130,000 gross tons) of good castings per year. Of this total capacity approximately 9 per cent belongs to companies that manufacture steel castings exclusively for their own use. In addition there are others operating steel foundries all of whose castings are not sold direct to consumers, such companies as those engaged in the manufacture of heavy machinery, and also some of the large steel mills. However, the capacity of foundries operated as separate departments of large corporations is sometimes greater than necessary for their own use, and consequently the surplus is sold in competition with foundries specializing only in the manufacture of steel castings.

Total Sales of Steel Castings Increasing Steadily

The upward trend in the production of steel castings has been quite marked. Users of metal products recognize the strides that have been made in the founding art. The quality of the products made in cast steel has improved, with consequent benefits to their users. While these accomplishments have brought increased recognition of the economy and usefulness of steel castings—and they should be more and more effectual in the future in the way of increasing consumption—the capacity of the industry has never been utilized to its full extent—in fact, the increase in capacity has been greater than the increase in sales.

Fig. 1 is constructed from data (in gross tons) published annually by the American Iron and Steel Institute. No data for the year 1927 are yet available from this source, but it can be estimated, as shown dotted, that the total for last year was below that in 1926. The trend since 1910 is indicated by the straight dotted line, determined in accordance with the customary method of calculating the secular trend of a series of statistical data. The average increase as shown by the straight line of secular trend is about 50 per cent since 1910; that is, one and one-half times as much tonnage of cast steel products was used last year as in 1910. This rate of increase will probably continue for the reasons mentioned above. Yet despite the rapid growth in the consumption of steel castings as depicted in Fig. 1, the capacity of the steel casting industry has increased even more rapidly. Existing facilities have been made more effective, and much new capacity was created during and since the war. If the total production of steel castings in 1927 was 1,320,000 net tons (estimated), only about 55 per cent of the capacity was utilized. Therefore, further increase in steel foundry capacity would be economically unjustified until there is a decided increase in the consumption of the cast steel products.

Acid and Basic Steel on a Par

The trend of production of basic open-hearth steel castings made in foundries has been upward. The output, as indicated by the line of secular trend figured from data of The American Iron and Steel Institute, is about 19 per cent greater at present than in 1910. During the last few years the consumption of open-hearth steel castings, both basic and acid, has been somewhat retarded by the reduced purchases of new railroad equipment, which absorbs a considerable proportion of the total output.

Annual production of steel castings made in foundries using acid open-hearth furnaces are strikingly parallel to those for basic open-hearth castings, and nearly equal in quantity. On the whole, the products of foundries using acid open-hearth furnaces are considered to be general miscellaneous castings, as distinguished from basic open-hearth steel castings which are largely railroad specialty castings.

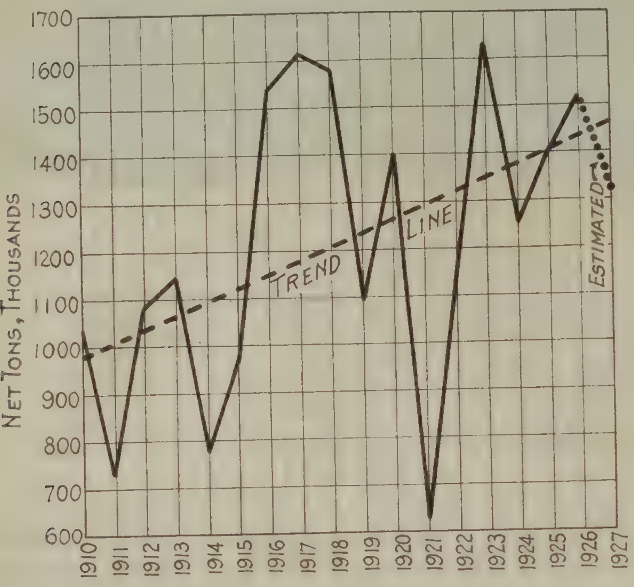
The output of steel castings made by converters, crucibles and electric furnaces consists of small and medium sized carbon and alloy steel castings. These furnaces are chiefly small units and together are responsible for less than one-third of the output in weight. While converter castings had a peak production of 180,000 net tons in 1918, there has been a decrease to 64,000 net tons in 1926. This decline is due entirely to the supplanting of converters by electric furnaces and small open hearth furnaces. Under some conditions converters are slightly more costly for making steel, and severe competition compelled the steel foundries to replace them if there was a probability of reducing costs by so doing. This condition has not existed in all converter installations, since it depends on economic factors that vary.

---

*Secretary-Manager, Steel Founders' Society of America, Pittsburgh.

Electric Steel Replacing Converter Steel

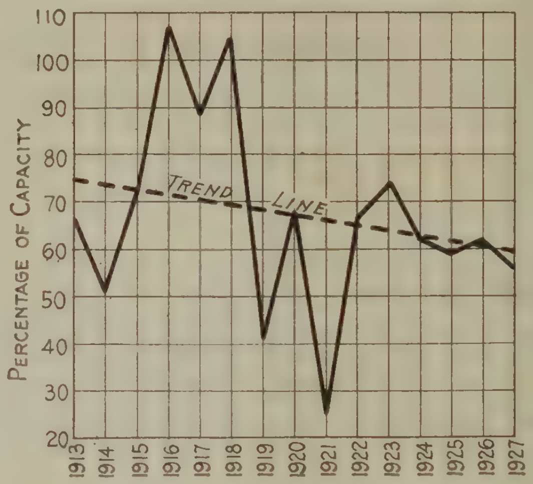
A rapid and almost continuous increase in the production of electric steel castings has been common knowledge. In 1914 it amounted to about 10,000 tons; in 1926 it was over 350,000. The most significant increase took place at the beginning of the war when many foundries were prompted to install electric furnaces. Since then the output of foundries operating electric furnaces has more than offset the decline in converter and crucible steel castings. As noted above, the electric furnace has to some extent displaced the converter because, when certain conditions exist in a certain locality at a certain time, the cost of making steel in an electric furnace is less than its cost when the converter is used. However, the important fact must be recognized that the cost of the steel in castings is a relatively small part (approximately 20 per cent) of the total value of the castings and their total cost of production. Therefore, differences in the cost of making steel in different types of furnaces exert only a minor influence on the total cost of manufacturing steel castings.



Total Annual Production in Net Tons of Steel Castings in United States. Data from American Iron and Steel Institute, with 1927 estimated

The rapid increase in electric steel castings has also been due to the fact that products previously made of other materials and assemblies of other materials have been converted into steel castings. Perhaps these new uses for steel castings have had a greater effect in augmenting the output of the smaller castings, such as manufactured in foundries operating electric furnaces, than they have influenced the tonnage of the larger castings manufactured in open hearth furnaces. It is probable that the increase in electric steel castings may not continue at the same rate as would be indicated by the trend lines, unless new uses are created for these castings. The present number of electric furnaces in operation does not justify a further increase in the capacity of this branch of the industry. This is obvious when reference is made to Fig. 2. The condition indicated therein applies to the entire steel casting industry. The rapid increase in number of electric furnaces put into operation is responsible for much of the excess capacity.

The diagram Fig. 2 is of most importance. It shows the relation of the capacity to demand for steel castings. The statistics used were taken from the publications of the Department of Commerce, and the trend as shown by the straight line was computed in the regular way. During the war a great demand for steel castings led to an increase of facilities for producing them, but at no time since the war have these facilities reached more than 74 per cent utilization. Moreover, these production facilities have been increasing since that time, causing the percentage of their utilization to gradually decrease, as shown by the straight dotted line in Fig. 2. This has occurred in spite of the increase in total consumption of steel castings shown in Fig. 1. In 1920 the demand for steel castings was close to 70 per cent of the capacity, and while the trend of consumption has increased 16 per cent since then, the capacity of the industry has grown to such an extent that in 1927 it operated at less than 60 per cent of capacity. During the latter part of last year considerably less than 50 per cent of the capacity of the steel casting industry was utilized.



Total Bookings of Steel Castings in Percentage of Total Capacity. Data from Department of Commerce

It is to be expected that the use of steel castings will continue to increase and perhaps at a greater rate than the rate of increase in population. However, it appears that in the public interest further expansion in the facilities for manufacturing steel castings should be delayed until a greater percentage of the present capacity of the steel foundries can be utilized to meet the needs of consumers.

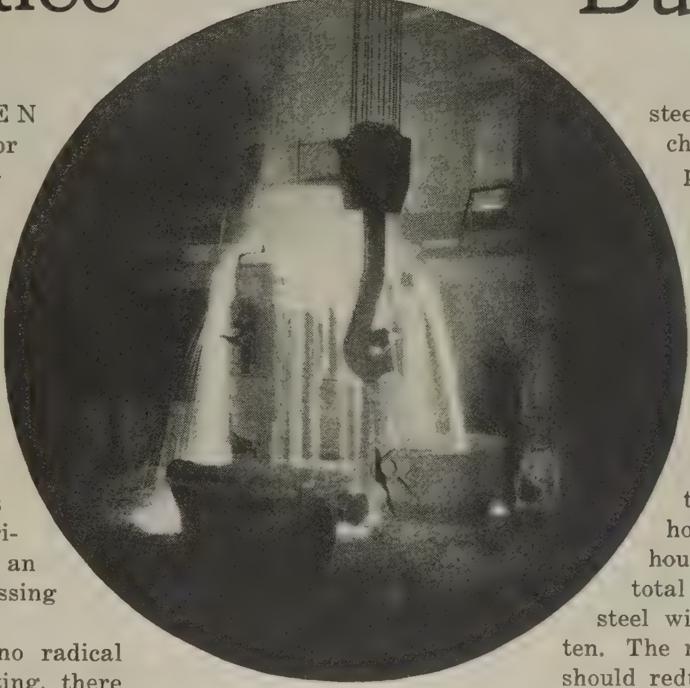
Suspension of German Mills Would Affect 200,000 Men

Hamburg, Germany, Dec. 20.—The threatened suspension of German steel mills as a result of the controversy over the proper time limit for establishment of an 8-hr. day, should not be very far-reaching. It is rather generally conceded that some compromise settlement will be reached, but should a lockout actually occur, the number of men being laid off should not be more than about 200,000.

As the blast furnaces have the 8-hr. day, there is no intention of suspending operations in this field, unless closing the steel mills forced a general curtailment of production. The threatened suspension also would not affect mills rolling plates, sheets, hoops, bands and pipe and tubes. It would apply to the plants producing steel ingots, semi-finished material, bars and shapes, and the total employed by this branch of the industry is about 200,000.

The controversy of the steel mills with the Government has affected importation, and a considerable tonnage of steel is reported to have been placed by German importers with mills in France, Belgium, Luxemburg and Czechoslovakia.

Changes in Open-Hearth Design and Practice During 1927



BY WILLIAM J. PRIESTLEY*

1927 HAS BEEN notable for an ever-increasing demand for better steel and lower prices. To meet these conditions, steel operators during the past year have analyzed more carefully than ever before the chemistry of their melting practice and sought means to reduce their costs without sacrificing the quality of their steel. Members of the various technical engineering societies have taken an active interest in discussing open-hearth problems.

While there have been no radical changes in open-hearth melting, there has been a liberal exchange of ideas of both operation and furnace design. Ideas and opinions have been wide and varied on every subject discussed, yet it is evident that steel men have come closer in accord on certain of the more important subjects.

It would be improper and impossible to attempt to review in this short article any great number of the topics discussed, but it may be of interest to single out a few of the things in which some degree of progress and development appears to have taken place this past year.

Research in Physics of Steel

A NOTABLE research program was laid out during the past year by the Bureau of Mines, the Carnegie Institute and a number of steel companies cooperating with these two institutions to make a systematic study of the physical chemistry of steel making. The field to be covered is broad and will take at least five years to complete.

During the past year six men under the direction of an advisory board published their findings on the subject of solubility of iron oxide in iron. They propose to take up next the effect of iron oxide and other non-metallics in commercial steel and the means necessary to eliminate these harmful impurities. This group of investigators reported that molten iron is saturated at 1600 deg. C. when it contains 0.30 per cent oxygen, and at 1700 deg. C. when it contains 0.45 per cent oxygen. When applied to practical operations it was pointed out that the iron oxide content of open-hearth slag should be kept as low as possible in order to make the best steel.

Advances in Furnace Design

Pre-Heaters for Air

WITH the view of shortening the time of melting charges, a well known company has presented to open-hearth operators during the past year a device for pre-heating the air before it enters the regenerator, utilizing heat in the waste gas going into the checkers.

The heaters are made with plates of non-oxidizing chrome steel. Steel containing 15 per cent chromium will withstand temperatures up to 1400 deg. Fahr.; steel containing 28 per cent chromium will withstand temperatures as great as 2100 deg. Fahr. without oxidizing. The advocates of this pre-heating device maintain that air entering the furnace from the slag pocket may reach a temperature of 2150 deg. Fahr. instead of 1900. It is said that this higher temperature of the air reduces the melting time from seven hours to six hours. With three hours taken for refining, the total time of making a heat of steel will be nine hours instead of ten. The net gain is 10 per cent and should reduce costs about 25c. per ton of ingot.

During the past year new installations of flat suspended roofs have been reported. The results obtained on the original installations were promising as compared with the commonly used sprung arched roof. Reports have been received of this new type of roof lasting for more than 400 heats.

Advocates of this type of construction think that slight modifications in the height of the roof above the fore plate may produce a faster working furnace and changes in the thickness of the roof tile may give a greater life. They claim 500 heats from a single roof may be possible.

Sloping Back Wall

The sloping back wall was adopted by many furnace men who rebuilt their furnaces during the past year. This feature entirely eliminates back wall repairs and reduces the cost of maintenance. It is nothing more than a continuation of the hearth sloping upward and backward until it reaches the rear skewback of the furnace. The slope of this extended hearth is gentle enough so as to hold the loose dolomite added from time to time for patching. The principal advantage of the sloping back wall is the elimination of the time lost in repairing back walls of brick. This increases the tonnage melted during the life of the furnace.

Isley Furnace

Another innovation pertaining to open-hearth design has received wide discussion during the past year. The Isley furnace utilizes a venturi tube placed vertically at each end of the furnace instead of the stack. There is a low pressure fan at the base of each tube. One fan exhausts the outgoing gases while the other fan running simultaneonsly furnishes a predetermined amount of air to support complete combustion.

The length of the tubes and flues may be varied so as to get the waste gas temperature as low as possible. Cases are recorded where this is as low as 400 deg. Fahr. The flues between the venturi tube and the checkers serve as recuperators and pre-heat the ingoing air on reversal of the furnace.

This type of furnace control is said to save fuel, give greater tonnage and longer life to the furnace.

---

*Vice-president, Electro Metallurgical Sales Corporation, 30 East Forty-second Street, New York.

Several installations are in operation and more comprehensive data may be published later.

Future Trends in Furnace Design

The future trend of open-hearth design will be toward larger furnaces where greater tonnages will decrease overhead operating expense.

New refractories for furnace lining must be found that will withstand higher melting temperatures and quicker melting.

Ingenuity will have to work out new ways for combining and utilizing to better advantage our present sources of heat.

Furnaces must be constructed to obtain better control over atmospheric conditions for melting and refining. All these developments must come to keep pace with the steady and increasing demand for steel in its many new uses.

Production of Acid Steel

WITH the decreased production of ordnance steel we do not hear as much today about acid steel as we did several years ago. It is for this reason that it might be interesting to review here some of the things that have been said about this type of steel recently.

By far the greatest number of acid open-hearth furnaces in operation are used for making steel castings, but there are still some steel men who prefer acid open-hearth steel to basic open-hearth steel for the peculiar properties obtained for certain products.

Experience of a Cable Maker

This subject was recently brought to the attention of engineers at a discussion of the different kinds of steel used for modern long-span bridges. A well known company that specializes in the manufacture of wire and wire rope, states that after sixty years' experience it still prefers acid steel for suspension bridge cable. This company still believes in purchasing the best selected raw materials for furnace charges. It uses the purest low phosphorus and sulphur pig iron. It uses only its own selected scrap and melts the heat with low-sulphur fuel oil. It claims that acid steel properly made contains fewer non-metallic impurities, has less occluded gases, and has higher tensile strength and elastic limit than best basic steel made in its own plant. It also believes that acid steel has greater resistance to fatigue. No comparison was made between acid open-hearth and basic electric steel of the same composition.

Residual Silicon to Be Avoided

Ideas have changed in regard to the benefits once claimed from the pick up of nascent silicon in acid open-hearth steel. It is generally conceded now that the presence of silicon in this form results in the absorption of gas in the metal, which subsequently makes the steel wild and blowy unless vigorous de-oxidizers are used in the ladle.

Residual silicon and carbon are now reduced to a low point by the use of ore. This creates a boil which agitates the molten steel and liberates gas and particles of slag which had become entrapped in the metal during the melting stage. The bath may be conditioned and finished satisfactorily by the addition of lump 50 per cent ferrosilicon and lump ferromanganese to the furnace. The use of 50 per cent ferrosilicon is more economical and produces a cleaner steel than the former practice of using sand cast silicon pig. No ladle additions of any kind are needed to produce a sound and quiet steel. The time of holding the steel in the ladle depends upon the casting conditions.

Slag Low in Iron Important

While there have been no new developments in acid open-hearth steel practice, more melters have come to realize and appreciate the importance of the slag condition and how it may be used as a guide for determining the quality of their steel.

Well made acid open-hearth steel free from iron oxide will have a slag of light pea green color, correspondingly low in iron oxide. The interior of the cold slag when broken will be solid and free from bubbles.

A black slag indicates the presence of an excessive amount of iron oxide and is a warning that harmful iron oxides have not been eliminated from the steel. Ferroalloys added to metal in this condition and coming in contact with a black slag will be rapidly oxidized and a low recovery will be obtained. Lime added to a black slag will replace the iron oxide it contains and produce a green slag of the description given above.

Because of the equilibrium or balance existing between the slag and molten steel in the acid furnace, the elimination of the iron oxide from the slag will result in the elimination of this same harmful impurity from the steel. The lime is most conveniently added in the form of broken limestone. An example of this phenomenon may be seen by comparing slags to which different amounts of limestone have been added. A typical slag to which 10 lb. of limestone per ton of metal has been added showed

SiO_2	FeO	MnO	CaO
53.96	23.40	11.82	8.72

A slag to which 20 lb. of limestone per ton has been added showed

SiO_2	FeO	MnO	CaO
56.87	7.73	14.50	14.20

The steel from which the latter slag was taken did not require the addition of aluminum to the ladle. It lay quiet in the molds and passed satisfactory physicals.

High-Manganese Pig in Basic Open-Hearth

THE physical and chemical composition of pig iron best suited for basic open-hearth operation has been discussed for many years. While dissenting opinions will always rightfully exist for different practices, it appears to be generally agreed that pig iron with 1.5 to 2 per cent manganese speeds up the furnace and produces better steel than when this element is lower.

Silicon seems to be most desirable between 1 per cent and 1.25 per cent for a cold metal charge and as low as 0.80 per cent for a hot metal charge.

The carbon content has also been discussed, but steel men appear to be as far apart as ever on this subject.

It has been plainly demonstrated in many instances during the past year that alloys of manganese and silicon used together in proper amounts give better results than when used singly or not at all. It has also been shown that clean ferroalloys, free from oxides and impurities, are essential for making clean steel.

Rigid Testing Has Reacted Favorably

TALKING recently with an experienced steel man, he made the statement that while the present multitudinous tests applied to steel by modern metallurgical inspectors are hard on open-hearth melters, they have really been a blessing in disguise. They have resulted in raising the standard of melting practice and better steel is made today than ever before. Open-hearth tonnage operators are sometimes asked for quality which in years gone by would have been furnished by a specialist making high grade acid open-hearth or basic electric steel. Yet there is no doubt that much steel is rejected as the result of improper interpretation of the tests applied. If the inspector had better knowledge of steel melting and the use for which the steel is intended, it would be beneficial to all concerned.

Use of sulphur prints has decreased because they could not always be properly interpreted. Deep etching with different kinds of acids gives a better idea of the nature of the impurities in the metal, but this test may be abused if standardization of acids, temperature and immersion is not followed.

There was a time when micrographs were looked upon by practical steel men as laboratory curiosities, but many grades of forging steel are now sold subject to microscopic tests in both the etched and unetched condition. Deep etching reveals unsoundness and segregation and direction of the flow of metal. The microscope will reveal grain size and will differentiate between iron oxide, silicates and manganese sulphide. Many instances have come to the writer's attention during the past year where photomicrographs have made it possible for melters to improve the quality of their steel by changing open-hearth melting practice.

More Alloy Steel Consumed

WHILE the total steel production in the year 1927 has been below the figures of 1926 and the total amount of alloy steel going into automotive parts in 1927 was less than 1926 on account of curtailed automobile production, the alloy steel tonnage going into other lines of industry has been greater than ever before. Thus the use of alloy steel is becoming more diversified. The trend in modern engineering is to decrease weight and use higher strength materials. This can only be accomplished through the use of alloy steel.

There has been a notable growth in the use of low carbon manganese steel for both rolled products and castings. Steel of this description has been made most satisfactorily in the basic open hearth by the use of low-carbon ferromanganese and silicomanganese.

For locomotive castings where reduced weights and greater ductility are essential, zirconium treated steel has found favor.

Small percentages of chromium are added to steel castings of large sections for the purpose of obtaining closer grain and better physical properties. This practice is growing. Many buyers are again using chrome-vanadium steel after unsuccessful results when using silicomanganese steel as a substitute.

During the past year the amount of low-carbon ferrochrome used in various grades of open-hearth steel has increased 30 per cent. While nearly all stainless steel and rustless iron is made in electric furnaces, satisfactory steel with as high as 25 per cent chromium was made in an acid open hearth. This steel was used for liners and wedge bars for ball mills, jaw plates and toggle seats for jaw crushers, breast plates for rolling mills, rings and pushers for cement mills, rolls for small roll crushers, and valves and valve parts. By de-oxidizing the steel bath and conditioning the slag properly, the ferrochrome, pre-heated red hot, was added to the bath without excessive loss.

Unprofitable Year in Cast Iron Pipe

Centrifugal Output Shows Large Increase, but Total Production Was Probably Under 1926—Price Decline Unusual Feature

ALTHOUGH production of cast iron gas and water pipe in the past year is estimated to have compared favorably with the total output of 1926, possibly showing a slight decrease, the year was rather unprofitable, prices having declined more than 25 per cent. Output of cast iron pipe had been steadily climbing since the war years. In 1921 the total production of gas and water pipe was 564,138 net tons, in 1922 the total was 926,577 tons, in 1923 the million-ton mark was passed with 1,134,059 tons, in 1924 the output was 1,365,272 tons, in 1925 it was 1,414,252 tons, and in 1926, 1,534,278 tons.

A feature of the 1927 production was the growing interest of consumers in centrifugally cast pipe, output of which was larger than in any previous year. The centrifugal pipe shops were operated at a high rate, and competition among the few producers of this product was severe. The total production of pipe made under the De Lavaud and sand spun processes has been estimated at close to 400,000 net tons, the sand spun shops contributing about 25 per cent of this total. This compares with an estimated output of centrifugal pipe in 1926 of 200,000 to 225,000 net tons. Much of this increase is accounted for by the fact that the American Cast Iron Pipe Co., Birmingham, and R. D. Wood & Co., Florence, N. J., have both been active producers, whereas they contributed but little to the total output in 1926.

European pipe was not much of a factor in the East after the first quarter, although both Belgian and French pipe provided fairly active competition on the Pacific Coast for many months. However, the total brought in is estimated at about 80,000 tons, a few thousand tons less than in 1926, when the total for the 12 months was 83,873 gross tons.

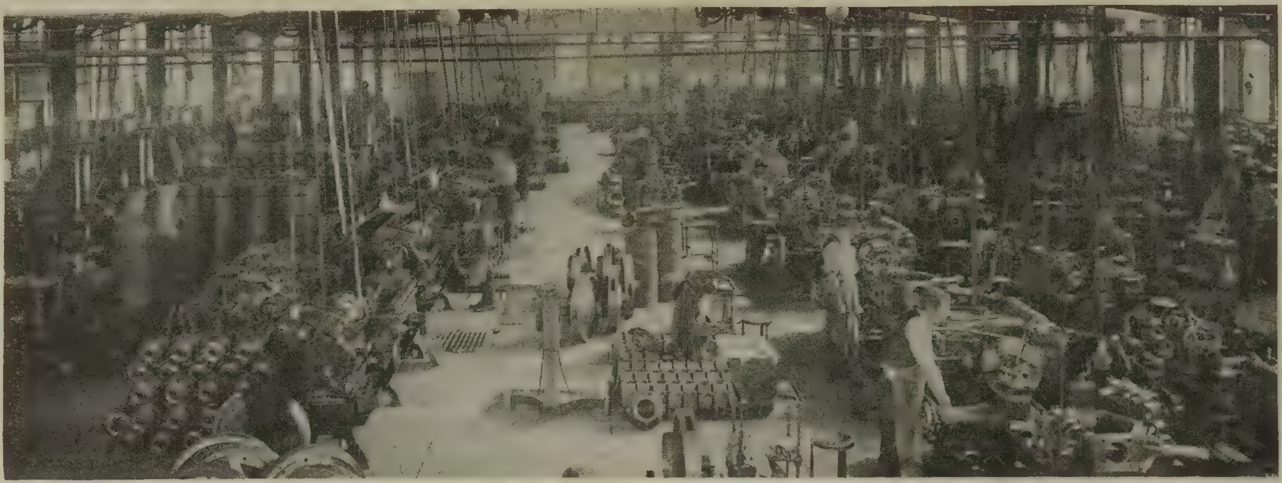
The decline of prices, particularly their rapid descent in the latter part of the year, was so great as to attract considerable attention in other branches of the iron and steel industry. From a Birmingham base of about $37 per net ton in January, the market dropped $10 to $11 per ton to about $26 in early October.

This downward movement of prices was not entirely without reaction. In the early spring some firmness developed on the smaller sizes of pipe and there was a slight tendency to advance, but it was of short duration, and as Southern makers began to be more active competitors for large tonnage business in the North, the market began to sag. By the second half of the year efforts to maintain a separate Northern base for pipe proved futile, and the Birmingham base price ruled in sales, not only in the South and at Chicago, but also in the New York and New England markets.

Municipal purchasing of pipe, uusally an important factor, failed to develop to the expected proportions. Buying by privately owned utilities, however, provided the greater part of the year's business in the East. Throughout the year, municipalities on the Pacific Coast were fairly active buyers of small lots, and one of the largest purchasers was Los Angeles, which closed on more than 15,000 tons of pipe, about one-third of which went to French and Belgian sellers. In the second half, the Pacific States Cast Iron Pipe Co., Provo, Utah, organized in 1926, became an active factor in Western business and is estimated to have booked as much as 50 per cent of the late fall orders.

As in 1926, Detroit was the outstanding municipal purchaser of pipe, closing on more than 25,000 tons during the year, part of which went to the importer of French pipe. In the Detroit awards, as in the case of other cities, centrifugally cast pipe represented a larger portion than in the past. New York was also a large buyer of pipe, closing for more than 25,000 tons in all. In the final quarter, several of the large privately owned utilities placed some sizable orders for gas and water pipe covering part of their 1928 requirements.

Expansion of the cast iron pipe industry was not of much consequence. The McWane Cast Iron Pipe Co., Birmingham, has been carrying forward a program of additional equipment and floor space, so that 8-in. to 12-in. pipe up to 16-ft. lengths can be cast as well as the smaller sizes. Early in the year R. D. Wood & Co. began large scale production in their centrifugal shop at Florence, N. J., and in the final quarter began alterations of this shop to increase its capacity.



Machine Tool Problems Working Out

Last Year Gave a Great Revelation of the Productivity and Accuracy of New Machines—What Shall Be Done About Used Tools and the Increase of Unpaid Engineering Service?

BY COL. FRANK A. SCOTT*

TOO erratic was the course of business in the year 1927 to be expressed in a short sentence. Indeed, the year will be notable for the irregularity of business trends. Among machine tool manufacturers and among metal workers generally certain groups have enjoyed a large volume; for example, the automotive industry. Others have had one of the poorest years in their history. Locomotive builders are in the latter class. Profits have been equally erratic and have not always rested in the hands of those concerns which enjoyed the largest volume of orders.

Usually, among the foremost concerns in any field of manufacture profit can be assumed when business reaches a given volume. This rule did not apply in 1927. Unstable price standards are chiefly responsible for this result; and this unsatisfactory price condition is due to the presence in this country of excess facilities in almost every line.

Menace of Excess Facilities

DURING the Napoleonic era England was the great industrial country of Europe and she supplied the world with manufactures of all kinds through that entire struggle. After those wars, however, when the productive power of the rest of the world again came into service, the excess of manufacturing facilities in England menaced her economic life for two decades, and caused severe crises, both industrial and political.

As the United States was the great producer of manufactured goods during the World War, American manufacturers have been the greatest sufferers since from the menace of excess facilities. In the stock market, to unload a weak security and get out at a loss is a common enough operation; but in the manufacturing world it is a sensitive point to suggest liquidation of plants and facilities for which the future holds out the certainty of a falling market. It appears to challenge every one to go out and drum up some new product or fresh opportunity, meanwhile marring the general welfare by marketing goods which are produced at too high a cost and sold on too low a basis.

Because of these excess facilities, prices during 1927 were generally established by the weakest or most desperate members of each group, thus creating a situation wherein many industries bear resemblance to a naval squadron, the best ships of which are held down to the speed of the slowest. The elimination of the slowest would automatically improve the fighting chances of the rest.

Lord Fisher, the great English naval authority, condemned ships too weak to fight and too slow to run away. If he had been analyzing American metal manufacturers he might have voiced similar condemnation against concerns too weak to maintain a profitable price policy and too strong to die with gratifying promptness.

European Production More Effective

EVIDENCE multiplies that other metal-working nations are steadily following the trend in our country toward more productive manufacturing units. The automotive production in England and on the Continent reflects a constant improvement in shop equipment; aircraft production the same. This acceptance of an advanced standard of efficiency in metal working has borne fruit in a steady, although not large, demand for the better grades of American machine tools. Japan has been a good customer, and as a result of a change in the policy of placing orders for Government requirements it appears that India may become at least an occasional buyer of American equipment. Russia placed some orders with American manufacturers and her demands may be expected to increase.

The Ford Factor in 1927

TO the future historian of American manufacturing progress the year 1927 will have a unique interest. In that year occurred the loss of Judge Gary, with all the changes which his going necessitates and implies; also the alteration of Mr. Ford's policy, which very clearly has established new standards that require readjustments, the full consequences of which cannot now be gaged; and last, but certainly not least significant, the presentation to American metal manufacturers by American machine tool producers of a most effective group of metal-working tools. At the very moment when the automotive industry sets itself for a new lap in its long race with costs, there appears to be at hand the stimulus which is most needed; for certainly no industry ever before had offered to it such an opportunity to re-tool its plants efficiently as is now presented to American manufacturers of automobiles.

---

*President Warner & Swasey Co., Cleveland.

The action of Mr. Ford, in halting production while he re-tooled his plants for the new car, raised the question as to the adaptability of equipment, first, in his own vast factories, and, second, in the plants of those competitors whose production programs may now require readjustment.

Lessons of the Cleveland Exposition

THE most evident fact at the Cleveland exposition was that the design of the newer machine tools, whether automatic or semi-automatic, aims at flexibility and applicability to the widest possible field of work.

This moves directly against the current of that opinion expressed in recent years that design movement would be toward special machines, even special automatic machines, tooled for particular operations.

It is still too early to claim that the disadvantage of special machines, and particularly special automatic machines in the automotive plants, has been proved. But developments this year indicate that weaknesses of this type of equipment are now recognized even by those who were its strong advocates. The primary advantage of special equipment designed and tooled for a particular operation on one piece needs no comment. If the world could accept the status quo in production, special equipment would hold the stage. The fly in the ointment is that in every competitor's field a change of design by one producer forces similar action upon others, and if highly specialized equipment is being used it proves too inflexible for quick and advantageous readjustment. The expenditure of both time and money is multiplied to perhaps a dangerous degree.

Users Helped in New Development

THERE have been recurring statements, since the war, that machine tool manufacturers were redesigning their products or producing new types of increasingly effective pattern. Not even the leaders of the industry, however, grasped the full effect and meaning of these statements until the doors swung open on the Exposition at Cleveland in September. Then there were seen, many of them for the first time, machine tools of such productivity and accuracy as had never been beheld before. They were the fruitage of sixty years of American mechanical genius, thought and research; sixty years of American workmanship and American aptitude to utilize the best that is available in productive facilities. It did not require the "seeing eye" to recognize the dawn of a new era in metal working.

Users as well as makers of these machines have contributed to their development and are entitled to credit for the splendid result. The greatest acceleration toward improved design came from the automotive industry, intensified by pressure of competition in every field after the war. No other nation has had just the same experience, although England and Germany have felt similar impulses and experienced the same beneficial results in lesser degree.

Thousands of owners and executives of the great metal-working plants of our country, as well as of foreign countries, accepted the opportunity to study this equipment.

The points of origin of the machines on exhibition, as well as the home cities of the visitors, all of whom were registered, emphasized another significant change which has occurred so gradually as almost to escape notice. It is the shift westward of the center of machine tool production and market.

Twenty years ago the market probably would have centered on a line from Buffalo to Pittsburgh; now it undoubtedly would center on a line running south or southwesterly from Detroit. The oil industry in the Southwest has introduced a great number of large and effective machine tools into that section, and there are now many considerable plants producing a wide variety of metal articles in the district north of St. Louis and between the Mississippi River and the Rocky Mountains.

Thousands of Tools in the Discard

REPERCUSSIONS from the Cleveland Exposition were of many sorts. The rise in volume of orders was natural because of those withheld awaiting inspection of machines on exhibition. The psychological effect on the larger machine tool users was impressive. Personal statements and numberless letters written to machine tool producers after the exposition indicate that the thinking in the American metal-working groups is hardening around these conclusions:

The expansion of metal-working plants during the war left a large legacy of excess space and plant equipment. Optimism has sustained the hope that peacetime volume might grow up to these facilities. This has not happened. There are thousands of machine tools in American factories which now are rendered ob-

COLONEL SCOTT'S broad acquaintance with the metal-working industries, which made him chairman of the War Industries Board in 1917, *enables him to speak with unusual authority on the prospects for machine tool builders. He notes that the cost of design, manufacture, sale and servicing of the modern machine tool has risen continuously.*

On account of excess manufacturing capacity dating back to war times, the selling price has been established by the weaker producers; the result is the lowest earnings in several years. In fact, profits are so meager that rising prices for machine tools seem inevitable in 1928.

American manufacturers generally were surprised at the wealth of opportunity displayed to them at the Cleveland Machine Tool Exposition. Low-cost production in many lines, with corresponding effects on the balance sheet, will come to those who first take advantage of the new tools, unrivalled in productivity and accuracy, yet flexible enough to conform to those necessary changes in output found desirable from time to time.

solete by new developments. They never can profitably be employed again. They are scrap. Conservatism or some other restraining influence may retard their disappearance into the cupola, but that is their inevitable destiny, and the sooner they are consigned to it the stronger will be our economic position.

Good Machine Tool Business This Year

IN this frame of mind on the part of manufacturing executives lies the comforting assurance of good machine tool business during 1928. The race for production at lowest cost will be won by the plant which first obtains the advantage of the new facilities.

Over-Extension of Sales Effort and Business Without Profit

TODAY the American metal worker stands far in advance of all his competitors in other lands. He has volume, quality and low production costs. In a general sense, he has 90 per cent of his market right at home among 6 per cent of the world's population — the greatest home market ever known. Now, the problem is, can he profit while he continues to serve? He has developed his sales opportunities to the nth degree in order to secure volume. For the same purpose he has reduced his price until this year many plants that did a good volume will show a meager profit, and in certain lines there have been some notable failures. This does not apply to machine tools only, but as well to many plants in other fields.

There has been enough prosperity to go around most years since the war, but American metal workers have seemed oblivious of this. From the steel makers right through to the small fry they have intensified an already highly competitive situation by over-extension of sales efforts. This cannot continue. Industry can only advance when it is profitable. There is an opportunity here in the American metal-working field for business leadership of a high type. Schooling is needed in the development and maintenance of a code of business ethics which shall include serving the trade well, while maintaining a price level sufficiently high to sustain normal development and yield a profit.

It has been a buyer's market, with such respectable slogans as "long established quality" and "continuity of good service" passing into the discard in favor of temporary advantage in price. It is significant that the American steel industry, the greatest and probably the most efficient of any single industry now existing, should have been a conspicuous sufferer. Quality and the ability to render efficient service are frail holds on the market in any period of intense competition.

There need be no fear, however, that the steel industry and the machine tool industry will meet the fate of the goose that laid the golden egg, even though in performance they do resemble that historic bird. There is a steady movement toward a stronger position. The merging of organizations, the elimination of obsolete and surplus facilities, and a general tightening up on overhead and in sales methods are proceeding. The new year looks like a period of higher prices and better profits even though volume remains as in 1927.

The Used Tool Problem

THERE has been a concerted effort during the year by groups of machine tool manufacturers to devise a workable plan for establishing the value of used tools offered by customers in trade when new tools are purchased. The lack of system in these transactions has been a fruitful source of charges of unethical conduct, annoying to manufacturers, dealers and customers alike. It is the present belief that by establishing a proper and generally accepted method of appraisal a basis can be reached upon which all interested parties may work equitably. The situation, of course, is simpler in the case of manufacturers who sell direct; but even in this field the absence of any recognized standard of values for used tools has provoked questioning and criticism. This will be one step toward a less erratic price policy.

Industries financed by the banks and the public are subjected to automatic check and review as to their price policies and earnings. The machine tool industry, to an unusual degree, is self-contained and does its financing from within. Therefore, it must furnish its own standards and make its own tests of financial success. Dissatisfaction with earnings has been general ever since the war, and reached the peak of expression in 1927.

Engineering Service Increasing, but It Should Be Paid for

THE situation has been strained to the breaking point by the cost of marketing the new designs which have appeared since the war. Every advance in the productivity of the tool has been accompanied by greatly increased cost of engineering services. Engineers to design machine tools have always been necessary. Now, however, high-grade engineering talent is needed to study the customer's particular requirements; to suggest the exact type and size of machine to meet his needs; to lay out his special tools and holding devices, and to demonstrate the machines and instruct operators after installation. As all of these processes except demonstration precede sale, and as none of this cost can possibly be recouped by bidders who do not make the sale, the resultant effect on sales costs is obvious. Even the producer making the sale has thus far been deterred in most instances from adding the full cost of these items to his bid.

That this is not a healthy condition will be admitted without argument; that the solution must necessarily be addition to price of all honest service rendered to the customer must eventually also be admitted. That the machine tool manufacturers are themselves now alive to the dangers of their situation seems equally evident from the tone of all their publications and the addresses at the meeting of the National Machine Tool Builders' Association, held at Lenox, Mass., in October.

A fair volume of business in 1928, therefore, is certain to produce an upward swing of machine tool prices, and the volume now anticipated is more than fair. It is expected to be greater than that of 1927, and perhaps equal to 1926. All the underlying conditions which ordinarily are examined to determine the prospects for the year appear to justify this conclusion. The fact that it is a presidential year has not been overlooked.

General Electric's Pension Plan

The General Electric Co., Schenectady, N. Y., has developed a new contributory pension plan, whereby employees pay in a small part of their wages from year to year to a pension fund. It supplements the old age pension system which the company has had in effect since 1912. At the same time a pension trust has been created, and instead of carrying a reserve on its balance sheet sufficient to meet obligations to employees reaching the retiring age, the company has turned over $5,000,000 to the new trust.

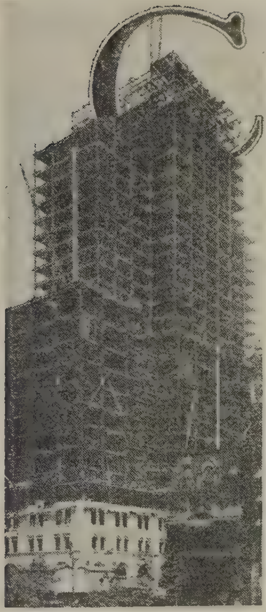
Pensions at present are computed at 1½ per cent of the earnings of employees for each year of continuous service. Under the contributory plan of additional pensions, which it is proposed to make effective Jan. 1, 1929, 1½ per cent of the annual earnings of the employees will be turned over to a board of seven, on which the employees will have representation. This money will be invested and held for the employees individually, and interest will be allowed to accumulate.

Under the new plan it is proposed to make 65 instead of 70 the retiring age for men, and 60, as at present, for women. When an employee reaches the retiring age, the custodians of the fund will pay the accumulated amount in full or in installments. If an employee leaves the service of the company or dies before reaching the pension age, the amount accumulated, with interest, will be given to him or to his estate.

Moderate Building Increase Forecast

Construction Expenditures in 1927 Decreased Less Than 2 Per Cent and Slightly Upward Trend This Year is Indicated, $7,000,000,000 Being Set as Possible Figure

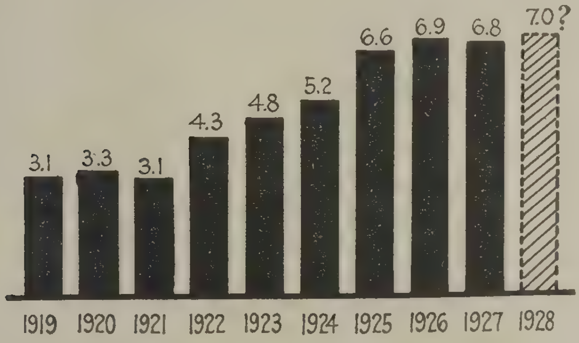
BY THOMAS S. HOLDEN*



CONSTRUCTION is investment. Construction activity measures the rate of flow of investment money into permanent improvements. Productive activities that increase the wealth of the country and accelerate its general prosperity create demands for increased improvements of every kind.

The attached charts should be of interest to the steel business from several points of view. For one thing, they picture the recent history of two industries (the construction industry and the automotive industry) which are among the best customers of the steel industry.

The most rapid growth of the automotive industry came between the years 1921 and 1923, during which production of passenger cars and trucks in the United States and Canada more than doubled. Automobile production increased very moderately between 1923 and 1926 and declined appreciably in 1927. Many economists consider the rapid expansion of the automotive industry, to the extent of doubling its previous output, as having been the chief accelerator of expanding industrial activity in recent years.



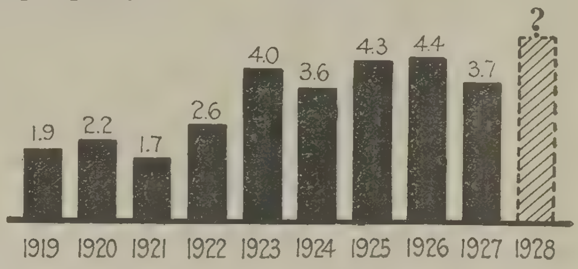
Construction Contracts in Billions of Dollars, Showing Stability From 1925 to Date

Referring to the chart of construction contracts, we see three distinct phases of three years each. The first three years shown on the chart were the years of post-war deflation. The next three years (1922, 1923 and 1924) were the years when building shortage was the dominant factor in construction demand. The third period, which began in 1925, has been a period of stability, with construction activity maintained at a very high level, and with investment considerations predominating in the creation of construction demand.

What Is the Next Stage?

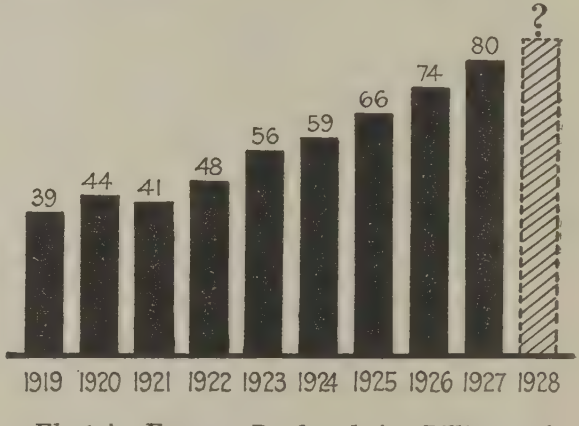
The question now before us is this: What is the next stage of development in the construction industry, decline or further expansion?

Further expansion at a moderate rate would ultimately be demanded by normal population increases and normal increases of commercial, industrial and social activity. Expansion at a more rapid rate might be the result of some influence which would utilize our enormous money and credit resources in a substantial program of increasing productive activity and accelerated prosperity.



Automobile Production in Millions of Cars, Showing Stability From 1923 to 1926, Inclusive, and Decline in 1927

The chart on production of electric energy shows uninterrupted growth from 1921 to the end of 1927. A chart showing the amount of investment money that has been flowing into the electrical industry during recent years would show an even more rapid growth than the one on amounts of energy produced. The writer has previously pointed out elsewhere the various other considerations that point to the electrical industry as being one very likely to expand considerably in the next few years and to give a considerable acceleration to general prosperity.



Electric Energy Produced in Billions of Kilowatt Hours, Showing Uninterrupted Growth From 1921

This would accelerate expanding construction activity. It would involve directly a large volume of construction of dams, power plants, transmission lines, and other work pertaining to electrical growth. Indirectly, if expansion of the electrical industry develops to such an extent as to stimulate a new era of industrial growth and increased prosperity it will create new demands for better buildings of every class—houses, apartments, factories, office buildings, schools and churches, and for community developments, consisting of both building and engineering projects, that make living more agreeable for a wealthy, prosperous people.

If this be true, then it looks as if 1928 might be a year of transition between the recent period of stabilized construction volume and the next period of expanding activity. This new year may not see large increases in construction activity, but it may very well see moderate increases, in preparation for more extensive increases later.

---

*Vice-president, in charge of Statistical Division, F. W. Dodge Corporation.

Total construction expenditures in 1927 decreased less than 2 per cent from 1926. Yet a very real recession in private construction work has been going on ever since the end of 1925. Private construction expenditures decreased 6 per cent from the previous year in 1927. This recession apparently came to a halt several months ago, since which time there has been moderate improvement in the rate of contract-letting for private construction work. Records of domestic corporate bond issues (omitting refunding issues) are the best advance indicators of the trends of contract-letting for private construction. Recent increases in this class of investment funds indicate increased contract-letting. Expenditures for community construction work (including all building and engineering work financed out of public funds or donations) increased 10 per cent in 1927. Recent increases in municipal bond issues indicate that this big general class of work ought to continue through 1928 in a volume at least as great as in 1927.

Moderate Increase Over 1927 Expected

In the chart, $7,000,000,000 is set as the writer's estimate of total construction expenditures this year. It is a moderate increase over 1927, but just a little bigger than any previous year.

Various spokesmen for the automotive industry promise a record year in 1928. Increased automobile production ought to add confidence to business generally and to encourage any business men who might be hesitating about making construction contract commitments. Increased agricultural purchasing power should be an added help to increased construction.

Any stimulus to general business expansion and largely increased construction activity that may come from further growth of the electrical industry is rather likely to be felt in full force after 1928. Economically and financially, the country seems ready for such a program as sketched above, but political considerations, as yet uncharted, may be uppermost this year.

Bridge Construction Gained 70 Per Cent

Total for All Classes of Work Exceeded $7,000,000,000 as It Did in 1926—Outlook for 1928 Is for Continuance of High Rate of Building

BY ALDEN W. WELCH*

THE value of construction contracts awarded in 1927 exceeded $7,000,000,000, as did that of 1926. The industry's record years began with 1922, and there is no visible reason to believe that they have ended with 1927. In fact, the latter half of last year showed greater activity than the first half, giving a momentum that is carrying into 1928 the assurance of continued lively contract-letting in the first half of the year.

This movement is not confined to building operations, but is reflected even more actively in the domain of public works and in private work other than buildings. The latter class includes 5000 miles of gas and oil pipe lines worth $120,000,000 authorized in 1927.

As the major demand for steel for construction is in the field of heavy construction, it is the statistics of this field that will be quoted hereafter. By heavy construction is meant commercial buildings of $150,000 and industrial buildings of $40,000 and more, and for other classes of work $25,000 and more. Contracts awarded in this group totaled $3,225,000,000 last year, a rise of 13 per cent over 1926. The gain has been in every class except waterworks, where contracts fell off 14 per cent in aggregate value. The greatest gain was in bridges—70 per cent. This is easily explained by the unusually large number of outstanding bridge projects placed under contract last year. Six of these—the two over Arthur Kill, between New Jersey and Staten Island; the one between New York City and Fort Lee, N. J.; the mid-Hudson at Poughkeepsie; the Lehigh Valley Railroad over Newark Bay, N. J., and the Delaware, Lackawanna & Western over the Hackensack River—total $45,000,000. Even in road work, the steadiest of all classes, there has been a gain in volume. And returning to buildings, contracts for heavy structures total $1,700,000,000, a gain of 9 per cent.

Can the pace be maintained in 1928? There is no information in the construction industry itself to indicate that it cannot or will not be. Construction activity is largely a reflection of general business prosperity. There are, therefore, certain factors broader than those found in any one industry that can slow down construction, not to mention business in general. One of these is narrowed markets caused by European competition. The tariff may hold the line in the United States, but the foreign markets are free for all. The relation of construction to exports was emphasized by E. J. Mehren in his address before the New York Building Congress on Oct. 5, when he pointed out that high construction costs place an overhead burden on manufactured products. Fortunately, although costs are double those prior to 1915, the trend is down and has been throughout 1927.

Coincident with the rapid increase in construction volume there has naturally been a strong increase in credits. Should credit give out, deflation would begin. This, however, is a broad business factor and does not reside in the construction industry. The industry is ready and able to carry on, and expects to keep busy in 1928.

Nineteen twenty-seven was only a fair year in the electrical industry, according to E. M. Herr, president, Westinghouse Electric & Mfg. Co., East Pittsburgh, Pa. While the volume of business has been reasonably well maintained, the cold spring and early summer greatly reduced the volume of fan motor business—an important line in the industry—and the intense competition in all lines has held prices on much of the product below normal, resulting in reduced profits to the manufacturer. During the past year, however, increased sales of all domestic appliances, with the exception of fan motors, have been shown throughout the country.

Better Automotive Outlook for 1928

Predictions Freely Made by Leaders of the Industry That Car and Truck Output This Year Will Total 4,400,000 to 5,000,000 Units—Ford Production Will Be Factor

BY NORMAN G. SHIDLE*

SALES volume in the automotive industry probably will be 15 to 20 per cent greater in 1928 than in 1927. Replacement parts makers, accessory manufacturers, and repair shop equipment companies, as well as car and truck factories, expect definitely increased activity during the next 12 months.

The final announcement of the new Ford model A of course is the largest single factor lending strength to predictions of marked advance in automotive volume. When Ford gets into quantity production, not only will passenger car output figures be increased materially, but the business of numerous companies making replacement parts and accessories designed to go on the Ford will be given a marked impetus as compared with the last half of 1927. And, despite the great relative increase in original equipment items on the model A as compared with the model T, there are many items which will be added through retail channels.

1928 Output May Reach 4,400,000 Units

Aside from Ford's unquestioned effect on the total vehicle production figures of the industry, the story of 1928 automotive prospects is far from revolving entirely around Ford. There is good reason to believe that the automotive industry in 1928 will build as many as 3,900,000 passenger cars and 500,000 motor trucks, and that Ford will not be entirely responsible for the increase. In considering Ford's probable contribution to the 1928 total, account must be taken of the possibility that he will not be able to get into full production as soon as expected.

The total output of passenger cars, exclusive of Fords, was nearly the same in 1927 as in 1926, although some very wide individual variations were recorded. There will be still further individual variations this year, but many of these doubtless will balance one another as they did in 1927. It is quite likely that producers in 1928, exclusive of Ford, will build at least as many and very probably quite a few more vehicles than in 1927.

Opinion in the industry, among vehicle manufacturers, parts makers, and dealers, leans strongly to the belief that 1928 automotive business will eclipse not only that of 1927 but that of the record year 1926, when 3,929,542 passenger cars and 535,006 motor trucks were built. To justify this trend of opinion, it is pointed out that 1927 in passenger car output fell below even the "off" year of 1924.

Some Predictions of a Record Year

While so important a figure as John J. Raskob has predicted a production of 5,000,000 in 1928 and while his opinion is upheld by several representative automotive men, it is the more common belief that the 1928 total will not reach such high proportions. Communications and talks with a number of important vehicle company executives indicate a rather general idea that the 1928 figure will be around 4,500,000 with a few voicing their belief in a more conservative figure.

The general opinion among parts and equipment manufacturers seems to be that 1928 will be an excellent year but that competition will be very keen, with individual efficiency and merchandising the outstanding elements in determining success.

The president of one unit parts company, for example, thinks "that competition in 1928 will be keener than in 1927, when, of course, it was very keen. This element would obviously tend to reduce profits, not only of car manufacturers but also of parts manufacturers." An accessory company executive, on the other hand, writes his belief that "car sales, car manufacturers' profits and the profits of component parts makers should all be more favorable in 1928 than in 1927. The fundamental reason is that the country is prosperous and has not been buying cars at a normal rate because of the hesitancy due to style changes, principally those of Ford. With the atmosphere cleared, following the New York show, the industry will spurt to record volume."

It is interesting that few automotive executives are bothering much about the fact that a new President will be elected in 1928.

Used Car Situation an Obstacle

The advent of the new Ford will not improve the used car situation in the opinion of most observers, as

---

*Directing editor, *Automotive Industries.*

the dammed up demand for the new model will release to the used car market an unusually large number of cheap cars in the first half of 1928.

Offsetting any tendency toward limiting production which the used car situation might produce is the constantly increasing activity in automotive export markets. Last year was featured by distinct gains in overseas' sales of both vehicles and parts, even while the domestic market was sagging a bit. In the first 10 months of 1927 American automotive manufacturers sold to foreign markets about $70,000,000 worth of goods in excess of the amount sold in those same markets in the first 10 months of 1926. The total export business in cars, trucks and parts—exclusive of tires and shop equipment in which increases also have been recorded—for the first 10 months of 1927 alone reached nearly $350,000,000, to which several millions more will be added when the final returns for 12 months are accumulated.

Progress in the Foreign Field

Every automotive line has continued to make progress in the foreign field. Exports of passenger cars from the United States and Canada increased from 238,376 for 10 months of 1926 to 276,200 for the first 10 months of 1927. For the same periods truck exports went up from 61,244 to 102,880 and parts exports increased from $76,368,993 in 1926 to $88,583,362. There is every evidence that continued stabilization of world affairs will result in still further advances in export sales in 1928.

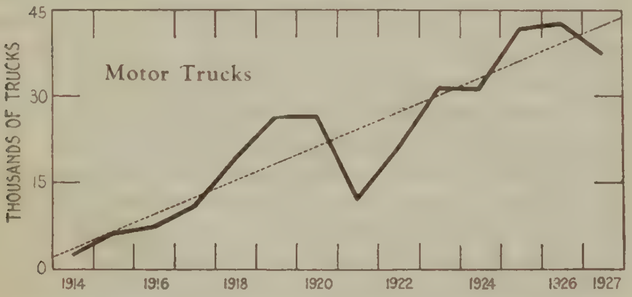
To estimate just how much plant expansion there may be in the automotive industry next year is difficult. It is certain that there will be many plants revamped, many new machinery layouts made and much new equipment purchased. The period of competition in which the parts makers, as well as the vehicle makers, find themselves is sure to result in even more intensive investigation of ways and means of cutting production costs, in study of the latest methods of doing old operations and in continued revision of factories and plants to meet changing requirements.

Selling prices seem almost certain to remain reasonably stable throughout the 1928 spring selling season. This in itself will be a big factor in keeping the industry on an even keel and in making 1928 a prosperous as well as a productive year. Some are of the opinion that there is a possibility of a slightly downward trend in prices in the lower price classes due to the new values to be found in the model A Fords at little more than the price of the model T.

There has been a growing feeling in the industry that price is no longer as powerful a sales weapon as it once was; very strong efforts to focus sales appeal on other factors have been taking effect. Consequently there is every reason to believe that no serious price readjustments are going to be made in the industry as a whole.

Automobiles and Motor Trucks Declined Greatly from 1926 High Records

BASED on an estimate of 100,000 vehicles in December, production of automobiles and motor trucks in the United States in 1927 aggregated about 3,350,000. This is a drop of 22 per cent from the 4,298,785 vehicles reported by the Department of Commerce for 1926. The figures do not include Canadian production. The output for 1927 was the lowest since 1922. It compares with 4,174,886 in 1925, with 3,505,624 in 1924 and with 3,951,014 in 1923.



Motor Truck Production, Which Includes Buses, Has Kept Up Better Than That of Passenger Automobiles. The dotted line shows the long-time trend, mathematically determined. This last year has fallen a little below it. Figures are monthly averages

PRODUCTION OF AUTOMOBILES IN THE UNITED STATES

	1927		1926	
	Passenger Cars	Trucks	Passenger Cars	Trucks
January	199,650	39,276	277,831	31,713
February	264,171	40,582	325,122	39,057
March	345,911	48,506	387,570	46,897
April	357,009	47,728	389,833	51,473
May	357,148	46,949	375,317	45,862
June	278,728	43,218	343,708	44,192
July	236,866	31,603	319,688	39,587
August	274,350	34,432	382,651	43,954
September	226,440	33,938	352,202	43.485
October	182.941	36,669	292,562	41,859
November	108,903	24,299	222,419	33,881
December	80,000(a)	20,000(a)	139,850	28,072
Total	2,910,000(a)	447,000(a)	3,808,753	490,032

(a) December estimated.

Passenger automobiles made in 1927 in the United States, with December estimated at about 80,000, aggregated approximately 2,910,000. Trucks, with December estimated at 20,000, amounted to 447,000. The passenger car total showed a drop of nearly 24 per cent from the 3,808,753 of 1926, and made the lowest total since 1922. Trucks showed a drop of only 9 per cent and, with the exception of 1926 and 1925, made the largest total on record.

Automobile Production Fell Below 1924 in 1927, as Shown by the Monthly Averages in the Diagram. The dotted line is the long-time trend

Figures for cars and trucks separately through the first 11 months of 1927, with estimates for December and with comparisons for 1926, are given in the table.

Both trucks and passenger cars fell below their calculated "normal trend lines" in 1927. The two charts are by no means parallel, however. The well-remembered spurt in trucks in 1917 and 1918, and curtailment of "pleasure" cars, show up clearly. Whether the year 1927 would have shown a drop in either type, but for the Ford changes, is a disputed question.

Much Steel Used in Oil Fields

Less Drilling Done Last Year, but More Line Pipe and Storage Tanks Built—The 1928 Tonnage Expected to Be Approximately as Great

BY VIRGIL B. GUTHRIE*

A TREMENDOUS volume of steel tonnage was absorbed by the oil industry in 1927. Probably it amounted to almost as much as in 1926, despite curtailing of active operations in many producing fields in the country due to the overproduction of crude. To offset this decline in activity generally, there was highly intensive work in such districts as the Seminole field, Okla., in some of the California oil fields and in several new districts in Texas. Texas will probably be the most active State in development work in 1928.

The entire oil industry put about 65,000,000 barrels of crude into storage in 1927, whereas in 1926 it withdrew from its stock about 22,000,000 barrels. This volume going into storage in 1927 was for the most part in the new areas of flush production, and new steel storage had to be built to take care of it. The amount of steel used in plates in constructing big field tanks, 55,000 and 80,000 barrels capacity, was more than the 175,000 tons used for such purposes in 1926.

Drilling Wells

Wells drilled during 1927, either as oil wells, gas wells or dry holes, totaled about 23,000 and called for tonnages of pipe according to the following estimates:

District	No. Holes	Aver. Depth	Tons Each	Approx. Total	Change from 1926
Eastern States	6,500	2,000	30	195,000	5,000 less
Oklahoma	4,600	3,000	90	415,000	35,000 less
Kansas	1,370	3,000	111	150,000	50,000 less
Texas	7,000 to 8,000	2,500	33	260,000	50,000 more
Louisiana-Arkansas	1,200	2,500	35	40,000	15,000 less
Rocky Mountains	1,100	3,500	140	150,000	60,000 more
California	950	4,000	115	110,000	10,000 more

The total of pipe going into drilling wells during 1927 was therefore probably around 1,250,000 tons, which is below the total for 1926. Intensive developments in a few districts went far to offset slackening operations in many fields during the summer and fall.

It is probable that the decline in field work which has become more noticeable in the oil producing industry the last half of 1927 will continue during the early part of 1928. There are no signs as yet of a coming demand for crude which cannot be met, and more, by the fields now developed or in process of development.

Field Storages

Due to over-production in flush fields of Oklahoma and Texas and consequent storage of crude, the tonnage of steel going into storage tanks was larger in 1927 than the year preceding. Some 285,000 tons of material went into this service in Oklahoma, Texas and California, the three most active States during 1927. This figure was augmented by that tonnage going into small lease tanks, which is impossible to estimate. The total may be nearly double that bought in 1926 for similar purposes.

In Oklahoma it is estimated 21,000,000 barrels of crude storage were built in 1927, calling for around 84,000 tons of steel. Of this amount, 76,000 tons went into storage tanks in the Seminole field.

California put 10,000,000 barrels of crude into new steel storage in 1927, using 40,000 tons of steel plates.

Texas put 35,000,000 of crude into new storage at tank farms and some 5,000,000 barrels into new storage at refineries, calling for about 160,000 tons of plates for this purpose.

For 1928, it is not considered likely that nearly the amount of steel storage put up in 1927 will be built in Oklahoma, and probably not in California. Texas, however, with several new fields likely to be developed further in 1928, may overbalance the loss.

Pipe Lines

So many thousand tons of steel pipe were bought for oil and gas transport that this became the backbone of the tubular goods market. An editorial survey, published in THE IRON AGE for Dec. 22, 1927, places the tonnage required for notable projects contracted for at 300,000 tons in 1926, 575,000 tons in 1927, and 700,000 tons in prospect for 1928. Not all of the work started in 1927 was completed by the turn of the year, but at least 400,000 tons of pipe was put into trunk lines in Oklahoma, Texas and Kansas alone.

Oklahoma built 600 miles of 4-in. line, 350 miles of 6-in. line, 450 miles of 8-in. line and 150 miles of 10-in. line, these altogether requiring 64,000 tons of pipe. In addition to the usual amount of shorter lines, a 100-mile stretch of 6-in. pipe was built in California—altogether buying about 10,000 tons for these purposes. Texas had the biggest pipe line construction program, its new fields being at considerable distance from existing trunk lines, refineries, or tide water. Furthermore, some companies were compelled to increase the carrying capacity of their pipe line systems running from the Mid-continent fields through Texas to the Gulf refineries. Another company built the first division of what will be a transcontinental system of oil lines. Such activity amounted in round numbers to 1950 miles of 8-in. and 500 miles of 10-in. line. Add to this about 300 miles of gas pipe of 20-in. diameter, and the total laid in Texas consumed over 300,000 tons of steel.

Work is now starting on 200 miles of 10-in. line in Oklahoma. In Texas there is building 250 miles of 8-in. and 800 miles of 10-in. line as the year opens. Many projects are under way which will entail considerable pipe line construction in 1928, not only of oil lines, but also larger gas lines.

In Other Branches

Aside from this consumption of steel in the producing end of the oil industry—by far the greatest of any branch—the marketing branch of the industry became a good outlet for plates for small storage tanks in 1927. It is impossible to estimate the tonnage going into this use.

Refineries are demanding an increasing amount of special steel products capable of resisting high degrees of pressures and heat, and the corrosive effects of sulphur-bearing crudes. In tonnages this would not amount to any large figure, of course, but it will be a marked influence on the production of special steels.

Better Prospects for Steel Jobbers

Moves Made by Producers to Divert Small-Lot Business to Warehouses Point to More Stable Market Conditions

BY GEORGE F. TEGAN*

STEEL jobbers look forward to the future more hopefully than at any time in the past five or six years. Although 1927 was discouraging from the standpoint of business volume and satisfactory returns, more definite progress was made in the direction of an adjustment of the respective fields of the mills and warehouses than in the previous five years combined. The mills have learned that in many instances it costs much more to take orders of warehouse size than the results warrant in either profit or good will, and in some lines they have set up charges on small-lot orders commensurate with the extra costs of handling and assembling. The purpose of these changes is to divert small-lot business back to the warehouses.

Prior to and during the war, steel merchants obtained 80 per cent of their profits, it is estimated, on business that could not be handled by the mills. Then, as a result of war-expanded productive capacity and better railroad service, out of which grew short-range buying and "zero" inventories, there came a period when there was almost no order so small that the mills would refuse it.

This was not the only way that the steel merchant was hit. One of the accompanying developments of short-range buying was a marked narrowing in the range of price fluctuations. The jobber who formerly operated on the theory that success in steel merchandising lay far more in buying right than in selling, found it impossible to buy heavily when prices appeared low and hold for an advance. The general drift of steel prices in the past five years has been downward and chances for speculative profits have been small.

The merchant has long performed a useful function, and there are few who will dispute that he will continue to do so, but conditions have so changed in recent years that this function in the future is likely to be more definitely of a complementary character, offering service that can be less economically supplied by the steel producer. The mills still will take small-lot business and can handle such business, but plainly the steps they have taken in the past year have been toward a greater diversion of such business to those better equipped to handle it.

The first step in the bridging of the difficulties between mill and merchant was taken last March, when the makers of bolts and nuts announced a new price list and a common discount to apply on large lots. This new mode of selling also provided that for broken cases the charge would be 10 per cent more than for full cases of a size. Many jobbers protested this extra charge on the score that, in order to avoid it, they would have to stock large quantities of slow-moving sizes and styles, but what they seemingly overlooked was the fact that, by making this charge for broken cases, the manufacturers were by that act divesting themselves of a kind of business that they had found extremely unprofitable and turning it over to the jobber. The warehouse was not expected to do business for less, but rather to name resale prices that would put the cost of small-lot purchases where it belonged—upon the buyer who bought in retail, instead of wholesale, quantities. Bolt and nut manufacturers went even further; to the habitually small customer they had acquired when no order was too small for them to handle, they began quoting an even higher price than the small-lot buyer could get from the jobber or merchant.

The bolt and nut prices and discount were not formulated over night, but, on the contrary, represented at least two years of intensive study, not only of producing costs, but costs of assembling, packing and shipping. One large manufacturer found that in packing alone there was a cost of $9 a ton, which had to be absorbed under the old schedule. Never before has there been a better stabilized market in these lines than in the past nine months, or a time when the merchant was able to handle them more satisfactorily.

The next effort of a similar character came last October, when the jobber was plainly recognized in a card of extras on cold-finished steel bars and shafting, distribution of which is very heavy through the warehouses. Until that time, manufacturers imposed no quantity charge for lots as small as 1 ton; when the quantity was 1999 to 1000 lb., the charge was 20c. per 100 lb., and for less than 1000 lb., 50c. per 100 lb. In the new card, which came out under date of Oct. 17, 1927, later modified to conform with a new card of extras on hot-rolled bars, the following quantity differentials were imposed: 20c. per 100 lb. for lots of less than 2 tons down to 1 ton, 40c., for lots of 1999 lb. to 1000 lb.; 75c. for lots of 999 lb. to 500 lb., and $1 per 100 lb. for lots of less than 500 lb. What could be more palpably an effort to turn the small-lot orders to the jobbers than the imposition of these quantity charges?

Encouragement to the jobbers was also given in the new card of wire nail extras announced and effective as of Dec. 1, 1927. There are no longer any base sizes of nails, i.e. sizes that sell at the base price, but the jobber who can now place a carload order, whether entirely made up of nails or mixed with other products, gets a concession of 10 per cent under the revised card.

The principal change in a new card of extras on hot-rolled bars and small shapes is in the quantity differentials, which are raised to a point where the small-lot buyer can do as well with his local jobber as by going direct to the mill. When the quantity is less than 4000 lb., but not less than 2000 lb., there is a lump sum charge for assembling and handling of $3. When the lot is less than 2000 lb., but not less than 1000 lb., the charge is $6, and for lots of less than 1000 lb. $10 is added to the net price of the lot.

Railroad Purchases Take Less Steel

Cars Ordered Show a Slight Gain Over 1926, but the Number of Those Built Was Smallest Since 1921—Capital Expenditures of Class I Roads Fell Off 15 Per Cent

THE amount of steel taken by the railroads of the United States in 1927 was considerably less than was consumed in 1926, not excepting rails. This applies to direct purchases by the roads as well as purchases by companies engaged in the building of railroad equipment.

Capital expenditures of the Class I roads for the year were approximately $750,000,000, a decrease of $135,000,000 or 15 per cent from the 1926 record, as estimated by the American Railway Association.

Actual capital expenditures since 1920 follow:

1920	$653,267,000	1924	$874,743,000
1921	557,035,000	1925	748,191,000
1922	429,273,000	1926	885,086,000
1923	1,059,149,000	1927	750,000,000*

---

*Estimated.

Equipment Expenditures Below 1926

Expenditures in 1927 for equipment, which includes cars and locomotives, amounted to $270,000,000 compared with $380,000,000 in 1926. The outlay for roadway and structures, additional track, heavier rails, additional ballast, shops and engine houses, including machinery and tools, amounted to $480,000,000 compared with $495,000,000 in 1926.

Due to the purchase of upward of 12,000 cars in in the last two weeks of the year, the total number of freight cars ordered in 1927 ran ahead of the 1926 total by nearly 5000. *Railway Age* computes the total of cars ordered for service in the United States as 71,606 compared with 67,000 in the preceding year. In addition there were 2133 cars ordered for service in Canada and 646 for export to other countries. The total of locomotives ordered was 808, including 58 for Canada and 54 for other countries.

Orders Received by Car Builders

The above figures include equipment authorized for construction in railroad companies' own shops. Orders received by the independent car builders, also deliveries, are shown in the following table, but are only for 11 months:

CARS DELIVERED

	Domestic	
	November	Jan. 1 to Nov. 30
Freight train cars	3,754	52,294
Passenger train cars	164	1,254
Interurban, subway and other heavy elec. cars	53	536
Self propelled cars	11	43
Street railway cars	57	442
Freight car repairs	124	5,947

CARS ORDERED

	Domestic	
	November	Jan. 1 to Nov. 30
Freight train cars	1,378	46,246
Passenger train cars	0	1,164
Interurban, subway and other heavy elec. cars	120	226
Self propelled cars	34	115
Street railway cars	25	490
Freight car repairs	50	5,110

The number of freight cars built and delivered in 1927 was the lowest since 1921. The total for domestic use, as estimated by *Railway Age*, was 63,390, while the figures for preceding years are as follows:

1919	82,845	1923	145,083
1920	46,784	1924	104,093
1921	39,259	1925	94,907
1922	63,866	1926	78,870

Railroads built 779 miles of new main line in 1927, but 202 miles of track were abandoned and taken up, leaving a net increase of trackage of 577 miles.

EQUIPMENT ORDERED IN UNITED STATES AND CANADA

(Compiled by *Railway Age*)

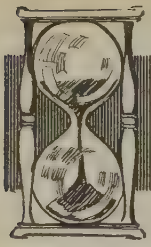
	Locomotives	Freight Cars	Passenger Cars
For service in United States	696	71,606	1,612
For service in Canada	58	2,133	143
For service in other countries	54	646	48
Total	808	74,385	1,803

EQUIPMENT BUILT*

	Locomotives	Freight Cars	Passenger Cars
Domestic	958	63,390	1,785
Canada	51	2,851	126
Export	167	1.087	50
Total	1,176	67,328	1,961

---

*Includes builders and railroad company shops.



High Lights of 1927—

January

PRODUCTION of 47,000,000 tons of steel ingots in 1926 exceeds previous record by nearly 3,000,000 tons . . . Manufacture of 3,750,000 passenger cars and nearly 500,000 trucks in 1926 establishes new automotive production record . . . . Comprehensive survey looking to the setting up of national and international standards for industry is announced by Secretary Hoover . . . . Bill providing for medals of honor and monetary awards for scientists in Government work is introduced into Congress . . . . Heat recovery, reduced equipment maintenance and production of better coke are purposes of dry-quenching process installed at Rochester, N. Y. . . . . Treasury Department issues anti-dumping order on pig iron from Germany; at same time rolled steel imported from Germany is declared not subject to countervailing duties.

February

NEW scrap classifications, embracing important changes in No. 2 heavy melting steel and in various grades of blast furnace scrap, are announced by Bethlehem Steel Co. . . . . Exports of machinery exceed $400,000,000 in 1926, a gain of $15,000,000 over previous year . . . . Accidents in iron and steel industry over 1910-1925 period declined 62.1 per cent in frequency and 51.9 per cent in severity, according to data issued by Bureau of Labor Statistics . . . . George W. Prentiss & Co. observe seventieth anniversary as manufacturer of wire at Worcester, Mass. . . . . Duty on pig iron is increased 50 per cent (to $1.12½) on request of Eastern merchant producers. . . . American Rolling Mill Co. announces purchase of Norton Iron Works and Ashland Steel Co. as part of extension program at Ashland, Ky.

March

ANNOUNCEMENT of new list prices on bolts and nuts brings sweeping revision to conform to present manufacturing costs and to permit single discount . . . . Companies producing 75 per cent of rolled and finished steel earned 7.37 per cent on investment in 1926 as compared with 5.93 per cent in 1925 . . . . Intermediate grade of American Society for Testing Materials is adopted as single standard for billet stock reinforcing steel . . . . General investigation of freight rates on iron and steel products in Official Classification territory is opened by Interstate Commerce Commission at Pittsburgh . . . . Standardized spindle end for milling machines is adopted by manufacturers' group of National Machine Tool Builders Association.

April

UNION miners of bituminous coal in western Pennsylvania, Ohio, Indiana and Illinois go out on strike. . . . Daily rate of steel ingot production in March, at 168,867 tons, sets new high record. . . . . Yearly pig iron production per furnace in Pittsburgh district has increased more than 50 per cent in last 24 years, survey shows . . . . Production of 3,200,000 tons of steel rails in 1926 largest since 1913 . . . . To advance standards of technical education, 150 engineering colleges unite to establish summer schools for training of teachers at the University of Wisconsin and Cornell University . . . . Superior Sheet Steel Co., Kokomo Steel & Wire Co. and Chapman-Price Steel Co. are consolidated as Continental Steel Corporation and plan ultimate ingot capacity of 250,000 tons annually . . . . Silver anniversary meeting of American Electrochemical Society is held at Philadelphia . . . . Robesonia furnace property in Pennsylvania, on which pig iron has been made almost continuously since 1793, is sold to Bethlehem Steel Co. and furnace will be dismantled . . . . Setting up of distance scales for iron and steel freight rates in Southwest by Interstate Commerce Commission brings about far-reaching changes in relationships.

May

STEEL ingots weighing 63,000 lb., converted into slabs on 206-in. plate mill of Lukens Steel Co., are believed to have set new record. . . . Hot-rolled and cold-rolled strip institutes are formed by country's leading producers with scientific rather than trade functions as their purpose . . . . United States Steel Corporation establishes department of research and technology, to be directed by Dr. John Johnston, late of Yale University . . . . Continuous rolling of sheets is begun at plant of Columbia Steel Co., Butler, Pa. . . . . Railroads adopt recommendations of Department of Commerce to revise and coordinate scrap classifications for sake of uniformity.

June

ROLLING of sheet steel from ingot to finished product in continuous process begins at new American Rolling Mill Co. plant at Ashland, Ky. . . . . New England mills and railroads ask for special consideration in concluding session of general inquiry into iron and steel freight rates held by Interstate Commerce Commission . . . . Electrified structural mills at Homestead works of Carnegie Steel Co. are started when Judge Gary passes hand over glass sphere in his New York office . . . . Advances in magnetic testing, in X-ray developments, in fatigue studies and in general research are reviewed at silver jubilee meeting of American Society for Testing Materials . . . . Chamber of Commerce of United States undertakes survey to determine extent and tendencies of industrial migration.

Metal Trades in Review

July

AVERAGE price of heavy melting steel scrap at Pittsburgh, Philadelphia and Chicago reaches $13.48 a ton, the lowest level since early in 1922 . . . . Agreement on definitions for terms relating to heat treatment is reached by American Society for Testing Materials, American Society for Steel Treating and Society of Automotive Engineers after six years of negotiations . . . . Construction contracts during June in 37 Eastern States, amounting to $632,478,000, set new high record . . . . American Rolling Mill Co. purchases Columbia Steel Co. and Forged Steel Wheel Co., with plants at Butler, Pa., and Elyria, Ohio . . . . River shipments of pig iron from St. Louis industrial district are revived after nearly a half century's intermission . . . . American Manganese Producers' Association is formed to further production, beneficiation and use of domestic manganese-bearing ores and retain existing tariff on manganese products . . . . Tariff Commission begins hearing on fluorspar at request of domestic producers that duty be increased 50 per cent . . . . Intensive development of Russian metals industry involving an ultimate expenditure of $300,000,000 in iron and steel plants is announced here.

August

DOMESTIC steel producers ask for application of anti-dumping act on imports of German rolling mill products. . . . Merger of six large manufacturers of radiators and boilers as National Radiator Corporation embraces fifth of country's output . . . . Elbert H. Gary, chief executive officer of United States Steel Corporation, president of American Iron and Steel Institute and recognized leader of industry, dies in eighty-first year . . . . Weirton Steel Co.'s strip sheet mill, rolling strip sheets up to 48 in. wide, is third continuous sheet or strip rolling mill to be put into operation during year.

September

MACHINE Tool Congress, formed to provide a forum for discussion of mutual questions by users, distributers and makers of machine tools, holds first meeting at Cleveland in connection with National Machine Tool Exposition . . . . National Metal Week observed at Detroit by joint meeting of American Society for Steel Treating, American Welding Society and Society of Automotive Engineers . . . . British steel makers announce agreement to allow rebates to all consumers who use only materials of British origin . . . . Blast furnaces and other assets of Rogers-Brown Iron Co., Buffalo, are purchased by M. A. Hanna Co.

October

PROPOSED reduction in export freight rates on iron and steel articles from Pittsburgh district to North Atlantic ports is announced. . . . Foreman training in United States has increased several hundred per cent in last year, survey shows . . . . Charles M. Schwab, chairman of Bethlehem Steel Corporation, succeeds Elbert H. Gary as president of American Iron and Steel Institute . . . . Contract is let for largest suspension bridge ever designed, spanning Hudson River at New York, which will require 70,000 tons of structural steel and 31,000 tons of wire cable . . . . Composite price of finished steel reaches 2.293c. per lb., the lowest level since August, 1922.

November

NEW billet and rod mill with delivery maximum of 4000 ft. per min., exceeding fastest previous mill by 500 ft. per min., is placed in operation at Worcester plant of American Steel & Wire Co. . . . . Composite pig iron price reaches $17.54 per ton, the lowest in more than 11 years . . . . Iron and steel division of American Society of Mechanical Engineers holds first meeting at Youngstown, Ohio. . . . Negotiations completed for amalgamation of Republic Iron & Steel Co. and Trumbull Steel Co., which will bring together total ingot capacity of 1,900,000 tons and wide range of finished products . . . . German industry approaches pre-war status with pig iron production within 23 per cent of 1913 and production of finished steel within 6 per cent of pre-war year.

December

DISCOUNT of 10 per cent on carload lots and average price advances of 15c. to 20c. a keg are embodied in new card of extras on wire nails . . . . November steel ingot production, at 119,300 tons daily, reaches lowest point since July, 1925, while daily pig iron production of 88,279 tons, is lowest since August of that year . . . . Bethlehem Steel Co. adopts mill bases on bars, plates and shapes, quoting prices f.o.b. Bethlehem, Coatesville, Sparrows Point and Lackawanna instead of on Pittsburgh base . . . . Objections of German producers to resuming 8-hr. day may lead to suspension of operations in German iron and steel plants . . . . Joseph G. Unemployment—A New By-Product of Prosperity

Surplus Labor Released by Technical Improvements in Production Is Gravitating to Luxury Industries—Wage Trend, Colorado Strike and Employee Representation Surveyed

UNEMPLOYMENT no longer finds its cure in prosperity. Not only is there surplus labor in overdeveloped industries like coal mining, but more and more man power is being released by technical improvements in production. A new problem in industry has arisen: What is to be done with the labor dispensed with by better methods and more highly developed equipment? Are luxury industries the logical outlet for our new unemployed?

This and other phases of current industrial relations were discussed in an IRON AGE interview with Arthur H. Young, for many years identified with employment work in the iron and steel industry and now industrial relations counsel in New York. The first question put to him was:

"To what extent has employment declined in manufacturing industries during 1927?"

"There has been a marked decline," replied Mr. Young. "Its extent is shown by the Bureau of Labor Statistics index, which receded from a high of 91.4 in March to 87.3 in October, with an estimated figure of approximately 85 in December. This was a drop between the high and low points in the year of about 7 per cent, which means roughly that at the close of 1927 there will be approximately 600,000 fewer persons employed in manufacturing industries than in March of 1927, and upward of 400,000 less than in December, 1926."

"Does this decline reflect a swing toward industrial depression?"

"No; paradoxically, the cause of unemployment at this time does not lie in a lack of prosperity—rather it is largely traceable to prosperity.

"Capital has been abundant and has gone back into production in the form of great increases in mechanization and new processing. Management is more than ever on the alert to improve methods, as well as cut costs through reduction of personnel. Properly applied incentives and employee cooperation also have increased production per man. A new phenomenon in the industrial world—technological unemployment—is the result.

"Of course, there are added to those unemployed because of the reasons just considered those affected by the coal strike, the period of shutdown at the Ford plants, and the reduction in expenditures by railroads and public utilities. This whole situation suggests that the problem of unemployment is not entirely solved by ironing out seasonal variations or by achieving business prosperity."

"If the working forces of industry are steadily being reduced, what outlet remains for the labor thrown out of employment? Will there be a new movement to the land?"

"No, the same forces that are eliminating labor in the factory are at work on the farm. The mechanization of agriculture is at hand. The tractor and tractor-drawn implements have passed through the experimental stage and are now finding general adoption. The reaper-thresher, also known as the combine, has proved a success not only in the drier plains States, but also in the moister climate of the Middle West. This equipment is materially reducing the amount of

A. H. YOUNG directs the activities of the Industrial Relations Counselors, Inc., New York, an organization that engages in research along industrial lines, makes surveys of industries and plants and acts as counsel in matters of personnel administration for a number of important industrial corporations. Mr. Young's first contact with industry was as a boy at the Joliet, Ill., works of the Illinois Steel Co. From there he went to the Minnequa plant of the Colorado Fuel & Iron Co., Pueblo, Colo., and in 1905 returned to the Illinois Steel Co., taking a position of timekeeper at its Chicago works. He was subsequently chief payroll clerk, statistician, assistant supervisor of labor, chief safety inspector and supervisor of labor and safety. In 1917 Mr. Young left the Illinois Steel Co. to become director of the American Museum of Safety and served as the Government's chief safety expert during the war.

From July 1, 1918, to July 1, 1924, Mr. Young was manager of industrial relations at the International Harvester Co., Chicago. He was a co-author of the Harvester Industrial Council Plan and was responsible for the administration of this significant development in employee representation. He was president of the National Safety Council from 1921 to 1922 and is vice-president of the American Museum of Safety. In 1919 the museum awarded him the Louis Livingstone Seaman medal for conspicuous accomplishment in safety. In July, 1924, Mr. Young became industrial relations counsel for the law firm of Curtis, Fosdick & Belknap, New York. The industrial relations staff of the firm was reorganized as the Industrial Relations Counselors, Inc., in May, 1926.

labor required per acre, thereby insuring the same yield with a smaller number of farm operatives."

"If gains in the technology of industry, as well as of farming, mean smaller working forces, what is to become of our unemployed?"

"This question cannot be answered without challenging established ideas. Chastened by our age-long struggle for mere subsistence, we instinctively recoil from any tendency toward increased consumption of luxuries. Since thrift is essential to build up new reserves of capital, luxuries have been regarded as an economic waste and a threat to sustained prosperity.

"Yet it is precisely in the purveying of luxuries and services of various kinds that labor released by industry is finding employment. Automobile manufacture, still classed by many as a luxury industry, has created a vast market for labor, not only in the building of motor cars, but in the construction and patrolling of roads, and in the operation of countless oil stations, garages, refreshment stands, road houses and hotels. It has stimulated the growth of two great sister businesses, the cement and oil industries. The far-reaching effects of the automobile are seen in every phase of our economic life. Similarly, although on a smaller scale, the radio industry is offering opportunities to surplus labor."

Luxury Industries Needed to Support Basic Industries

"Is it your opinion that luxury industries are needed to sustain mass production in the basic industries?"

"Yes. Mass production implies mass demand. It would be futile for so-called essential industries to lower costs through labor saving, if in the same stroke they curtailed their markets by releasing labor which could not find employment elsewhere. Man's mastery over nature has passed the point where the Malthusian theory can be taken seriously. We no longer believe in the fatalistic doctrine that if wages increase, population is sure to multiply until wages are forced back to a subsistence level. Mass production and its companions, waste elimination and standardization, are decreasing costs to such an extent that man can enjoy the necessities of life and a fair measure of luxuries besides. If only part of the population is required to supply the necessities, it is obvious that surplus labor is available to increase the pleasures and comforts of life.

"However, I do not wish to be misunderstood. I have been discussing broad trends. Progress toward balanced industrial relations is not a uniform, sweeping movement. In a complex organism like modern industry it is inevitable that the response to economic stimuli should be more rapid in some directions than in others.

"During the past year it has been recognized more widely than ever before that a large section of the general body of laborers has been sharing little, if at all, in the prosperity of the last few years. In an investigation made by the Bureau of Labor Statistics it was found that unskilled laborers as a class were receiving rather meager wages and were not regularly employed. The highest paid group was found in the bituminous coal mining industry and earned as much as $37.69 per full-time week. The lowest earnings were found in the same industry and ranged from $10.34 to $11.03 per week for inside and outside laborers. During the last few years employees in coal mines have averaged about 180 days per year, or the equivalent of 30 full-time weeks. In the lowest paid districts, the average weekly pay for all the industries investigated would run under, rather than over, $17 per week, while for all districts the average apparently would be about $25 per week."

Present Trend of Wages Downward

"What is the general tendency of wages at the present time?"

"From January through August, the total amounts disbursed as payrolls in manufacturing industries failed to fall off as much as employment, so that the average earnings of persons remaining at work increased over 1926. This does not mean, however, that the persons who remained at work necessarily received increases in wages, because, in many industries, it is known that unskilled laborers were the ones laid off and the average pay of those remaining on the rolls would naturally show an increase. Since August, moreover, payroll totals have been declining more rapidly than has the number of employees, and the index of average per capita earnings, constructed by the Bureau of Labor Statistics' figures, has fallen below the corresponding figures of 1926. This fact would seem to point to some cutting of wages, though published reports of agencies collecting such information continue to show a preponderance of increases of wages over decreases. The number of firms reporting to these agencies is small, however, so that there is room for question whether the reports are really representative of conditions.

"High average per capita earnings with a declining trend in the cost of living resulted in sharply rising real earnings in the first half of 1927. During the latter half of the year, however, average per capita earnings have been declining and, on the whole, real earnings have been declining in about an equal, if not greater, ratio."

The Colorado Strike and the Works Council Plan

"The coal strikes were the major industrial disturbances during 1927. Does the Colorado strike indicate a break-down of the works council plan which has been in effect in some of the largest mining operations in that State?"

"No. It cannot fairly be said that the works council plan failed. Rather, the increased mobility of pickets through the use of automobiles widened the effectiveness of organized intimidation.

"The strike was called on Sept. 4 by leaders of the Industrial Workers of the World. This general strike had its beginnings in a four-day strike called late in August as a protest against the Sacco-Vanzetti decision. Both the protest and general strikes centered originally around the communities of Aguilar and Walsenburg in which are maintained I. W. W. headquarters. The general strike meeting held at Aguilar on Sept. 4 demanded a five-day week, a 6-hr. day and a 40 per cent increase in daily wages. After an investigation by members of the State Industrial Commission of both the protest and general strikes, announcement was made that the strikes were illegal, and the leaders did not properly represent the workers. The strikers were warned against picketing and advised to return to work. Although the agitation had its inception in the southern coal fields, the movement spread into some of the northern counties, which were seriously affected by the time a strike actually occurred on Oct. 18.

"In many of the mines, both in the southern and northern part of the State, employees were loyal and preferred to continue operations, but for reasons of general safety, managements decided that it was advisable to shut down.

"On Oct. 1 the Colorado Fuel & Iron Co., in negotiations with its employee representatives, granted a wage increase, which was followed by similar action by other bituminous companies in the southern field. No action on wages was taken at this time by the lignite mines, although during the strike the Rocky Mountain Fuel Co., whose Columbine mine was the only one in the northern field to operate after the strike was called, agreed to a 50 per cent increase in wages.

"Toward the end of October the picketing activities of the strikers multiplied. The spread of the strike and maintenance of morale among the strikers are largely due to the use of the automobile in carrying organizers, speakers and large groups of strike leaders from mine to mine. The frequency of encounters between pickets and company representatives engaged in protecting property increased and there were some incendiary fires. On Oct. 24 the Governor of the State visited the scenes of the strike, and on Oct. 30 the Adjutant-General of the State announced that picketing must cease. The month of November saw some general improvement as a result of the activities of the State and organized effort of employees who desired to cooperate with managements in resuming operations.

"Just at the time when the situation seemed to be adjusting itself the head of the Law Enforcement Bureau of Colorado ordered his men to fire upon a company of striking coal miners who were advancing toward the Columbine mine and, according to press dispatches, five were killed and several wounded. This tragedy has brought the whole situation to the forefront in glaring headlines and again focused public attention upon the coal mining industry in Colorado."

Labor Unions and Employee Representation

"What is the general attitude of labor organizations toward works councils?"

"At the 1926 convention of the American Federation of Labor, held in Detroit, there was considerable discussion of employee representation, resulting in a resolution strongly condemning such arrangements and a resolution empowering the executive council to levy a special assessment to be devoted to a thorough investigation and report on the so-called company unions. There are no indications that this plan is being carried out, but instead, weak and perhaps easily vulnerable individual company plans are being attacked. At the 1927 convention, held in Los Angeles, there was no reference to the project, while expressions of endorsement were given to union-management plans of cooperation of the Baltimore & Ohio Railroad type, with expressions of desire for further developments along this line. Personally, I cannot see that bona fide employee representation and enlightened trade unionism are mutually exclusive. In any event, it is a rather wholesome outlook to view all of the principal factors in the industrial equation vying with each other for success through measures of cooperation rather than conflict."

SCRAP PRICE DECLINE CHECKED

Pig Iron and Finished Steel Are Lower Than for Some Time Past

AVERAGE prices of heavy melting steel scrap at Chicago, Pittsburgh and Philadelphia have moved upward slightly from the low level of a month ago. November at $13.18 showed the lowest average for any month in several years, but December at $13.48 showed a recovery which was participated in by all three markets. It paralleled a similar, but short-lived, recovery in the third quarter. The average for the fourth quarter, however, at $13.38, was considerably lower than for any other quarter in more than five years. It compared with $14.09 in the second quarter of this year, and $13.73 in the third quarter. The average for the year was $14 a gross ton.

Pig iron reached in September the lowest level since before the United States entered the World War, and has gone still lower. The average composite price for December was $17.55, compared with $18.55 as recently as July. For the fourth quarter of the year, the average was $17.70.

Finished steel, while it has maintained a measurably uniform price for some months, was lower in November than in any month since 1922. The average was 2.299c. a lb., compared with 2.319c. for October and with 2.310c. for December.

After Declining Irregularly Since the Beginning of 1925, with Occasional Partial Recoveries, Scrap Prices Appear to Have Reached Bottom and to Be Headed Slowly Upward. Pig iron and finished steel have been falling during the same period, but much less abruptly

Japan a Growing Producer of Steel

Industry a Quarter Century Old Is Supplying More Than Half of Domestic Requirements in Finished Steel Products

BY GEORGE S. HERRICK

IN viewing the steel industry of Japan, it is perhaps well to bear in mind that, in contrast with the other steel producing nations of the world, it is a modern development by a people who have entered into an industrial era in comparatively recent times. Although the Imperial Government, convinced of the need of some domestic production of iron and steel, founded the Seitetsu Jo at Yawata in Kiushu (usually known as the Yawata or Imperial Steel Works) in 1896, a broad expansion of Japanese production did not occur until about the time of the Russo-Japanese war, 1904 to 1906.

Prior to the war with China, 1894 to 1895, production of iron was in a rather primitive state, with the total output probably not more than 5000 or 6000 tons a year. By 1896, however, it is estimated that Japan's consumption of pig iron was about 65,000 tons a year and of steel products more than 200,000 tons a year, of which only about 25,000 tons of pig iron and about 1000 tons of steel products were produced domestically.

Seitetsu Jo Leading Producer

The Seitetsu Jo (Imperial Steel Works) was established by Imperial edict in March, 1896, and construction began the following February, but it was not until almost four years later that the first blast furnace, with a capacity of about 160 tons a day, was blown in. Not until 1901 did the Government works enter into the production of steel. Under the original plans the plant was to have a capacity of 60,000 tons of finished materials a year, but before construction was completed the annual capacity had been increased to about 90,000 tons.

Proving of great benefit during the war with Russia, plans were immediately laid to increase the capacity of the works to about 180,000 tons a year, expansion for which was completed about 1909. There have been additional units completed since then, so that today it is claimed that the Seitetsu Jo has a total capacity of close to 1,000,000 tons of steel ingots annually.

In 1901, according to statistics recently published by the *Japan Advertiser*, the total production of pig iron in Japan was about 57,000 tons, of which the Seitetsu Jo at Yawata contributed about 30,000 tons. Of the total output of 6000 tons of steel in this year, the Government works produced about 5000 tons. In 1910 the Seitetsu Jo supplied about 129,000 tons of the total of 189,000 tons of pig iron produced and about 160,000 tons of the 168,000 tons of steel ingot output. Private enterprise was still of little consequence. By 1913, however, the total output of pig iron was 242,676 tons, of which the Government works' share was 179,000 tons, and the total production of steel was 254,952

EXCEPT for a Few Mills, the Steel Industry Is Grouped in Three Great Industrial Districts, About Yokohama, Kobe, and on the Island of Kiushu, Site of the Government Works. A steel works in Chosen and blast furnaces in Manchuria have been established and considerable expansion of these plants is planned tons, with the Government works contributing 216,000 tons.

As in the past, so today the Seitetsu Jo, representing a total investment by the Government of about 160,000,000 yen, is the leading steel interest in Japan by a considerable margin. According to the recent census (1925), the Government works employs more than 16,000 workmen on full time and about 6000 or more on part time. It has also about 12,500 miners, and the offices give employment to about 2200, including executives.

The principal products of the works, which is equipped with six blooming and billet mills, nine structural mills, one rail mill, three plate mills, two sheet mills, one wire rod and one bar mill, in addition to six blast furnaces, 29 open-hearth furnaces and two Talbot furnaces, are steel bars, plates and shapes, wire rods, rails in 12, 18, 20, 30, 45, 60, 75 and 91-lb. sections, steel axles and tires, universal plates, black and galvanized sheets, electrical sheets, tin plate and tool steel. Although the mills have equipment for the manufacture of pipes and tubes and wire, production has been suspended as an aid to private producers of these materials.

The Seitetsu Jo is the only producer of tin plate in Japan, with an annual capacity of about 250,000 base boxes. The first sales of tin plate were made in July, 1923, and in the following nine months, into March, 1924, 15,760 boxes per month were produced, of which it is reported that 65 per cent were primes, 34 per cent seconds and 1 per cent of lower grade.

The total investment in the steel industry of Japan is estimated at more than 400,000,000 yen, and as much as 500,000,000 yen, of which 160,000,000 yen or more is in the Government-owned mills of the Seitetsu Jo. While the valuation of the Government plant may be accepted as fair, as much cannot be said in all cases for privately owned companies, which have been overcapitalized. The companies, except for certain leading producers, are said to have over-valued their plant and equipment, and in many instances, during the war and post-war periods, to have borrowed money year after year from the banks to maintain dividends not warranted by the exceedingly small profits.

System of Subsidies to Steel Producers

A practice which has probably assisted to a great extent in bringing about the present unfortunate economic condition, which culminated in the failures and suspensions early this year, was the system of subsidies paid by the Government. Their object was to aid in the upbuilding of a steel industry which would tend to make Japan self-contained, produce greater industrialization to offset in part the rapid increase in population and at the same time contribute a valuable arm to the national defense.

The system is complex and extensive. In the main, private steel companies which are in a position to meet certain requirements are granted subsidies permitting a guaranteed dividend rate to shareholders.

Aided by these payments and as a result of the normal growth of a steel industry to supply part of the domestic demand, Japan is today producing black sheets of various gages, has a large galvanizing industry, and a fair output of bars and structural material, a rather large production of wire and wire nails, and a small tonnage of special materials, such as electrical steel sheets and tool steel. It is the purpose of the Government to make the country self-contained as far as possible in the production of steel, but, faced with a limited and poor iron ore supply and low-grade coal, this promises to be difficult of attainment.

Iron Ore Resources Limited

A report by the Department of Agriculture's soil bureau places the iron ore resources of Japan proper

Small tonnage of medium sizes only.		

at approximately 70,000,000 tons, including about 750,000 tons of sand ore. Estimating the demand for pig iron and finished steel in Japan at about 300,000 tons of pig iron and 1,680,000 tons of finished products annually, the following computation of iron ore requirements might be made: For the production of the 1,680,000 tons of finished steel, it is estimated that 2,350,000 tons of semi-finished material would be required, and this would necessitate the use of about 1,900,000 tons of pig iron in addition to scrap.

The production of such a quantity of pig iron would require approximately 3,800,000 tons of 50 per cent iron ore and about 2,000,000 tons of coke. Consumption of iron ore at the rate necessary for the estimated full requirements of Japan would soon exhaust the present known resources and in addition Japanese coal is said to be for the most part high in sulphur, phosphorus and ash content and highly volatile. At present the Seitetsu Jo at Yawata is importing its ore supplies from China and the South Sea Islands.

In 1925, in addition to the imports of pig iron from Manchuria and Chosen, of which about 100,000 tons came from the Anzan Steel Works of the South Manchuria Railway Co. and the Honkeiko Seitetsu Jo (Honkeiko Steel Corporation), also in Manchuria, and about 75,000 tons from the Mitsubishi Seitetsu Kaisha at Kenjiho, Chosen, about 150,000 tons of iron was imported from the Tata, Bengal and Burn interests in India, and 50,000 tons from the Hanyang Iron & Steel Works, Hankow, China.

While there is considerable iron ore in Manchuria, most of which is hematite, the percentage of iron content is not large, being generally about 36 to 40 per cent. It is, however, worked to advantage. One deposit is at Meaoerkou, about 24 miles from Penhsihu, the site of the Honkeiko Seitetsu Jo, and according to production figures of this operation for 1921, the total output was about 67,500 tons of ore. The other mine is at Anzan (Chinese: Anshanchan), the site of the South Manchuria Railway Co.'s Anzan Steel Works, and the production of iron ore in 1921 is given as 143,364 metric tons. Both deposits are of iron ore analyzing about 36, to as high as 40, per cent iron content.

Sand Ore May Be Used for Sponge Iron

The desire to extend the ore resources of the country as greatly as possible has led to a considerable development of interest in the Anderson-Thornhill process for production of iron from sand ores. Experiments have been carried out at the Kuji Seitetsu Jo (Kuji Steel Works), recently established in the northeastern part of Japan, and some success is claimed by the promoter, M. Matsukata, although the patentees of the process are far from satisfied.

Following an investigation by an engineer of the Imperial Trade Department, it was reported that the sponge iron made was found on analysis to contain

only about 80 per cent iron, while at least 90 per cent iron content would be required for successful working commercially. High cost of production is also a serious factor. Experiments, however, are being continued and satisfactory results are still expected by the Japanese promoters of the project.

Expansion After the War

Following the Armistice the industry was depressed, and to add to the troubles of the steel producers, came in 1921 the naval armament conference at Washington, with its restrictions on naval construction. Efforts to stabilize the industry and reduce competition met with little success, but in 1925 the Iron and Steel Association was organized, including as members the Seitetsu Jo of the Government and private companies. A pig iron sales organization was also established to control distribution. Subsidies to the steel makers were widely granted by the Government, and in 1926 a high tariff on iron and steel became effective as an added assistance to the industry.

Imports began to increase at this time and export trade suffered. It is estimated that about 65 per cent of the pig iron demand was supplied domestically in 1919, about 58 per cent in 1920, about 64 per cent in 1921, about 58 per cent in 1922, about 59 per cent in 1923, about 54 per cent in 1924 and about 64 per cent in 1925.

In steel bars and plates the percentage of domestic output to total consumption is estimated at about 36 per cent in 1920, about 50 per cent in 1921, about 40 per cent in 1922, about 54 per cent in 1923, about 46 per cent in 1924 and about 72 per cent in 1925. In recent years Japan has been an exporting as well as importing country in iron and steel. The total exports of pig iron and steel in 1924 were 860,691 piculs (51,295 gross tons), and in 1925, 911,204 piculs (54,306 gross tons).

Steel Mills, Blast Furnaces and Manufacturers in Japan

Seitetsu Jo (Known as Imperial or Yawata Steel Works), Yawata, Kiushu: wide range of steel products; 6 B. F., two 12-ton converters, 12 25-ton O. H., 17 60-ton O. H. and two 200-ton Talbot furnaces.

Nippon Seikojo (Japan Steel Works), Wanishi and Muroran in Hokkaido (Mitsui owned); pig iron and special steel; 4 B. F. and 12 O. H. fur.

Kamaishi Kozan Kaisha (also known as Kamaishi Tessan Kaisha), Kamaishi, Iwate prefecture; mining and steel company; pig iron, bars, shapes, special steel, cast iron pipe, ferromanganese and spiegeleisen; 3 B. F. and three 25-ton O. H. furnaces.

Nippon Kokan Kabushiki Kaisha (Japan Pipe Mfg. Co.), Kanagawa; pipe and special steel, pig iron, bars, shapes, rails and accessories; nine 25-ton O. H. furnaces.

Mitsubishi Seitetsu Kaisha (Mitsubishi Steel Co.), Kenjiho, Hokai-Do, Chosen; pig iron, steel bars, shapes and tubes; 2 B. F., three 50-ton O. H. furnaces.

Daido Denki-Sho (Daido Electric Steel Works), Nagoya, special and high speed steel, ferroalloys and steel castings.

Asano Zosen Sho (Asano Shipbuilding Co.) Tsurumi, Kanagawa; bars, shapes, wire products, castings and forgings; 1 B. F. and three 25-ton O. H. furnaces.

Kobe Seikojo (Kobe Steel Works), Kobe (formerly Suzuki owned); bars, shapes, plates, castings, forgings and special steel; 1 B. F. and four 20-ton O. H. furnaces.

Nippon Seiko-Sho (Japan Special Steel Works), Tokio; high carbon and high speed steel.

Osaka Teppan Seizo Kaisha Ltd. (Osaka Steel Sheet Mfg. Co.), Osaka and Tokuyama, (Iwai & Co., owned); sheets and steel plates; two 25-ton O. H. furnaces.

Takata Kogyo Kaisha (Takata Industrial Co.), Takata, Fukushima-Ken; pig iron and special quality steel.

Tokio Kozai Kaisha (Tokio Steel Materials Co.), Tokio; pig iron and special quality steel and art metal work.

Tobata Chuko-Sho, Ltd. (Tobata Cast Iron Works), Tobata, Fukuoka-Ken; pig iron and castings.

Toyo Seitetsu Kaisha (Oriental Steel Co.), Tobata, Fukuoka-Ken; pig iron, steel ingots and small shapes; 1 B. F. and small O. H. furnace.

Kawasaki Zosen-Sho (Kawasaki Dockyard Co.), Kobe; sheets, plates, bars, shapes, steel castings, forgings and special steel; eight 25-ton O. H. furnaces at Kobe and two 25-ton O. H. furnaces at Hyogo.

Osaka Seitetsu Kaisha (Osaka Steel Co.), Osaka; small sized shapes; four 20-ton O. H. furnaces.

Sumitomo Seitetsu-Jo (Sumitomo Steel Works), Osaka; rolled products and wire, tubes, castings, forgings and special ordnance work; three 25-ton O. H furnaces.

Anzan Seitetsu-Jo (Anzan Steel Works), Anzan (Chinese Anshanchan), Manchuria (South Manchuria Railway owned); pig iron; 2 B. F.

Osaka Tekko-Jo (Osaka Steel Works, Ltd.); shipbuilding and about 5000 tons of cast iron pipe annually.

Fuji Seiko Kaisha (Fuji Steel Works), Kawasaki; pig iron and special steel; small capacity blast furnace.

Yasuki-Seitetsu-Jo (Yasuki Steel Works), Yasuki, Shimane-Ken.

Kiso Denki Seitetsu Kaisha (Kiso Electric Steel Mfg. Co.), Nagoga; electric furnace steel castings; one 1½-ton electric furnace.

Kiushu Seitetsu Jo (Kiushu Steel Works), Wakamatsu; plates and shapes; three 30-ton O. H. furnaces.

Sumidagawa Seitetsu-Sho (Sumidagawa Steel Works), Tokio; pig iron; small capacity blast furnace.

Honkeiko Seitetsu Jo (Honkeiko Steel Corporation), Penhsihu, Manchuria; pig iron; 2 B. F.

Nippon Chuko-Sho (Japan Cast Iron Co.), Osaka; iron castings.

Nippon Seitetsu Kaisha (Japan Iron Mfg. Co.), Fukuoka Prefecture; pig iron; small capacity blast furnace.

Many Small Mills in Japan

Today there are in Japan 30 or more iron or steel producing companies in addition to the Seitetsu Joe of the Government, and numerous small manufacturers of special products, foundries, shipyards and similar plants. Of these there are 14 equipped with one or more rolling mills, including the Seitetsu Jo. There are five companies in Japan proper, with blast furnaces of 100 tons a day or more capacity, two in Manchuria and one in Chosen. There are three outstanding producers of sheets among these mills, and a fourth is reported entering into production. In all, there are 10 companies equipped with open-hearth furnaces of 25 tons capacity or larger, including the Seitetsu Jo and one company in Chosen, the Mitsubishi Seitetsu Kaisha at Kenjiho.

Sheet, Nail and Wire Capacity Expanded

In the past few years Japan has entered into an intensive development of wire drawing and nail making capacity, so that today, as shown in the accompanying table, there are more than 25 wire-drawing plants in Japan with a total capacity of 7110 tons of wire per month, and some of these and a few which purchase their wire in the open market bring the total of nail works to more than 60, with a total capacity of 94,220 kegs of nails per month.

Japanese efforts to establish a large sheet-rolling industry have created, perhaps, more interest in the United States and Great Britain than any other steel development effort of that country. The present rated capacity is more than 100,000 tons a year, although the actual output is considerably below this figure.

Japan remains a large consumer of light-gage black sheets, and in the past and today purchases practically all foreign requirements from the United States and Great Britain, with a limited tonnage from Germany. Great quantities of black sheets are consumed in Japan by the numerous galvanizing plants, the enameling industry and the makers of stoves and chimneys, as well as for building purposes.

Three Principal Sheet Producers

The first steel sheets rolled came from the Tokuyama mill of the Osaka Teppan Seizo Kaisha, Ltd. (Osaka Steel Sheet Mfg. Co.). This company, equipped with four stands of 28-in. rolls, 40 in. wide, prospered for several years. The company now has eight stands of rolls: two roughing, four finishing and two for cold rolling, producing heavy gages, 36 x 72 in. While the equipment can be used in rolling No. 30 gage black sheets, for which there is so much demand in Japan, none of this gage is being produced at present. The total capacity of the Tokuyama mill is placed at about 3000 tons of sheets a month, but operations are only 50 to 60 per cent of this capacity.

The Nippon Seitetsu Kogyo Kaisha (Japan Steel Industry Co.) at Yatsuya, Fukuoka prefecture, was a later arrival in the field of black sheet production, and is equipped with four stands of rolls, 26 in. in diameter by 40 in. wide; one roughing, two finishing and one for cold rolling. Sheets 36 in. wide up to 96 in. long can be rolled on this mill, and the gages range from Nos. 10 to 20. The total capacity is set at 1000 tons a month, but output is about 45 to 50 per cent of this maximum.

The greatest sheet producer, the Kawasaki Zosen-Sho, Ltd. (Kawasaki Dockyard Co.), following financial reverses in the spring during the near-panic, is reported to have temporarily suspended operation of all but its shipbuilding activities, but efforts are being made to have other large interests in Japan take over the operation of its various plants, and its idleness is generally considered to be only temporary. The equipment for sheet rolling at the Kawasaki plant consists of eight roughing, 13 finishing and seven cold rolling stands with 30 x 44-in. rolls. This company has made a definite effort to produce No. 30 gage black sheets profitably, and, according to report, some measure of success has been attained. One of the greatest obstacles to profitable operation is said to be the difficulty in securing Japanese workmen who can stand the temperatures.

Some Plants Established Before the War

Between 1901 and 1913 the Kamaishi Kozan Kaisha (Kamaishi Mining Co.) at Kamaishi, now owned by the Mitsui interests, was established. Originally it was exclusively a blast furnace company, but today, in addition to two 200-ton furnaces with a rated annual capacity of 130,000 tons of pig iron, it has three 25-ton open-hearth furnaces, as well as several smaller ones and a small-sized structural mill with an average rated capacity of 32,000 tons a year.

Another steel company established in this period was the Wanishi works at Wanishi, now a part of the Nippon Seikojo (Japan Steel Works), also owned by the Mitsui interests. This works employs about 4000 workmen and produces pig iron, forgings, ordnance and special steel. Its equipment includes three blast furnaces with a rated annual capacity of 100,000 tons.

Other companies established at this time were the Sumitomo Seiko-Sho, Ltd. (Sumitomo Steel Works), at Osaka, and which produces wire, tubes, castings, forgings and special steel, and is equipped with rolling mills for medium-sized structural shapes, wire rods and pipe. The total rated annual capacity of this company for rolled products is placed at 72,000 tons. The Nippon Kokan Kabushiki Kaisha (Japan Pipe Mfg. Co.) at Kanagawa, established prior to 1913, manufactures pipe, bars, shapes, rails and accessories, and special steel. It is equipped with the medium and small-sized structural mills and a pipe rolling mill. It has nine open-hearth furnaces of 25 tons capacity each, and an annual output rated at 135,000 tons of steel ingots.

Another of these early companies is the Kobe Seiko Jo (Kobe Steel Works) at Kobe, formerly controlled by Suzuki & Co. This mill produces bars, shapes, plates, castings, forgings and special steel. It has medium and small sized structural mills with an annual rated capacity of 37,000 tons, two 25-ton open-hearth furnaces rated with an annual output of 30,000 tons of steel ingots and one blast furnace of small capacity. The Kawasaki Zosen-Sho, Ltd., was also established in this period of expansion in the steel industry.

World War Brings More Development

After 1914, the beginning of the World War, each year saw a few new steel companies established. In 1915 the Sanyo Seitetsu Sho, Ltd., was organized under the control of Okura & Co., and the Kishimoto Seitetsu Jo and Kokura Seitetsu Jo (now Asano Zosen-Sho) were formed. In 1917 the Fuji Seiko Kaisha (Fuji Steel Co.) was built at Kawasaki to roll special steel. This plant is now equipped with a small structural mill rated at about 16,000 tons a year. Other companies established in 1917 were the Nippon Seiko-Sho (Japan Special Steel Works) at Tokio, to manufacture special quality steels; the Toyo Seitetsu Kabushiki Kaisha (Oriental Steel Mfg. Co.); Nippon Seiko-Sho (Japan Steel Works) at Wanishi and Muroran, and the Tobata Chuko-Sho, Ltd. (Tobata Cast Iron Co.) at Tobata, Fukuoka Prefecture.

Three large companies were organized in 1918, the Nippon Denki Kaisho (Japan Electric Co.) at Koriyama in Fukushima Prefecture, the Nagasaki Seitetsu Sho (Nagasaki Steel Works), and the Iwaura Seitetsu Sho (Iwaura Steel Works), but the coming of the armistice in November caused total suspension of plans for their establishment. At this period the total investment in private enterprises in the steel industry was more than 500,000,000 yen.

Plants Built in Manchuria and Chosen

From 1914 to 1918 the Japanese steel industry began to reach out into Chosen and Manchuria. The Honkeiko Seitetsu Jo, Penhsihu, Manchuria, controlled by Japanese and Chinese capital, was established on the site of a former coal-mining company as a result of the discovery of iron ore deposits at Miaoerku about 24 miles distant.

In this period, also, the Anzan Seitetsu Sho of the South Manchuria Railway Co. was under construction at Anzan (Chinese: Anshanchan). This plant did not go into operation until after the war. The Anzan plant has two blast furnaces with a capacity of 300 tons a day each, the total rated output per year being about 200,000 tons of pig iron. The present plans of the company call for expansion to an eventual capacity of about 1,000,000 tons of pig iron annually, and in accomplishment of this it has just been announced that projected blast furnace construction will increase output to 500,000 tons. The first blast furnace was blown in at the end of April, 1919; the second furnace, with about the same capacity, followed at the end of February, 1920. The works employs a total of about 2300 Japanese and Chinese workers, including officials. In establishing this plant, a new town, with roads, water and sewage disposal systems, was constructed.

In Chosen there is one outstanding steel company, the Mitsubishi Seitetsu Kaisha (Mitsubishi Steel Co.) at Kenjiho, controlled by the Mitsubishi interests. The beginning of this company was in 1911, when the Mitsubishi company purchased the iron ore mine at Kenjiho in Kokai-Do. In May, 1915, a foundry was built, and in 1918 the first blast furnace was completed. Additional construction has given this works two blast furnaces with a total annual output of about 100,000 tons of pig iron, three 50-ton open-hearth furnaces with an annual capacity of 100,000 tons of steel ingots and 50 Wilputte coke ovens with a total annual capacity of 166,000 tons of coke.

In considering the Japanese iron and steel industry it is essential to realize that at present it is largely composed of "potential" capacity. The mills are established and equipment is available, although in some cases it is not entirely modern nor in the best of condition. The actual production of this industry is on a considerably smaller scale, hampered by financial difficulties.

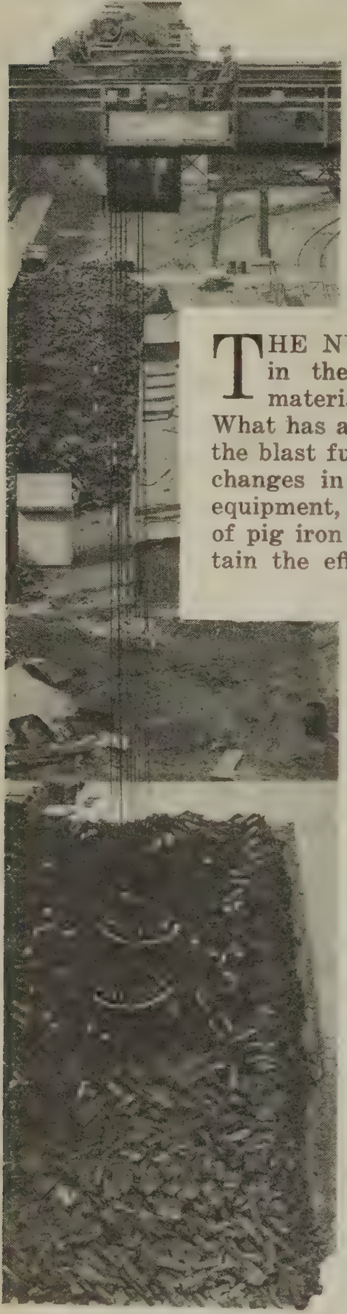
More Pig Iron, Better Pig Iron, Protective Freight Rates

The Common Problems of Merchant Furnaces and the Foundry Industry

BY E. J. LOWRY*



THE NUMBER of blast furnaces in the United States has not materially changed in 1927. What has assumed real importance to the blast furnace industry are certain changes in furnace construction and equipment, plus the fact that users of pig iron have determined to ascertain the effect of various factors on the quality of the pig iron they are buying.

Steep Inwalls Successful in South

As to changes in construction, the most apparent is on furnaces working on southern ores. Steeper inwalls, water-cooled, permit a more uniform stock distribution with corresponding gains in tonnage produced, lower coke ratios, and a better working furnace. The steeper inwall gives a relatively larger area at the top, thus increasing the area for charging. The additional stock which may thus be introduced acts as a recuperator on the hot gases, which in turn makes a direct saving on the fuel consumed. Stock is better distributed by this wider area when southern ores are used.

Progress may also be noted in the construction of new gas washers, which increase the overall thermal efficiency of the furnace. In combination with this there is a trend toward drying the blast furnace gases. It was shown at the meeting of the Iron and Steel Institute at Glasgow, Scotland, that the value of the gas is increased proportionately by the use of silica gel for drying the air. This conference seemed to agree that by this method the Gayley process would be considerably bettered, and even though in American practice the latter had fallen short, the silica gel process would prove of great advantage to the blast furnace operator.

Does Large Tonnage Mean Inferior Iron?

Changes in blast furnace construction are made in order to give greater and greater tonnages per square foot of hearth diameter without any ill effect upon the quality of the product. The great fear of the consumer is that large production means a sacrifice in the quality of the pig iron—whenever there is great production the consumer immediately feels that iron and steel scrap in some form must have been added to the burden. In fact this topic has formed the basis of animated meetings held by the American Institute of Mining and Metallurgical Engineers, and the American Foundrymen's Association. As the result of the latter meeting a resolution was passed inviting other societies to join with the American Foundrymen's Association in an attempt to find out just what pig iron should be and how it should be judged.

As a result of this resolution experiments are to be conducted at various blast furnaces to determine the influence of construction as well as the influence of the type of burden on the quality of the resulting pig iron. If these experiments lead to definite conclusions they will doubtless have a great effect not only upon the construction of blast furnaces, but upon the sale of pig iron to the consumer.

At the present time there is no technical method to determine *quality* in pig iron. It is purely a matter of experience which determines the applications of various pig irons. Melters generally are not prone to investigate the results of any changes in the materials entering their mixtures; consequently accumulation of information has been slow. However, the western foundrymen have as a rule become able to judge an iron reasonably well, and are willing to pay premiums for certain characteristics, whereas (as will be indicated later) the Easterners must still be initiated into the vagaries of pig iron.

Special Irons for Special Purposes

Apart from these changes to be anticipated in the future, there has been a decided change in the pig iron market recently. Southern iron no longer travels in large tonnage into northern territories. The South has become a considerable factor in the consumption of its own foundry iron. Since the introduction of the centrifugal process for pipe casting the South sometimes faces an apparent shortage in this raw material and buys tonnages from the neighboring northern furnaces. Some authorities ascribe this condition to the high freight rate from the South to the North which forced industries requiring southern irons to move South; others attribute it primarily to the invention of the centrifugal casting process. It is probably more nearly correct to say that the growing South has made markets which absorb most of the pig iron made in that district.

The development of the centrifugal process has undoubedly had its influence on the Southern pig iron market, and it will have further effects upon blast furnace operations, due to the fact that centrifugal casting requires low carbon irons. Blast furnace men will be forced to find a way to meet the requirements of this situation. Inasmuch as there are English and German furnaces operating on this type of product it is reasonable to suppose that some American furnaces will accede to the demands. Other casting processes require high carbon irons from the blast furnaces. Thus it would seem that pig iron production will become a specialty and the energetic producer will naturally meet the specifications of his consumers. This trend is clearly shown in New York State, where certain furnaces have found that by sintering the ore they have been able to meet the requirements of the most exacting consumer. The same careful preparation of materials entering the burden, as well as unique furnace operation, has shown that furnaces in the Cleveland and

---

*Consulting metallurgist for Hickman, Williams & Co. and Witherbee-Sherman & Co.

E. J. LOWRY Is Well Known to Men in Iron Foundries, Since He Travels Almost Constantly, Advising His Firm's Customers on Their Troubles Ascribed to Pig Iron. He is an active member of the Mining Engineers, Steel Treaters, Foundrymen's and Society for Testing Materials. His foundry experience was at Watertown Arsenal and the Oliver Chilled Plow Works.

Chicago districts can well adapt their conditions to meet the requirements of the melter.

In New England the influence of brand names is fast passing. Where five years ago a buyer must know the brand and origin of a pig iron, today he is more keenly interested in the delivered price. In many instances he has gone to an extreme, just as the West had done five years before. It will perhaps take five years for the New Englander to become accustomed to do as his Western brother does, namely, to pay a premium for quality where it is justly deserved.

Slightly More Charcoal Iron Sold

Consumption of charcoal iron during 1927 will be found to be equal to that of 1926, if not greater. While the Charcoal Iron Co. of America passed into receivership, this had been anticipated, so there was no reaction felt in the market. Larger tonnage is estimated as the basis that the Wrigley charcoal iron furnace has been able to maintain operations continuously during 1927, as against an approximate six months' operation previously.

There is a growing tendency for foundry metallurgists to use charcoal iron in the production of fine castings.

High test cast iron will also have considerable effect upon the industry. Whereas cast irons of 28,000 lb. tensile strength were exceptional in past years, proper manipulation of materials has produced irons with strengths as high as 60,000 lb. Such high strength materials will be useful to the constructor and designer of modern machinery, and will enable the foundry industry to recover some of the market lost to rolled and forged steel. There is also the possibility that alloy cast iron will change the status of the foundries in this country.

Freight Rates Have Profound Influence on Furnace Activities

The freight rate structure on pig irons throughout the entire country is being contested. Furnaces in each district feel that they should have greater advantage when shipping to other districts, while those within such districts wish to prevent greater competition. The consumer, however, is hoping for this competition and wishes that greater tonnages were available for his selection.

This matter is of nation-wide importance because of its economic hearing on the world's largest industry. At times it may be forgotten that freight rates are a protection for furnaces within particular districts, which furnaces might otherwise be at a disadvantage owing to individual costs of production. During the past year the high-cost furnaces have been excluded from operation, but the medium-cost and low-cost furnaces have been fighting for business; without freight rate advantage the medium-cost furnace must necessarily have blown out.

On the other hand, the gray iron and malleable industries are well within their rights in demanding competition among pig iron producers. These branches of the foundry industry have not progressed within the last three years, mainly because of their operating costs. In order to meet competition from within and from without they have been forced to sacrifice earnings to keep in operation. Consequently they feel that a reduction in the delivered cost of raw materials might result in giving them a small profit. They now take business at cost or below, and try to break even or show a profit by using cheaper grade materials. Ultimately the engineer or the consumer finds that the product is inferior and discards it for forgings, stampings or some other material; the end result is that the foundry makes fewer castings, and the merchant furnace sells less pig iron.

A happy solution of the problem would be to district the country, and proportion freight rates to the distance in the districts, but this becomes an obvious impossibility when market conditions in each district vary with the supply and demand. The only agreeable outcome will follow when the consumer of pig iron sees that his object is the same as that of the producer. Their position is a common one, but neither has grown to understand the other's predicament.

Better Marketing Is Steel Need

Steel Sales Executives Discuss Impediments Encountered in Selling of Products at a Profit Commensurate With Large Capital Invested and Importance of the Industry

SEVERAL MEN prominently identified with the selling of steel have contributed to this issue, on invitation of THE IRON AGE, their views on the difficulties encountered in the marketing of steel products. Entirely aside from the ever-present operation of the supply and demand balance, it is frequently pointed out that there are many competitive ills for which a solution should be, but has not yet been, found. Some of the questions which our contributors discuss include:

Is the present form of steel contract a cause of market irregularity?

Would the situation be improved if steel were sold for specific requirements only?

Are the concessions usually granted to the large buyer an undermining influence on price structures?

If such concessions have become a fixed policy with many steel companies, what is the best method of handling the small buyer who often regards his tonnage as more important than do the mills and demands the lowest going price?

How can less-than-carload orders best be handled?

The problem stated in the last of the foregoing questions is now undergoing a test of the application of extras for small quantities, such as have been adopted by manufacturers of hot rolled bars, cold finished steel bars, wire nails and cold rolled strip steel. But not much progress has been made in solving some of the other problems of steel marketing, and, in the opinion of the president of an independent steel company, there is little hope of steadying the steel products market "until the steel fraternity learns that it does not pay for individuals to try to get more than their share of the business in slack times by cutting under and making unwarranted concessions in prices or terms."

"Let sales policies and prices recognize the right of the stockholder to a return on his money," says another commentator in reply to THE IRON AGE's inquiry, while still another points out that it is the scramble for the extra 10 per cent of unprofitable tonnage that "becomes a formidable menace to the entire business." He adds: "Find a market for the surplus at a price which allows a profit and the solution of the problem will be close at hand."

Comments received by THE IRON AGE are in disagreement upon some of the issues raised, but all agree that there is a problem which demands wiser sales policies if steel production is to be placed on a basis of profit commensurate with the large capital invested and the importance of the industry. The comments which follow include a letter from the purchasing agent of a company which is a large steel consumer.

Laxity Has Developed in the Merchandising of Steel

"THE desire to bring about consideration of the difficulties in the matter of marketing steel products is certainly entitled to the support and careful consideration of all producers. There has developed a laxity in our merchandising that is to be deplored, and we have educated buyers to the point of freedom in consideration of any obligation that they may have to us as producers that makes the marketing of steel products something of a joke, if it were not so serious.

"Our problems, like all other problems, can be solved by going at them in the right way and with the right disposition. I could bring up a number of objectionable methods that should be eliminated, but they are only incidental. The real solution is this—we have brains in the steel business, unquestionably, otherwise the industry would not be of the size and caliber that it is; when the executives who control this industry start out earnestly and sincerely to merchandise steel products in a sound, legitimate way, that will guarantee a reasonable and regular profit, then it will not take long to put the industry on a basis just as efficient in the selling end as now exists in the operating end.

"The reason that we have been consistently becoming worse and earnings have been going down is because the big problems in steel merchandising have not had the attention and consideration of the executives, as have matters of finance, operation, transportation, etc. I am hopeful that the time is almost at hand when the situation will be improved, because the earnings in the steel business have become a matter of unfavorable comment, not only with our stockholders but with our bankers, and even with our customers."

Rights of Stockholders to Fair Return Have Been Ignored

"THE usual excuse for the sale of steel at or near its producing costs and sometimes below is that it is one of the economic evils growing out of the fact that the country's consumptive power is not yet equal to its productive capacity. I sometimes wonder if that is the whole story. Having been trained to the belief that the first obligation of every sales executive is to the stockholders of his company, who have provided the capital for the conduct of the business of the company and actually have made the management, including the manager of sales, a trustee of the investment, I cannot escape the conclusion that the query, 'What is wrong with steel selling?' is partly at least answered by the fact that the rights of the stockholders to a fair return have been ignored.

"There may be justification at times for the acceptance of a particular piece of business at a price that does not more than bring in a new dollar for an old one. It is costly these days to keep modern steel mill equipment idle, and getting an order that will provide at least partial operation may justify a temporary concession, especially if the concession means less loss than would be entailed in complete suspension. But when profitless business continues to be taken, then it is time for the directors to make an investigation of the sales department.

"There is nothing particularly new in the condition that the productive capacity of the country exceeds its ability to consume steel; not only has that been true for the past six years, but short range buying which developed with the ability of the manufacturers to make prompt shipments at extremely short notice also has been a condition long enough for us to have accustomed and adjusted our sales habits to it. Though steel manufacturers have been laboring under this handicap for three or four years, practically no attempt has been made to add the extra cost of doing business in this fashion to the sales price. In other words, mills are transacting a jobbing business, which is forced upon them, without the remuneration which the jobber would demand for the same effort and service. Let sales policies and prices recognize rights of the stockholder to a return on his money and whether or not the country can make more steel than it can use will cease to have its unnerving effect upon sales managers and salesmen."

Says Contracts Should Be Fixed Both As to Price and Tonnage

"UNTIL the steel fraternity learns that it does not pay for the individuals to try to get more than their share of the business in slack times by cutting under and making unwarrantable concessions in prices or terms, I see no particular hope of steadying the steel products market.

"The present tendency to sell for periods of three months is a favorable factor in the marketing situation, as a consuming company ought to be able to measure its business with reasonable accuracy for such a period in advance. The inability to measure business conditions is the only excuse I know of for the instability of prices made and agreed upon between producer and consumer.

"There come times with certain companies that have to manufacture for long forward delivery and before conditions surrounding consumption have been determined that have led to the habit of period contracts, the only limitations being requirements, so as to enable the buyer to shift the burden to the seller by ordering very modestly if his business drops off and very heavily if his business improves unexpectedly or if the market price of the commodity he is buying advances.

"It would seem to be reasonable to expect that quarterly agreements be maintained at a fixed price and tonnage agreed upon just as securely as pig iron sales are maintained in both these respects.

"If there are occasions where the price of raw material for manufacture covering a long period is necessary to the buyer in order for him to be sure of his costs for future delivery and he therefore asks for a season's requirements, he should be compelled to divide the responsibility with the seller and state a minimum which he would under any circumstances take, with only a reasonable spread to a maximum which he might specify and receive if his business demanded.

"At the present time the favorable factor is the tendency toward short period agreements, which should more frequently than is now the case carry exact tonnage statements; and the unfavorable factor is the effort of certain producers to get more than their reasonable proportion of available business as related to their productive capacity, which results in demoralizing the market."

Firm or Binding Contracts Would Improve Steel Situation

"THERE is nothing wrong with the present form of steel contract; there is much wrong with the execution and enforcement of the contract. In a weak or declining market the average buyer at best considers the contract in the nature of an option and if he specifies or takes out the tonnage agreed upon he forces the seller to meet conditions or prices that did not exist when the contract was made; on the other hand, in a strong or advancing market the seller does not always religiously fulfill his agreement, and it is common knowledge that sellers often give preference to the higher priced or more desirable business. Both of these practices are unethical if not contrary to law but one will continue as long as the other.

"Under a firm or binding contract the situation would be much improved because contracts would be made only for specific requirements, or if made speculatively both parties would be prepared to take their loss as well as their gain. This is true in business generally, so it could be made to apply to steel contracts.

"It is the history of all business that is not controlled by statute as to its price or rate making that large or otherwise very desirable buyers usually obtain concessions which do not truly reflect what is commonly called the market price. It is my personal observation that the Class B buyer who aspires to be favored on a Class A basis is equally averse to having a Class C buyer placed upon the Class B basis. Such being the case, the only real solution is concerted action in the industry with classification and agreement as to the status of all buyers. This may be illegal under our present laws but if the practice is not followed openly it is followed in actual fact, and it is quite generally a recognized if not fixed policy.

"If concessions to the large buyer have become a fixed policy in the steel trade it is difficult to say what

is the best method of handling the small buyer who frequently regards his tonnage as more important than do the mills and demands the lowest going price. One who may be a small buyer to one seller may be considered of prime importance to another seller, and, in the absence of a price controlled market, difference of opinion will manifest itself most forcibly in distinction and discrimination in the classification and handling of all substantial buyers.

"In the handling of less-than-carload orders by the mills, it is not consistent to ship such orders at carload prices because of the additional expense and inconvenience involved. As to the question of less-than-carload shipment either by direct sales by mills or for the account of jobbing customers, the answer can be found only by cooperation between the mills and their customers. As an example I understand that steel pipe is rarely shipped from the mills in less than carload lots simply because the practice of carload shipments is established and is not deviated from on the slightest pretext as does occur in sheets, nails and other lines.

"In a general way the solution of any business problem lies within the industry itself, by which I mean both buyers and sellers, by cooperation on the part of all concerned, good faith in every transaction, with condemnation if not prosecution for violations of contract and unfair dealing. Let the buyer and seller both understand the nature of an obligation and then live up to it honestly."

Small-Lot Sales by Mills Blamed for Some of Industry's Ills

"THE major ills of the steel industry might be summed up in the one statement that we have 34,000,000 tons annual production of rolled products where 31,000,000 tons would suffice. The excess 3,000,000 tons must be "dumped" at a profitless price with the consequent disturbance of all price structures. Find a market for the surplus at a price which allows a profit and the solution of the problem will be close at hand.

"Under ordinary conditions approximately 80 per cent of any one year's production is actually bought for current consumption, and little effort is needed for its sale. Approximately 10 per cent is keenly negotiated for by both buyer and seller, the advantage shifting from one to the other as the immediate requirements of buyer or mill might dictate.

"The remaining 10 per cent, forced upon the sales department by the ambition of the operating department to hang up a new production record, becomes a formidable menace to the entire business. Almost frantic efforts are made to dispose of it. Numerous inexperienced salesmen are sent out to solicit from the smallest consumer, who will buy only as much as the particular job in hand requires. Frequently several such orders will total a scant carload, with the consequent higher cost of handling at the mill.

"At the risk of being classed as reactionary, I might suggest that the mills are not cooperating properly with the warehouses and distributers. Perhaps such cooperation holds the solution.

"These distributers are credited with handling about 10 per cent of the output of finished steel, or in the neighborhood of 3,000,000 tons annually. Assuming this amount of tonnage is sold from warehouse stock, it means a turnover of a stock of 1,000,000 tons three times a year. Stocks are always replenished and never completely depleted. Holding the stock in warehouses actually removes it from the market. Due largely to direct mill competition, warehouses today are carrying from 25 per cent to 50 per cent less stock than they have carried heretofore. This decreases their purchasing power, and affects directly the tonnage which might move in double-car shipments to warehouses. The mills are losing two to three tons of this desirable business for every one ton they are gaining from the small buyer, who should buy from warehouse.

"The steel industry as now organized and equipped should give careful thought to the question of retailing their surplus production. Perhaps it will be found expedient to abandon such retailing and turn it over to warehouses properly equipped to handle it, or they might find it desirable to equip their yards so as to handle such business on a profitable basis.

"When proper realinement of this question of mill and warehouse is effected, and when greater attention is given to executive sales effort, instead of the present method of getting an order by quoting or cutting prices and promising delivery, two great wrongs in the general plan of steel selling will be corrected."

Concessions to Large Buyers Soon Reflected in All Sales

"WHATEVER overproduction there is in steel plates is due to the fact that the mills in the East were equipped to take care of shipbuilding. The war put this out of business and consequently 50 per cent of our tonnage is gone. Nothing has ever come up to take its place, so you see it is not the mills' fault that there is over-capacity.

"If there is anything wrong with steel plate selling it is because there is so much competition. This is a direct result of the situation stated above.

"The present form of steel plate contract is a pernicious influence because it is nothing more than an option. In other lines of trade, such as pig iron, etc., a contract is a contract.

"The situation would be improved if steel were sold only for specific requirements. This, however, can be done only with those who use large quantities. The small buyer cannot write in and ask for a price every time he wants to buy 10 tons.

"Concessions granted to anyone are an undermining influence on price structures. It is such prices as these that get into the trade papers and which make the other buyers hammer the seller until they get the lower price. The writer does not believe that a special concession given to some buyer for a special reason is a market. It is not the market, but today a special concession in a very short time becomes the market. The small tonnage is just as important to the small buyer, and possibly more so than the special tonnage to the large buyer. I do not know how this is going to be corrected."

No Price Recognition of More Exacting Steel Specifications

"THE great error in steel selling, as I view it, is that there has been no recognition of the fact that since 1921 the industry has been making not steel the commodity, but steel the product, into which goes not merely the raw materials but all the expenditures of many years in research, experimentation and investigation that the finished product may do everything it was intended to do by those who have formulated the specifications.

"As is very well known, a large percentage of the total production of steel today is made to specifications. With machinery doing the work formerly performed by hand; with mass production the common practice of large steel consuming industries, there can be no deviations from the specifications as written by the engineers and metallurgists of these industries. The automobile manufacturer cannot afford to put a model upon the market that may come back upon his hands because the fender has yielded to the road shocks of the car in operation or the car develops other weaknesses because the steel has fallen below specifications. No longer can random lengths of bars or sheets of dimensions in excess of the design be shipped to automobile builders. There must be uniformity of length of bars and of sheet dimensions that they may go through machines and create no scrap waste.

"The steel industry has willingly met these and other precise exactions of consumers, but seemingly has overlooked in its drive toward big production and its efforts to please, that precision is expensive when allowable variations in chemical and physical properties have constantly been more finely drawn. Indeed, it seems that the mistake has been that the steel industry sales policies still are dominated by the customs in vogue when the manufacture of steel was a rule of thumb proposition rather than a very exacting science as it is today. We are definitely beyond the period when steel was sold according to whether it was hard, mild or soft, and we have got down to quarter fractions of these divisions and even smaller divisions on allowable tolerances. The cost of these reduced limits on both chemical and physical properties has not been passed on to the ultimate consumer, but has been absorbed by the manufacturers in their desire to get tonnage until the difference between red and black figures is almost as minute as the tolerances."

From a General Sales Manager

"I HAVE read an article in THE IRON AGE, issue of Nov. 24, by Saunders Norvell, president Remington Arms Co., which seems to touch some of the vital points in a general sales policy, and much of this article might be applied to the selling of steel. It is interesting to note what Mr. Norvell has to say under the head, 'Selling policies call for hard thinking higher up.'"

Steel Plate Contract Has Become Only a Loose Protection

"THE present steel plate contract is very unfavorable to the seller and it really means nothing more or less than a protection to the buyer. It is a hard matter, however, to get away from it, inasmuch as steel plates are very seldom stocked in any quantity, since carrying stock would entail a great deal more waste in preparing for fabricated jobs than there would be in the case of bars or structurals.

"It does seem funny that pig iron is contracted for as an absolute sale, but for years the plate contract has been nothing more or less than a loose protection and we certainly would welcome any move which would tend to change this situation.

"It is always possible to sell steel for specific requirements, but the unfortunate thing in connection with this is that in order to bid a man must know exactly what his material is going to cost him and, to the writer's knowledge, the matter of protection along these lines has been very much abused. The buyer may secure a protection on a certain tonnage to cover a particular job and then if he does not get this job but gets a few smaller ones, he can apply such tonnage against the protection granted, particularly if he has a very elastic conscience.

"As regards the small buyer, it undoubtedly costs the mills a lot more money to handle their business, but from the time hand-to-mouth buying originated, there has been such a scarcity of orders that there has been no trouble whatever for the smaller buyers to secure as good a price as we would quote the average large buyer. The one thing that we cannot condone is the fact that some of the larger companies insist on selling the car companies and others of that size at a price under the market at all times, and then these companies use the same prices in purchasing steel for uses other than cars.

"We feel that the less-carload business should be handled on a higher base than carload business.

"The writer recalls that during the war an executive of one of the largest companies in the country decided that he would see to it that a contract was made a contract and not simply a loose protection, but even in a period of such strenuous demand as we went through from 1915 to 1918, the steel contract continued to remain the same as it had previously been and unfortunately the same as it is today."

Problems of the Buyer Should Be Considered in Sales Policies

BY A PURCHASING AGENT

"THE present form of steel contract seems to be based on an appreciation of the problems confronting the industrial buyer at the present time, whereby he is unable to anticipate specific requirements any appreciable distance into the future. This situation is determined by the selling conditions which confront the organization of the industrial buyer and characterized by the attitude of the consumer who insists upon immediate or prompt delivery of the finished product.

"This attitude of the consumer is one phase of the prevailing policy of short term buying which has been opposed more stubbornly by the steel manufacturers than perhaps any other industry. I do not believe that the steel manufacturers can escape the disadvantages of short term buying any more than can any other lines of industry, and the present form of contract is in effect a recognition of this situation.

"The concessions granted the large buyer are a recognition of the fact that large volume purchases are entitled to better terms than the small-lot purchases. This is generally recognized in industry as being sound in principle and should not be an undermining influence on price structures. The fact that concessions to which the large buyer is legitimately entitled are sometimes extended to the small-lot buyer is not an argument against the plan of concessions to the large buyer, but rather an indictment of the selling methods of the steel industry.

"The question 'What is the best method of handling the small buyer' has apparently been taken in hand by the steel companies recently, as evidenced by the publication of differentials against small-lot orders.

"It is impossible to consider the question of selling methods as a matter distinct and apart by itself. The question of selling methods is involved with the other policies of the steel companies, such as their financial and manufacturing policies, and must reflect to a great degree the situation which obtains in these other departments of the steel organizations.

Buyer's Conditions Not Always Met

"To my mind the greatest handicap which the industrial buyer confronts in dealing with the steel manufacturers is their refusal to recognize the conditions which obtain in the industrial field whereby it is impossible in most cases to foretell specific requirements. The buyer insists that he must have immediate delivery of his requirements and the steel mill replies by sending out a printed schedule of rollings and expects the buyer to accommodate his necessities to the convenience of the mill.

"Compare, if you will, the service which a buyer purchasing equally large quantities of magnet wire and steel will receive on these two commodities. In the case of the first item, he may arrange with the manufacturer to obtain his varying specifications from mill stock and at mill prices in approximately one-third the time required to obtain his steel specifications from the steel mill. In the one case the manufacturer will maintain ample stocks of the specifications which his customers ordinarily use and is prepared to furnish these promptly. The steel mill, however, persists in bringing up the question of rolling schedules and puts the burden of getting delivery upon the industrial buyer.

"At the present time the steel mills are giving unusual service on mill shipments, due to the fact that competition has shown them the wisdom of so doing. It seems entirely probable, however, that as soon as large volumes of business are available and the order books are reasonably well filled up that they will again be quoting rolling schedules to the industrial buyer rather than making a sincere effort to procure for him the deliveries which his situation requires.

"I should like to call to your attention also the propaganda appearing in some trade publications attempting to force the industrial buyer into the hands of the steel warehouse. If they are successful in this propaganda the buyer will be forced to obtain a large portion of his requirements from warehouse stocks at a considerably increased cost. I believe that these publications owe the industrial buyer an explanation of their attitude on this question.

"As to whether a steel contract should constitute a firm sale, the statement is made that in copper, brass, lead, zinc and other non-ferrous metals all sales are firm sales. This, in my opinion, is only partially true. As a matter of fact, the dealers in the non-ferrous lines and in pig iron are found to be as considerate and willing to extend cooperation to the buyer as in any other line. I have yet to learn where buyers have been forced to take material on such contracts where it is not to the best interests of both parties concerned to do so.

"Steel industries, perhaps more than any other, are complaining of the results of present competitive conditions, although I know of no reason why they should expect to be exempt from the effects of such conditions any more than other basic industries.

"No doubt the managements directing the affairs of the steel manufacturers, characterized as they are by the greatest ability, are studying all ways and means of meeting this situation. It seems to me it would be more helpful to direct their attention to a study of the buyer's situation, and I speak especially of the industrial buyer, and endeavor to cooperate with him and assist in meeting the conditions with which he is confronted, rather than to attempt to make his situation more difficult by more stringent contract regulations, insisting that he wait on rolling schedules or forcing him into the hands of the steel warehouse."

Exports and Imports of Metal Products

Iron and Steel Most Important in Exports, but Only One-Ninth of the Imports, Which Are Dominated by Non-Ferrous Metals

BASED on dollar values exports from the United States of iron and steel products for the first seven months of 1927, at $146,151,000 represent about seven times the imports, which aggregated $21,519,000. These figures, together with those for non-ferrous metals, are shown in the table, which gives also corresponding comparisons for 1926. It will be noted that the export movement this year has increased about 6 per cent over last year, nearly all of the gain having been in non-ferrous metals. The import movement has fallen below last year to the extent of more than 8 per cent, about half the drop having occurred in non-ferrous metals.

Semi-manufactures of iron and steel covered by the Department of Commerce compilation include pig iron, scrap, semi-finished steel, bars and rods, plates, sheets, including galvanized, strip steel, tin plate, etc. Manufactures of iron and steel include beams, fabricated plates, metal lath, rails and joints, pipe and tubes and fittings, including cast iron pipe, wire and its manufactures, nails, bolts, etc., and castings and forgings. Advanced manufactures include cutlery, hollowware, enameled ware, metal furniture and fixtures, stoves and furnaces, tools (cutting and other), hardware (builders' and others), chains, needles, scales and balances, screws, etc.

Of the non-ferrous exports, about two-thirds in each year was represented by copper. Of the non-ferrous imports the largest item, which covered about 40 per cent, was in tin bars, blocks and pig. More than two-thirds of the remainder consists of copper, mostly in the unrefined state, including ores and concentrates. Aluminum metal, scrap and alloy accounted each year for about 7 per cent of the non-ferrous imports and lead, mostly the ore, for a like quantity.

UNITED STATES EXPORTS AND IMPORTS OF METALS AND METAL MANUFACTURES
(In Thousands of Dollars)

	Exports		Imports	
	1927†	1926	1927†	1926
Iron ore	1,587	1,465	3,646	3,368
Iron and steel:				
Semi-manufactures	56,114	50,686	6,073	11,129
Manufactures	45,427	48,103	11,779	9,880
Advanced manufactures	44,610	44,694	3,667	3,869
Ferroalloys	590	461	9,243	13,857
Non-ferrous metals*	125,060	113,436	151,269	160,702
Total	273,388	258,845	185,677	202,805

*Not including precious metals.
†Seven months ended July 31.

Excess of Iron and Steel Exports Over Imports Is Shown Above the Zero Line, Total Imports Being Below and Total Exports the Entire Height of Each Column

New Records Last Year in World Iron and Steel Output

Iron at 84 Million Tons Exceeds Pre-War for First Time—Steel Reaches 98 Million—Expansion in Europe a Feature —American Proportion Falls

TWO new records were made last year by the world's iron and steel industry. For the first time since the war, pig iron production exceeded that of 1913. At 84,280,000 gross tons it was about 8.5 per cent in excess of the 77,720,000 tons made just before the war. Steel output rose to 98,200,000 tons or 7 per cent larger than the best previous record in 1926 of 91,790,000 tons.

The feature of these records is that they were made in spite of the fact that the American output of both pig iron and steel fell below that of 1925 and 1926.

Exports of the leading nations also made a new record last year, exceeding for the second time the pre-war volume.

European Recovery Chief Cause of Expansion in Output

GRADUAL recovery of the European steel industry from the effects of the war is the feature of an analysis of figures compiled for the world's pig iron and steel output. Based on data published and furnished by the National Federation of Iron and Steel Manufacturers of London, England, as found in the accompanying tables, the pig iron and steel production of 21 countries reached new heights.

With estimates made for the last month or two for the leading producing countries, the world's estimated pig iron output was about 84,280,000 gross tons, exceeding for the first time the 77,720,000 tons made in 1913. It was also 8.5 per cent more than the 77,670,000 tons made in 1926, which just fell short of the pre-war production.

In steel a new world record was easily achieved—approximately 98,200,000 tons or about 7 per cent larger than the 91,790,000 tons made in 1926 which was a record. The strides made in steel are demonstrated when it is realized that the 1927 steel production is about 31 per cent larger than the pre-war or 1913 output of 74,830,000.

More Steel and Iron Made in Europe

If the record of the five leading European countries —Great Britain, Germany, France, Belgium and Luxemburg—is studied, it will be found that the expansion in 1927 over 1926 was notable. In pig iron these countries are credited with 35,670,000 tons last year against 27,110,000 tons in 1926, a gain of nearly 32 per cent. In steel the same countries made 38,410,000 tons last year as compared with 29,580,000 tons in 1926, an expansion of about 30 per cent.

Taking all European countries, both the pig iron and steel output was approximately 10,000,000 tons larger than in 1926. Pig iron last year at 44,220,000 tons was 52 per cent and steel at 50,110,000 tons was 51 per cent of world total.

Outstanding in this expansion is the record of Germany and Great Britain. The forward strides of Germany last year were notable and surpass those of any other country. Both pig iron and steel production in 1927 increased from 30 to 35 per cent over the 1926 volume.

In Great Britain the recovery from the poor record of 1926 has been due to the settlement of the coal strike which nearly paralyzed the industry in 1926. Even at that, the showing is not strikingly better than in some years since the war.

In judging the European recovery as a whole, mention should be made of Russia. In that country rapid progress has been made so that the output of both pig

---

*Partly estimated. Lorraine's output is included in Germany's in 1913, but in that of France since 1918.

iron and steel in the last two years, and particularly in 1927, has reached about 75 per cent of the pre-war or 1913 volume.

France, Belgium and Luxemburg just about maintained last year, as a whole, the rates achieved in 1926.

American Outputs Fall Off

In the United States no new records were made. Conditions are reviewed in some detail on other pages. In pig iron, with an estimated output of about 36,400,000 tons last year the American total was about 43.3 per cent of the world total as compared with 50.7 per cent in 1926. In steel the probable 1927 output of 44,500,000 tons was about 45.3 per cent of the world total as against 52.9 per cent in 1926.

A tendency which has been quite marked since the war—the production of more steel than pig iron—is again a feature this year. In 1913 world pig iron production exceeded steel by 2,890,000 tons. In 1927 steel surpassed pig iron by 3,920,000 tons.

Table of Steel Exports and Imports of Leading Countries in Millions of Gross Tons

*Partly estimated. Luxemburg included in Belgian total.

World Using More Steel, Exports Indicate

JUDGED by the exports of the six principal steel exporting nations, world consumption of steel attained a record volume in 1927. For the second time since the war the total was larger than that of 1913. One of the tables gives the details. At 20,590,000 tons world exports exceeded those of 1926 by 2,880,000 tons or 16 per cent. Compared with 1913 the 1927 total was 4,400,000 tons, or nearly 27 per cent larger.

Imports into these six countries were the largest last year ever recorded at 8,060,000 tons, easily exceeding those of 1925 and 1926 and over twice the total of 3,820,000 tons in 1913. Scrap is not included in these data.

The significant feature of the data is the fact that the excess of exports over imports of 12,530,000 tons in 1927 closely approximates the excess of 12,370,000 tons which prevailed in 1913. This would seem to indicate that the world's consumption of steel, particularly that of the non-producing nations, is now more nearly normal than at any time since the war.

One or two trends in both the exports and imports are worthy of mention. The commanding position of France as an exporter is notable—at 5,670,000 tons last year her foreign trade was nearly tenfold that of 1913 and easily led all other nations. Belgium's expansion was large last year and the British industry recovered from the effect of the 1926 coal strike. American exports were the smallest and are still less than before the war.

In imports the heavy inflow into Germany last year and the constant growth in the British receipts are prominent.

The 1927 record of both exports and imports evidently points to a greater interchange among all nations and a healthier economic condition the world over.

Coal Trade Depressed by Large Stocks and Low Demands

Strike of Union Miners Has Caused Scarcely a Ripple and Indications Point to Further Inroads on Organization's Strength

BY A COAL TRADE AUTHORITY

ABNORMALLY large stocks in the hands of consumers and a notable falling off in industrial demand combined to depress the bituminous coal market at the close of 1927 almost to the point of demoralization. The unusual situation with regard to stocks is the result of the extraordinary reserves built up in the first quarter in preparation for a nation-wide strike of union soft coal mine workers and the failure of the strike to produce the expected coal shortage.

The Government estimated that 75,000,000 tons of coal were in consumers' storage piles when the strike was called and reported more than 60,000,000 tons as yet in reserve on Oct. 1. The strike caused hardly a ripple in the coal market, and throughout the year demand, not labor, was the factor limiting coal production. Non-union output has steadily gained in volume as one area after another cast off the union and put its production on a competitive basis with the great open-shop fields of the South.

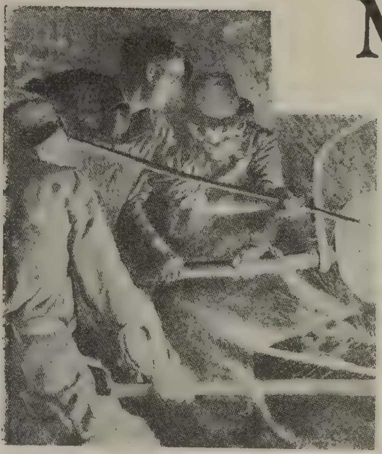
Western Pennsylvania followed northern West Virginia. Central Pennsylvania and Ohio were the next large fields to declare for the open shop and wages below the Jacksonville scale. The United Mine Workers draws revenue now only from the anthracite miners and checkoff from Illinois and Indiana and scattering small districts in the middle and far West. Recognition by the union that much valuable territory has been lost is betrayed by the anxiety of the union leaders to force a meeting with these operators.

Large Stocks and Low Prices May Continue

With stocks on Jan. 1 probably in excess of 50,000,000 tons, prices averaging below $2 and demand for less than 10,000,000 tons per week, there is no prospect for early return of prosperity in the soft coal fields. There is no indication that a boom will appear sufficient to tempt operators to abandon their program of reorganization on a non-union basis in favor of temporary profits. Thus another year may surely be expected to record still further inroads on the union's hold and even larger percentages of non-union production of bituminous coal.

Production of around 520,000,000 tons of soft coal in 1927 established no new record. Shipment of nearly 33,000,000 tons of Lake cargo coal is a new high point, however. Exports overseas were below normal. With no threat of shortage or higher prices hanging over the industrial users' heads there can be no gain in production until stocks are liquidated and demand, particularly that of the iron and steel industry, picks up.

Marked Progress in Non-Ferrous Metallurgy Last Year



Expansion in Chromium—New Uses for Nickel—Aluminum in Lighter Transportation—Electrolytic Zinc on the Horizon—More Copper Used

BY W. M. CORSE*

IT is becoming increasingly apparent that the high average of prosperity in the field of non-ferrous metallurgy is being maintained, to a great extent, by the pursuit of research and sales development methods.

Copper—*Advantages Broadcast*

THE copper industry, through the Copper and Brass Research Association, reports that the advantages of using copper, brass, bronze and other copper alloys are being more widely recognized every year. Where formerly one person was aware of the economy and advantage of using copper or its alloys, now the general public is better acquainted with their merits.

In this survey of the copper field during the past year, improvements of materials already existing and an increase of their use has been closely followed by some new uses. Brass pipe has shown a decided increase in consumption. Charts show that it has maintained for the past three years an average yearly increase of 76 per cent, and a total increase since 1923 of approximately 228 per cent. Municipalities and water companies are turning to copper, thin-walled tubing and brass pipe for service installations. The radio industry continues to consume large quantities of copper and its alloys, as does the automobile industry. Farmers are turning to copper for lightning rods, and this is a growing outlet. The building industry depends more and more on copper products where economic, lasting and beautiful installation is desired. From roof to cellar it finds its place. Copper and brass radiators are coming into favor, and a relatively new and growing market is the household refrigerator.

Lead—*No Spectacular Progress*

THERE have been no spectacular developments in lead during 1927. Continued research has resulted in the production of a soft paste white lead of high quality which will reduce costs by lowering the time and labor required for mixing. This is a considerable item when one takes into account the wide and growing use of paints of all kinds.

One use for lead which is attracting considerable attention is its appearance in the composition of lead mattresses that act as shock absorbers to neutralize vibration, especially in sky scraper construction on rock foundations. These were used experimentally by architectural engineers about 1917, and the results have been so satisfactory that lead mattresses were used in the new Graybar Building in New York, and have been specified for the new union station in Buffalo.

In other branches of the lead industry progress has continued along well established lines.

Zinc—*New Processes and Alloys*

THE main development in the high zinc alloy field last year was that of a zinc base magnesium-bearing alloy designed principally for die casting.

The use of the metal in the slab and wrought form has continued in the industries as follows: 47 per cent for galvanizing; 29 per cent for brass and other copper and nickel alloys; 14 per cent for rolling, and 10 per cent for miscellaneous purposes.

In the electrolytic field, the Bunker Hill & Sullivan Mining Co. at Kellogg, Idaho, is erecting a new electrolytic plant at which the Tainton process will be employed. This differs from existing plants in the method of solution and purification, and the use of much higher current density, which gives heavier deposits and materially decreases the size of the plant. The Anaconda Copper Co. is building an additional plant at Anaconda, Mont. Both of these are expected to be in operation in the early part of this year.

The retort method carries on in the old manner. Several companies have added sintering equipment which has materially improved their recoveries.

In England, the Coley process, a pyro-metallurgical reduction in a rotating furnace; and the Ashcroft process, a pyro-electrolytic reduction in which molten zinc chloride is electrolyzed after being produced from zinc chloride and chlorine at elevated temperatures, are being operated in semi-commercial plants.

---

*Metallurgical engineer, 810 Eighteenth Street, Washington.

In Germany, the Waelz process, a fire concentration of low grade zinc material in a rotating furnace, has been installed in several commercial plants, while one plant is being erected in the United States.

Nickel—*New Outlets Developed*

A REVIEW of the nickel situation would seem to indicate that nickel has not only maintained its general high average in existing usages, but is finding new outlets in unsuspected directions.

It was believed that the development of chromium plating, which took a leap forward with the clearing up of the patent situation, would react unfavorably on nickel plating, whereas the contrary was the case. It developed in practice that chromium, plated over nickel plate, resulted in a more lasting product.

Monel metal, the well-known high-nickel alloy, reached out into an entirely new field of usefulness. This alloy, which is remarkable for its color, closely resembling pure nickel, and for its resistance to corrosion and abrasion, is being increasingly used in existing fields including dairy equipment, hotel kitchens and cafeterias—where it is used for table tops, cooking utensils, boilers, etc.—as well as in the new use first mentioned in this review last year, as traffic markers to replace the lines of white paint which have become necessary for marking traffic lanes in congested city streets. The increasing cost of maintaining painted traffic lines has resulted in a search by officials for something to lower costs and yet remain as efficient and as noticeable as the lines painted on the pavements.

Development of solid nickel-silver plumbing fixtures and equipment has made considerable progress during the past year. The advantages of a solid metal for fixtures, where future replacement costs must be kept at a minimum—such as hospitals, government buildings, etc.—is becoming recognized as not only desirable but necessary. Solid nickel-silver, with a 20 per cent nickel content, retains the color of pure nickel and no amount of polishing will take off the coating and show a different colored base, because solid nickel-silver is exactly what its name implies—solid throughout. It appears in the list of standard specifications for plumbing fixtures of the United States Government; it has had considerable use in naval hospitals and other public buildings throughout the country during the last year, and has been specified in connection with the monumental building program of the Government in Washington.

There is no question that the large amount of technical information furnished by the manufacturers of nickel has been an effective contributing cause of its growing use in established fields, and its introduction into new ones.

Aluminum and Magnesium—*Uses Expanding*

THE most interesting development in the aluminum industry for 1927 was the introduction of Alclad, a new aluminum sheet. Its application is indicated where strength and corrosion resistance are of major consideration, and it promises to be particularly useful in the manufacture of airplanes. Alclad consists of a heat-treated aluminum alloy base, with a smooth, dense, non-porous surface of very pure aluminum of uniform thickness alloyed and integral with the core, and it combines the corrosion resistant properties of pure aluminum on the surface with high strength and stiffness. Exhaustive corrosion tests show that these composite sheets are many times more resistant to moist air and salt spray than the unprotected strong aluminum alloys.

The use of aluminum sheet continues to gain in favor in the transportation field where the trend is distinctly toward weight saving. The strongest trend in this direction was experienced during the past year, and November marked the completion of 32,000 miles regular service of an aluminum car on the lines of the Cleveland Street Railway. This car weighs 30 per cent less than the same car in steel and over a 10-month period has shown a saving of 22 per cent of the power required to operate a steel car of similar capacity. A careful inspection was recently made and every aluminum part was found to be in perfect condition.

The Chicago & Joliet Railway, the Illinois Central, the Chicago & Northwestern Railway Co., the Alton and the Southern Railroads are a few that are installing cars constructed of aluminum in so far as possible.

Trend Is Lighter Weight in Transportation

This modern trend toward lighter weight in transportation of all sorts gives many advantages. A lighter train, or street car, or bus has more rapid acceleration and deceleration. This means less power for operation. With quicker starts and stops shorter running schedules can be established and maintained. Light weight means less wear and tear on the vehicle itself as well as on the track or highway. An especial advantage in the case of street railroad equipment lies in the markedly quieter operation of light weight cars.

During 1927 it has been demonstrated that structural shapes can be rolled from aluminum strong alloys in lengths of 80 ft. or more. Two special types of sheet for radio condensers were produced during 1927—these are of particularly high grade, rolled to the closest tolerance both as to gage and flatness, to permit fabrication of the most efficient variable condensers. A new top-down aluminum shingle was put on the market during the past year. The chief advantage of this shingle lies in its construction which permits it to be applied commencing at the ridge of the roof, successive rows being added moving down toward the eaves until the whole roof is covered. These can be applied at a labor cost of 50 to 70 per cent of that for other types of roofing materials. Aluminum nails have also been introduced and it is now possible to supply a complete aluminum roof and gutter job.

The existing uses of aluminum and its alloys showed increase in practically all instances. Aluminum foil, which is rapidly supplanting pure tin and composition foils, has increased in use 150 per cent during the past two years, and aluminum bronze powder as a paint pigment has taken its place with the older and more commonly known pigments. Sales of aluminum collapsible tubes have doubled over those of 1926, and 700,000 lb. of rod was used in the manufacture of screw machine products last year.

Magnesium—Expansion in Established Uses

There has been a gradual improvement in this field which has taken the form of increased uses for already established applications rather than the discovery of new uses. The sales of ingot have gained ground because of increased knowledge of the strong deoxidizing power of magnesium, and magnesium is being used in increasing quantities in high strength aluminum alloys.

The production of magnesium alloy castings has greatly increased. Parts for aircraft engines such as gear case cover, housing, etc., continue to call for increased poundage. The use of magnesium castings for aircraft engine starters has just about doubled during 1927. Aside from aviation, there is an increasing call for magnesium castings in such applications as textile machinery, the moving picture industry, etc.

The sales of magnesium wire and ribbon remain about on the same level, with the radio tube business taking the largest amount of the production. A 99.98 per cent purity is still demanded by this industry. Magnesium powder is being produced in larger quantities. In 1927 the increase will probably be approximately 25 per cent over that of 1926.

Chromium—*Two General Trends of Development*

DEVELOPMENTS in the use of chromium have gone on in two general directions: One, a wider recognition of the properties it confers on low-carbon steels for some interesting engineering applications, and the other, an expansion of the applications for the high-chromium alloys, particularly in the corrosion resistant fields.

The former trend is obviously one in line with an even more general movement, that is, the recognition of a new principle in engineering steels—the raising of alloying content and the drop in the carbon content. By means of such an adjustment, the hardness (tensile strength) formerly obtained by carbon, is now developed by the presence of the alloying elements, but with this essential difference, the increase of hardness is *not* at the expense of toughness, since the latter essential property is actually enhanced by the proper balance of alloy and carbon content.

Most convincing evidence of this revolution is to be found in many marked examples. Witness the acceptance of the so-called silicon steels in ever increasing proportions in important structures, notably some new central station construction and two of the largest suspension bridges. Chromium is able to take its place in this advance by virtue of the fact that its quality of strengthening and toughening (with proper carbon content) is extended throughout the cross section of the member.

With respect to the high-chromium alloys, the use of the nickel-chromium compositions of austenitic range seems to be coming into more general favor. This is a natural sequence because of the combination of cold working properties with more inclusive resistance to corroding media. These remarks on the nickel-chromium compositions apply particularly to the extension of chrome-iron alloys in the chemical industries; in the straight rust resisting uses the rustless irons still hold sway, with the tendency to keep the chromium content above 14 per cent.

Chromium Plating Expands

The use of chromium plating has advanced rapidly during the past year. Its use may be expected to increase at a still faster rate as a result of the consolidation of most of the important patents in the United Chromium Corporation which will enable the various licensing companies to institute a more active development program.

The element silicon is rapidly being used in many new ways. Its application in steels for alloying purposes was mentioned above; in the non-ferrous alloys its effects have been capitalized and the past year has witnessed research in several fields of non-ferrous alloys. Much remains to be done in investigation of what will probably result in improvement of brass and copper alloys by means of higher silicon content.

Cadmium plating, because of its superior rust resisting properties, is being applied more and more generally in industry. In view of the growing appreciation of the necessity for rust prevention, a rapid increase can be predicted for the use of this type of plating.

In the short space permitted it has not been possible to give a complete picture of the developments in any one industry. It has been possible only to point out the outstanding developments.

AWARDS HARRIMAN MEDALS

Schwab Praises Safety Work of Railroads in Annual Presentation

That the conduct of industry involves not merely the efficient direction of machines, but primarily the guidance, the protection and the promotion of human beings, was brought out by Charles M. Schwab in an address before the American Museum of Safety in New York on Dec. 28. The occasion was the presentation of the E. H. Harriman Memorial Medals and special certificates to railroads for safety and accident prevention work in the year ended Dec. 31, 1926.

"Amazing progress has been made," said Mr. Schwab, "in bringing about efficient and economical production. The modern scientist has enabled us to manipulate machines through his penetration for us into the secrets of chemistry and physics. But the transcendent machine is the human being, the man with feelings, with sensibilities, with hopes and fears and responsibilities. It is the human being of whom we are thinking more than ever today, and the business man is a poor manager whose primary thought is not to bring about a fuller life and a finer existence for the human beings with whom he comes in contact."

Calling attention to the promotion of healthy rivalry among railroads in attaining safety which has been brought about by the American Museum of Safety, Mr. Schwab explained that the Harriman Memorial Medals are presented annually to the Class I steam railroads which, in their respective groups, have done the most during the year to secure progress in safety and accident prevention.

The gold medal was awarded to the Norfolk & Western Railway, which in 1926 showed a reduction of 28 per cent in the number of persons killed, as compared with 1925, and of 15 per cent in the number injured. The silver and bronze medals were awarded to the Duluth, Missabe & Northern Railway and the Quincy, Omaha & Kansas City Railroad respectively, both of which had records of no passengers or employees killed during the year.

California Firm Gets Airplane Order

WASHINGTON, Jan. 3.—The Navy Department last week awarded a contract to the Douglas Co., Santa Monica, Cal., for 25 PN-10 type airplanes, with spare parts and drawings, at a total cost of $1,553,505. The planes will be equipped with two air-cooled engines of 500 hp. each, of either the Pratt & Whitney or the Wright types. The department also awarded a contract to the Hall Aluminum Aircraft Corporation, New York, for one Type-V plane, with design information, miscellaneous data and drawings, at a total cost of $131,612. This plane will be powered by twin air-cooled engines of 500 hp. each.

Copper, Tin, Zinc Markets Reviewed

Authorities in the Trade Survey Course of Production, Stocks and Prices Last Year

REVIEWS of three important non-ferrous markets for 1927 *have been written by men whose standing in the trade lends authority and interest to what they have to say. While copper is not as closely associated with the making of steel products as are tin and zinc, its importance in industry is large. The relation of all three to the economic life of the country is a commanding one and the following brief summaries are presented as of vital interest.*

Copper Market Has a Bright Future

BY H. M. BRUSH*

SO far as the copper market is concerned, the year 1927 was divided into two nearly equal parts.

The first half of the year was a period of pessimism and declining prices; the second half of the year was a period of optimism and rising prices.

The refinery price for copper on Jan. 1, 1926 was 13.025c. per lb. There was a gradual, but quite persistent fall to a low of 12.175c. per lb. on June 20. This radical fall was due to a variety of causes:

1—An unwarranted increase in the production which started in the autumn of 1926.
2—Fear of a business reaction in the United States.
3—Skepticism on the part of Europe which resulted in their reducing their stocks of visible copper, thereby supplanting American primary production to a corresponding extent.
4—Hand-to-mouth buying by both European and American buyers carried to greater lengths than ever before, thereby resulting in a decrease in the invisible supplies of copper which it is impossible to estimate, but which we know to have been in substantial amount.

Shortly after July 1 figures assembled by the American Bureau of Metal Statistics indicated that production was again being reduced because of the low price of copper, and there were many evidences that consumers had run their stocks down to a point where they would shortly be forced to buy irrespective of their opinion of the market.

The average refinery price in June was the lowest of the year, namely, 12.37c. per lb. The price has increased since then first gradually and in the last two months rapidly to its present level of 13.75c. per lb.

Production for the year 1927 would seem to have increased about 3 per cent over production for 1926, which was the record year for the copper industry. This increase is less than a normal increase and has resulted in a decrease in the world's visible stocks of probably 50,000 tons. Stocks of copper are now rather below a proper level than above it. There would seem to be no danger in this situation, however, because of the possibility of increasing production should the consumptive requirements of the world demand a greater output of copper.

The formation of the Copper Institute in 1927 will, it is hoped, be as long a step forward for the copper industry as was the formation of Copper Exporters, Inc., in 1926. The Copper and Brass Research Association is continuing its splendid work in advertising copper to the ultimate consumers. The American Bureau of Metal Statistics is continuing its thorough statistical survey of world production and consumption. Copper Exporters, Inc., through its selling organization in Europe and its office staff in New York, is fully and currently posted as to conditions in the copper market outside of the United States. The Copper Institute is preparing to compile detailed and current figures as to production, cost of production, consumption and sales data in America.

With all this information at last available it will be a sorry commentary on the ability and vision of copper producers of the world if they insist upon producing their product, which is a wasting asset, in quantities so much greater than the consumers of the world are using that prices will be forced down to a level where any considerable portion of the production must be sold at less than its cost.

---

*Vice-president in charge of sales, American Smelting & Refining Co., New York.

Tin Prices Not Likely to Decline Much

BY JOHN P. WILSON*

FROM a market standpoint, tin did not do so badly during the first half of 1927, but began to react in July and August, and by early November had hit the lowest level since June, 1925. Among other reasons for the decline in price, the most important were a falling off of about 5000 tons in American deliveries and increased shipments from the Straits of somewhere between 4500 and 5000 tons.

These figures on their face are obviously bearish, but no evidence has been found of hidden supplies held off the market, and as the visible supply at the end of this year was likely to show little if any change as compared to Dec. 31, 1926, it seems probable that consumption in other countries must have absorbed not only increased production in the Straits but from other sources of supply. The *Mining Journal* of London recently computed that world supplies in 1927 were increasing at the rate of 1000 tons per month. If this is true, it would seem wise to look back a few years and try to view the situation as a whole, and get a better perspective from which to judge the future.

A fact often overlooked, but familiar to students of tin figures, is that the official statistics issued each month by the metal exchanges in London and New York do not truly picture current production and consumption. For about three years past the tin content of ores produced in Bolivia, Cornwall, Nigeria and South Africa, has annually exceeded 40,000 tons, but less than half of it comes into statistics under the caption of "Standard Supplies." Practically all of it is smelted in England and Germany, but the smelters do not make public the tonnage produced or quantities shipped by them to consumers in Great Britain and the Continent of Europe, so they also fail to appear in the figures of monthly deliveries. This failure to credit other countries with their full consumption makes America appear a veritable colossus, consuming five-eighths to two-thirds of the world's tin, and dwarfing other countries by comparison, whereas in 1924 and 1925 we actually consumed slightly less than half.

---

*Metal broker, 111 Broadway, New York.

In the table given below account has been taken of all tin entering world supplies either as refined metal or in the form of concentrates, of the visible supplies at the end of each year, and consumption in other countries is shown by difference. It is not claimed that the resulting figures are beyond criticism, but the percentage of error would seem to be small, inasmuch as visible supplies have steadily decreased during the period under review, and no evidence has been found of hoarded supplies:

	World Deliveries (Consumption)			World Supplies Coming Into Sight From All Sources
	U. S. A.	Other Countries	Total	
1922......	66,640	52,427	119,067	118,847
1923......	72,815	57,801	130,616	126,627
1924......	64,125	70,382	134,507	138,584
1925......	76,455	76,757	153,212	146,148
1926......	78,050	60,473	138,523	136,825
	358,085	317,840	675,925	667,031
Adding visible supply as of Dec. 31, 1921				25,220
				692,251
Subtracting total world deliveries......				675,925
Gives visible supply as of Dec. 31, 1926..				16,326

Thus the figures show a shrinkage in the visible supply during the five year period of 8894 tons.

As regards the situation in this country, let us bear in mind that 1927 follows the most wonderful year in our business history. In 1926 we broke all previous records of tin consumption, largely because British industry was badly crippled, and export business which otherwise would have gone to British mills came to ours. Surely we cannot hope to go on year after year breaking records. However, 1927 has not been what could be called a bad year, as our deliveries will total about 73,000 tons, which is better than any other 12 months except 1925 and 1926, and unless most of our business forecasters are badly fooled, 1928 may bring us back to somewhere near the 1926 figures.

Looking at the figures for other countries, it will be seen that in 1924 they consumed about 6000 tons more than we did, and topped us slightly again in 1925 but, for the reason stated above, their 1926 figures show a severe decline. It should be noted though that not only Great Britain, but Germany and the other great industrial countries are coming back strong. Their population vastly exceeds ours and their needs are correspondingly greater; and, what is more to the point, their credit is improving and they are better able to finance their growing business.

In conclusion, the whole world is in a period of tremendous expansion. The motor car, airplane and radio are bringing all peoples into closer communication and increasing the needs of nations for commodities and products they formerly got along very well without. Tin is produced in but a few localities, but it is used everywhere. It seems then more logical to expect for some years to come that production will continue to lag behind consumption and that no serious decline in the price level may be expected until it catches up.

Zinc Values Touched Lowest Levels in Five Years

BY A MEMBER OF THE TRADE

IN zinc, the year 1927 was characterized by a downward trend of prices, which persisted with but slight interruption and which has resulted in lower market values than are warranted, in view of production costs to the industry as a whole.

At the beginning of the last quarter of 1926, when the metal was quotable at about $7.40 per hundred pounds East St. Louis, and in the face of record consumption, the trend of quotations started on a downward course which continued with but slight reactions until November, 1927. Then $5.60 East St. Louis was reached, the lowest point touched since 1922, and a figure which approximates the average for ten years prior to 1914.

Primary spelter production for eleven months amounted to 561,200 tons, and estimating December at 50,000 tons, a total of about 610,000 tons might be expected for the year. In 1926 the total was 638,533. Domestic shipments, while not quite equal to the previous year, have been maintained in good volume, averaging about 46,000 tons monthly. Exports for 1927 will likely approximate the 1926 figure of 42,000 tons. This would indicate a probable total approaching 600,000 tons for the year just ended as compared with 625,941 for 1926.

Stocks of metal gradually increased from the low point, 14,481 tons at the end of November, 1926, to the end of June, 1927, when they reached a peak of 43,858 tons. The tide then turned and a decline began, leaving the stock on Nov. 30, 1927, at 39,320 tons.

Decreased consumption and increased stocks, no doubt, were the immediate cause of the decline in price, but the excess accumulation which, at its height never reached a month's supply, does not seem sufficient itself to account entirely for the long downward swing. The answer is probably to be found in the development of selective flotation for the treatment of complex ores and the growth of the electrolytic method for the recovery of the metal. This modification of the flotation process has made available a zinc value which was previously not only a loss but a penalty. It has enhanced the profits of many mines operating in the northern Rocky Mountain country and made profitable others which had been abandoned, resulting in a greatly increased production of zinc concentrates at a relatively low cost. The rapid increase in the electrolytic output coincides with this increasing ore supply and it is estimated that during 1928 upward of 250,000 tons of electrolytic capacity will be in operation in the Rocky Mountain region of this country and Canada.

The smelters of Continental Europe, who a few years ago were combing the world for ore, are now receiving an ample supply of zinc concentrates from Mexico and elsewhere, while production in Silesia has been stimulated by the introduction of American capital. As a consequence diminishing exports of spelter from this country probably may be expected.

To summarize: Selective flotation has made available a considerable quantity of cheap zinc concentrates particularly adapted for treatment by the electrolytic method. Properties producing such complex ores are being and will be developed, so that the relative importance of the Tri-State field—Missouri-Kansas-Oklahoma—as a basis of ore supply is likely to be lessened to some extent. Correspondingly, the slab zinc output produced by the electrolytic method is likely to be increased and the proportion produced by the retort method reduced. The principal factor determining the amount of slab zinc produced by the retort and electrolytic methods respectively will be the relative cost of mining and delivering the zinc in the concentrates produced at the smelter or electrolytic plant, and doubtless competition will be sharp in ascertaining on this basis the relative share for each method.

Further Gain in Water Shipments

River and Lake Movement of Iron and Steel Mounts—Pittsburgh District Traffic Largest on Record

WATER shipments of iron and steel showed a further gain in 1927. River traffic expanded, in the Pittsburgh district being the largest ever recorded, and there was a substantial increase in the movement of pig iron and steel, as well as scrap, on the Great Lakes. Progress was made in the canalization of the Ohio and Illinois rivers, and barge service was inaugurated on the upper Mississippi River.

While complete statistics for the river movement out of the Pittsburgh district are not available, those at hand clearly indicate a record. The figures reported monthly by the Pittsburgh district United States Engineers' office disclose that, for the 11 months ended Nov. 30, there had passed down the Allegheny River 12,967 net tons of iron and steel products; that in the same period shipments over the Monongahela River totaled 623,165 tons, while the iron and steel carried on the Ohio River from Pittsburgh as far as Wellsburg, W. Va., the limit of the Pittsburgh office survey, aggregated 628,790 tons. The grand total was 1,264,922 tons, but there was some duplication of figures in view of the fact that the Ohio River begins at Pittsburgh through the confluence at that point of the Allegheny and Monongahela rivers. Ignoring that total and taking only the tonnage carried on the Ohio River as indicative of what moved to distant down-river points, or well outside the zone that Pittsburgh producers could reach profitably by rail deliveries, the total of 628,790 tons for the 11 months exceeds the total movement on the Ohio River as reported from the several district engineers' offices at Pittsburgh, Huntington, W. Va., Cincinnati and Louisville, Ky., for all of 1926, which was 487,261 tons. It was also larger than the 1925 total of 534,817 tons.

In connection with this showing, it may be pointed out that the canalization of the Ohio River has not yet been completed between Evansville, Ind., and Cairo, Ill., and ordinarily that long stretch has a sufficient stage of water to carry heavy tows of steel only during about six months of the year. Nevertheless, the Jones & Laughlin Steel Corporation, for the first time since it started river service in the fall of 1921, maintained shipments throughout the summer of 1927, although in passing through the shallow water between Evansville and Cairo it was necessary to open completed locks behind the tows to provide enough water to carry them through to the deeper water beyond Cairo. The Federal Government, however, is making steady progress in its work on this section of the river, and present indications are that the lock and dam system and the establishment of a permanent 9-ft. stage from Pittsburgh to Cairo will be completed by 1929, as planned.

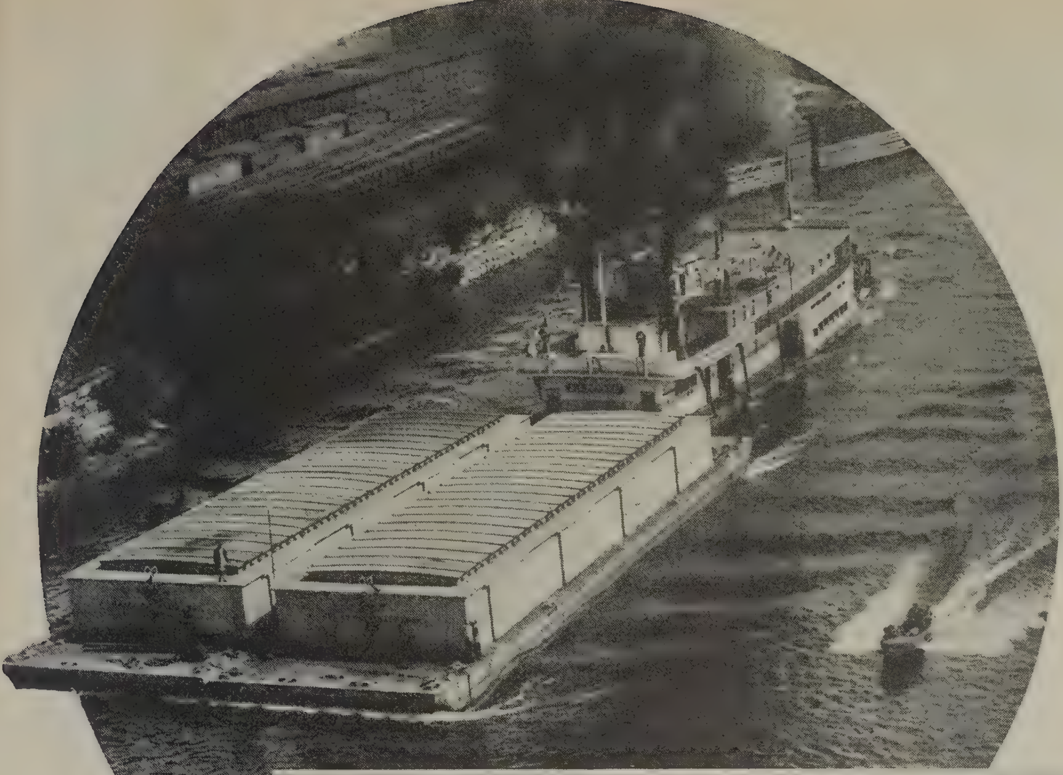
Iron and steel producers at lower Ohio River points also made more use of water transportation in 1927. One Ironton, Ohio, plant operated a towboat and a fleet of barges throughout the year to deliver pig iron and wire nails to Ohio River points. In quoting nails at Cincinnati and other cities along the river, the company made Ironton the base for prices, to which it added the regularly established barge rate charged by river packet companies. Another Ironton producer started shipping pig iron by barge in July. This company installed loading equipment on its property along the river but, instead of investing in river craft, contracted with a commercial line to handle its product.

In June a river-rail terminal at Cincinnati was formally put into operation. Here cargoes of iron and steel are transferred to railroad cars for delivery to consumers in the Cincinnati district. The terminal is used extensively by the Jones & Laughlin Steel Corporation in connection with the shipment of its products to its Cincinnati warehouse.

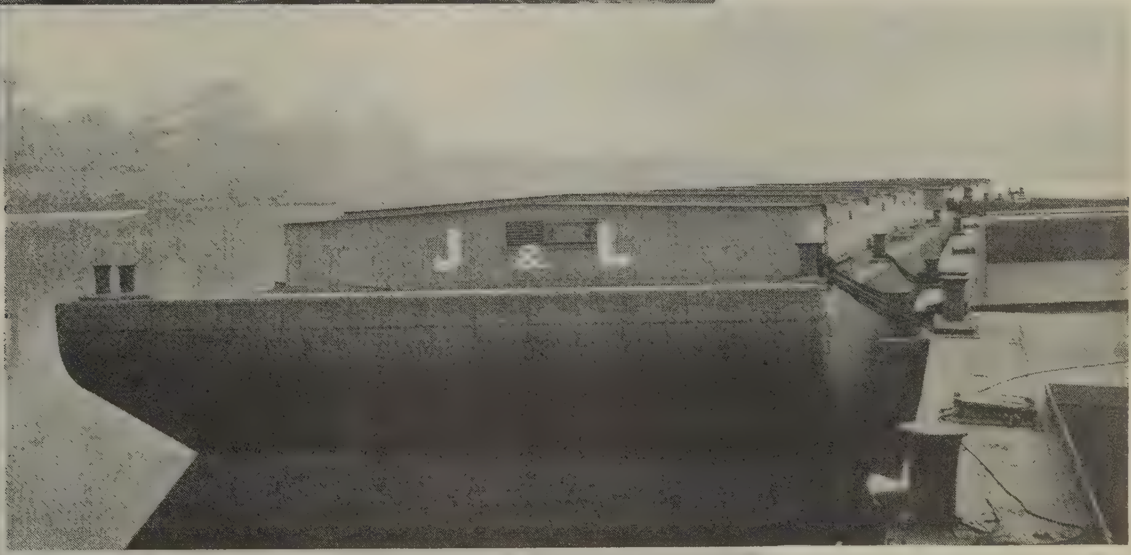
The Ohio River was also used during the year by the Granite City, Ill., producer of pig iron for shipments to points upstream as far as Louisville.

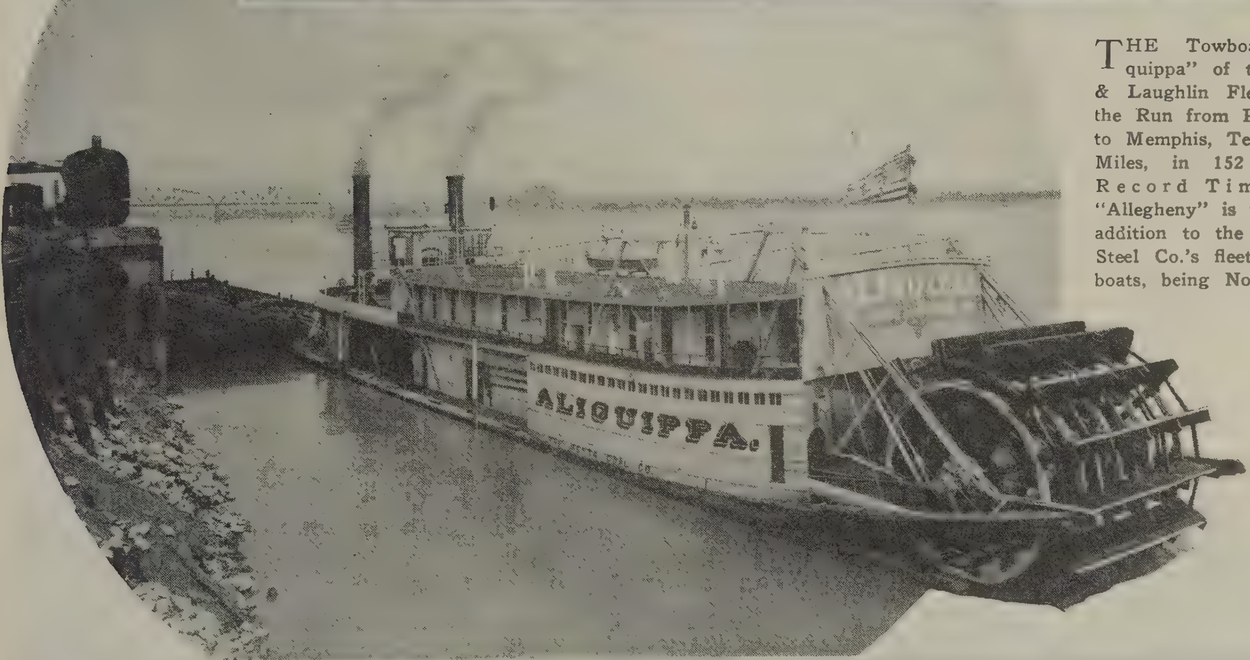
Of outstanding interest on the Mississippi River in 1927 was the inauguration of Federal barge service on the upper reaches of the stream in mid-August. In the three months during which the line was in operation a Granite City mill shipped a small tonnage of sheets to Minneapolis and Chicago district producers moved about 600 tons of various products, including fence, wire, nails, sheets, steel pipe, rail steel bars and soft steel bars. Producers in Indiana, Chicago and Peoria, Ill., shipped by rail to Dubuque, Iowa, and thence by barge to St. Paul and Minneapolis. The combined rail and water rate from Chicago to Minneapolis via Dubuque is 23½c. per 100 lb., as compared with an all-rail rate of 27½c.

At Minneapolis a river bank warehouse was con-

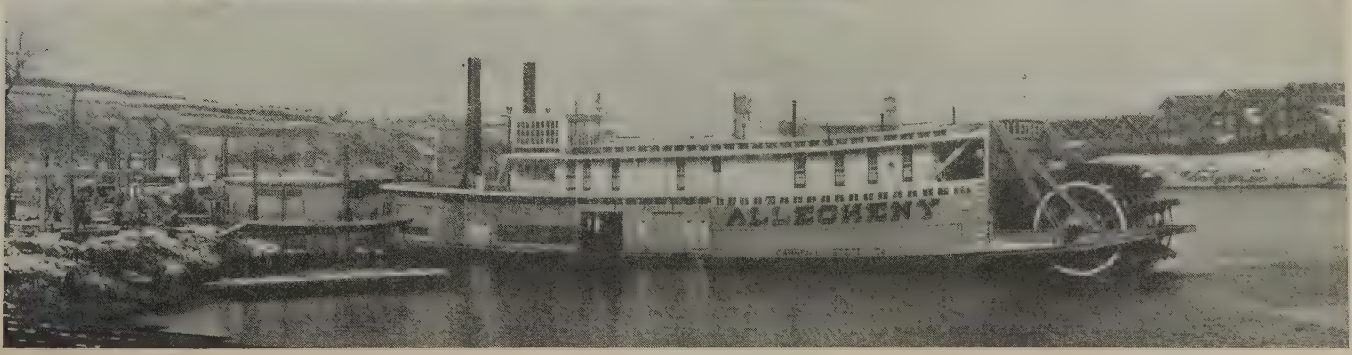


THE "Thorpe" Towing Barges from St. Paul to Minneapolis on the Upper Mississippi River (at Left). A box-type of barge, which is supplanting the coal barge as a carrier for steel, especially products damaged by exposure (below)





THE Towboat "Aliquippa" of the Jones & Laughlin Fleet Made the Run from Pittsburgh to Memphis, Tenn., 1200 Miles, in 152 Hr., a Record Time. The "Allegheny" is the latest addition to the Carnegie Steel Co.'s fleet of towboats, being No. 14.



structed, largely under the auspices of the municipality. As an inducement to iron and steel producers to use the barge line, free storage in the warehouse is offered. In addition, arrangements have been made whereby the barge company, during the winter months, will bill and load from stocks in the warehouse without charge.

The maximum draft of boats operating on the upper Mississippi River is between 4½ and 5 ft. Flood control reservoirs along this stretch of the river assure a 7-ft. channel throughout the season of navigation, which extends from April to mid-November. In this respect the upper river is more dependable than the lower stretches.

On the entire river the barge movement of all commodities in 1927 fell some 15 to 20 per cent below the total for 1926. The main causes were:

1. Spring floods adversely affected the credit of the communities along the lower stretches of the river, curtailing the volume of business transacted.
2. In September low water hampered the movement of river craft.
3. The general volume of business in 1927 was below that of 1926, which was a peak year in barge traffic on the river.

Of particular interest to the Chicago district is the work on the connecting link which is to join the Mississippi River system with the Great Lakes. In terms of money expended the State of Illinois has completed about 60 per cent of its part of the development of the Illinois River. In this stretch, locks 110 ft. wide by 600 ft. long are being built so that tows may pass through without being broken for lock passage. Two locks have been completed with the exception of mitre gates and operating machinery, and agreements have been reached with a public utility company whereby five miles of retaining wall through Joliet, Ill., and a lock and dam below that city can now be finished. A lock at Dresden Island, Ill., and a canal to be built around rapids at Marseilles, Ill., are the only projects that remain to be placed under contract by the State. South of Starved Rock, Ill., the river is ordinarily open to craft of 5 and 6-ft. draft, but the Federal Government nevertheless plans to improve that stretch with locks and dams.

Heavier Movement on Great Lakes

Nineteen twenty-seven showed a gain in shipments of steel, pig iron and scrap on the Great Lakes. One company alone moved 125,000 tons of scrap from Detroit and other Great Lakes points in the West to its plant at Buffalo, and shipped about an equal tonnage of steel in the opposite direction. A Cleveland steel manufacturer began to make shipments of steel by water to Detroit in the latter part of the navigation season and moved a total of about 30,000 tons, mostly sheets and hot and cold-rolled strip. This was handled on a boat leased by the company, and loading was done directly at the steel plant. Scrap carried by the vessel on return trips from Detroit totaled about 20,000 tons.

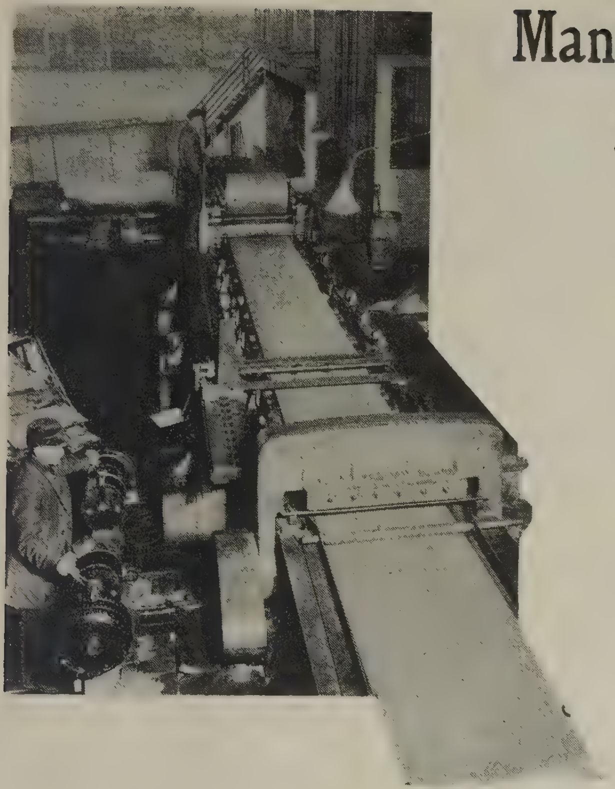
The United States Steel Corporation kept in commission four 250-ft. boats with a carrying capacity of 2000 tons each during the entire season, carrying finished steel for the Canadian trade. This Lake fleet is operated by a subsidiary, the United States Steel Products Co. It was the first year that four boats were in service throughout the navigation season, two of them having been completed in 1926. The company's Lake shipments in 1927, however, declined to 115,000 tons from a total of 130,000 tons in the previous year, reflecting a slowing up of demand. A Chicago company continued to use the Lakes for shipments of alloy steel to Detroit in the past year, and also received a 1200-ton cargo of alloy steel scrap from Great Britain.

Pig iron shipments on the Great Lakes were particularly heavy in 1927. A Buffalo producer shipped 42,000 tons, including 12,000 tons of silvery iron, to Detroit. Another Buffalo maker moved a cargo of 2000 tons to Chicago, and a third Buffalo interest made a shipment by water to Toledo, Ohio, whence it went by rail to its plant at Bremen, Ind. There were large Lake shipments from Cleveland to Chicago. One Cleveland producer shipped between 20,000 to 25,000 tons, and another 10,000 tons.

Efforts to establish a regular water transportation service between Cleveland and Detroit to carry steel from Valley and Cleveland mills have not met with success, and two dock companies in Cleveland that are equipped for handling steel from cars to Lake boats handled no tonnage whatever. One of the obstacles to water shipments to Detroit, perhaps the principal one, is the desire of large consumers in the automotive field to have a steady flow of steel from the mills to their plants. If an automobile manufacturer is using two or three cars of steel a day, he wants that number of carloads to reach his plant daily, and mills, aided by excellent transportation service, are able to make deliveries as desired.

Those interested in promoting water shipments of steel from Ohio mills to Detroit contend that as good service can be furnished by water as by rail. One plan suggested is to have three boats of about 1500 tons capacity handling steel between the two ports. This would permit shipments of a boatload every day and would insure a steady flow of steel from the receiving docks in Detroit to consuming plants. The 1500-ton cargo, according to this plan, could be made up of carlot shipments from a number of Ohio mills, which could be consigned to a number of consumers. It is stated that steel can be delivered from Valley mills by rail and water to consumers' yards in Detroit at $3.68 per ton, as compared with an all-rail rate of $5.30, or a saving of $1.62 per ton.

A Car Ferry Put into Commission During the Year by the Jones & Laughlin Steel Corporation, Connecting Its Pittsburgh and Woodlawn, Pa., Works, Permits Partial Loading at Each Plant, Eliminating Interplant Movements by Rail



Many Factors Participated in Development of Continuous Sheet

Administration of Patents and the Economic Relation of Strip Mills to New and Old Style Sheet Mills Are Future Problems of Importance

WHILE the art of rolling steel has progressed in many details during 1927, and more powerful, more productive, and more economical units have been installed at various places, the progress in the sheet industry has deservedly attracted the most attention. The sheet industry, the last of the divisions of the steel business to respond to the urgent call for improvements, has been going through an evolution which has culminated in a radical departure from the established and traditional methods, and which probably will have the same effect on the conventional sheet mills as the development of the modern continuous bar mill had on the old-fashioned hand mills.

Great Tonnages Needed

Just as the present continuous merchant mills are only economical for large tonnages, so the new method of making sheets will by the law of economics be applicable only to large tonnage plants. The old idea must be discarded that large tonnages mean inferior quality, for it has been one of the surprising discoveries of this new method that both the surface condition and the grain structure are improved.

It is strange that such a development should have been so long in coming, but possibly it had to wait for a growth in the sheet business to the point where much larger tonnages were required. Or it may be entirely possible that it was the increased knowledge and inventive genius of the new generation coming after the expensive failure of some twenty-two years ago, which coupled to all the other factors, crystallized into the achievement.

Precision Without Precedent

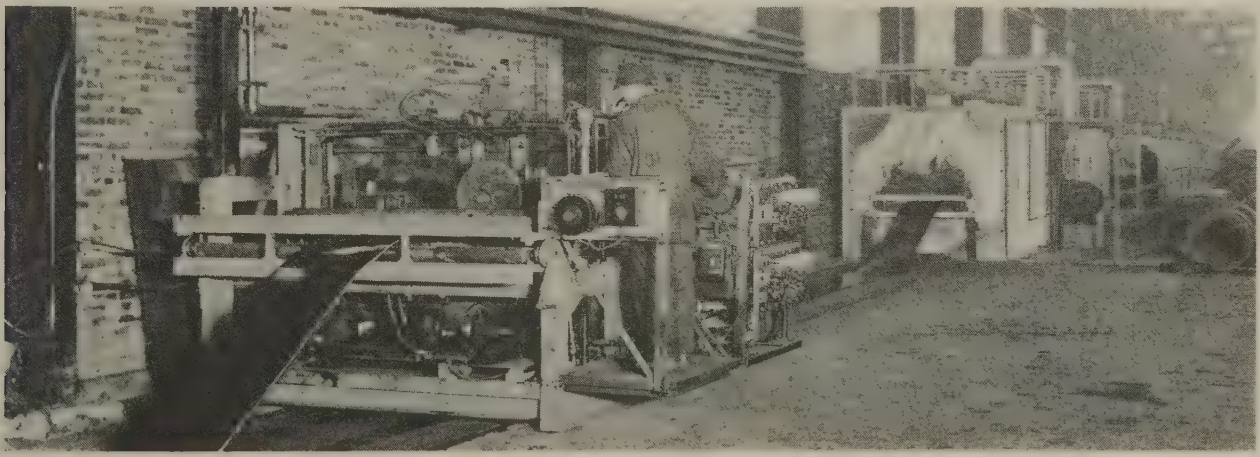
The process also has been scientifically analyzed, in the same way as with the blast furnace some years ago which resulted in better control, larger output and lower cost. Scientific appliances were developed to record rolling pressures, and instruments devised to measure roll diameters to the thousandth of an inch. These merely furnished the data which had to be interpreted and then applied to the design of the modern mills.

Rolling of long pieces of wide thin material might be done by extending the length of sheets, or by increasing the width of strips. It is interesting, in retrospect at least, to note that while there are these two avenues of approach to a solution of this problem, what seemed the most difficult was solved first. As recorded in Stephen Badlam's paper read before the American Iron and Steel Institute on Oct. 28, 1927, the sheet development has made the greatest step forward in a relatively short time, while the strip process has been gradually but steadily advancing. However, the strip process has not yet been able to reach the ratio of width to thinness that is now regularly employed for the continuous manufacture of sheets.

It will be very interesting to watch the further progress with these two methods of solving one of the outstanding problems of the steel industry, and it is entirely possible that each method will find its own economic limitations.

Some of the elements contributing to the successful operation of this improvement in rolling mill practice

(*Concluded on page* 109)



Less New Capacity in 1927

No Blast Furnaces Added—Open-Hearth Increase Was 630,000 Tons Last Year—Expansion for 1928 Very Light—Few Electric Furnaces Sold

ONLY moderate increases in capacity, both blast furnace and steel-making, for this and the year just ended, are disclosed by a review of the year's activities.

For the second year since the war, blast furnace capacity in 1927 was not increased. Only two furnaces are scheduled for possible completion this year.

In open-hearth construction, new capacity last year at 630,000 tons ranked fourth since the war. Projected additions are the smallest in the last few years.

Expansion in Steel, Iron and Rolling Mill Capacity

COMPARATIVELY lean was the 1927 record of additions to steel melting and blast furnace capacity, with the projected plans for 1928 exceedingly small. Major details of new construction and equipment completed in 1927 or planned for completion in 1928 have been sent in by companies having blast furnaces, steel plants and rolling mills, as well as some foundries. A summary of the data is given in the following paragraphs.

Open-Hearth Capacity Added in 1927

Expansion of open-hearth capacity in 1927 was larger than was indicated in our review a year ago. Only three furnaces were then reported as scheduled for building during 1927 but there were 10 furnaces completed.

The 1927 additions of 10 furnaces have an estimated capacity of 630,000 gross tons per year. This compares with 865,000 tons for 12 new furnaces in 1926. The largest year since the war was 1923, when the total additions were 875,000 tons for 19 furnaces. Last year ranks fourth among the years since the war, as shown by one of the tables. The distribution of the new additions last year is shown in another table.

The additions to open-hearth capacity in 1927 were made by the following companies:

Ford Motor Co., River Rouge, Mich., three 100-ton furnaces; Interstate Iron & Steel Co., Chicago, two 100-ton furnaces; Weirton Steel Co., Weirton, W. Va., one 200-ton furnace; Otis Steel Co., Cleveland, one 125-ton furnace; Timken Roller Bearing Co., Canton, Ohio, one 100-ton furnace; Colorado Fuel & Iron Co., Pueblo, Colo., one 90-ton furnace, and the Bonney-Floyd Co., Columbus, Ohio, one 15-ton furnace for steel castings.

Open-Hearth Units Planned

Only two open-hearth furnaces are scheduled for building in 1928. This is the smallest projected total since the war. The 1928 program compares with 3 in 1927, with 14 in 1926, with 9 in 1925, with 7 in 1924, with 17 in 1923, with 6 in 1922, with 15 in 1921 and with 22 in 1920. One of the war years witnessed the largest scheduled expansion on record—91 furnaces in 1916.

The estimated capacity of the two furnaces, planned for completion this year, is 125,000 gross tons of ingots per year. The smallest projected capacity on record, previous to this, was 217,500 tons for six furnaces in 1922. During peace years the largest contemplated additions were 3,100,000 tons for 88 furnaces in 1913, while the war maximum was 4,515,000 tons for 72 furnaces in 1917.

The additions to capacity planned for 1928 are two 100-ton furnaces now under construction by the Wisconsin Steel Co., Chicago, at its South Chicago plant.

Several companies rebuilt and increased the capacity of their open-hearth furnaces last year, one company changing a 100-ton furnace to one of 200 tons capacity and other companies materially enlarging older units.

Additions to Open-Hearth Capacity Since the War

Year	Annual Capacity, Gross Tons	Year	Annual Capacity, Gross Tons
1919	625,000	1924	375,000
1920	675,000	1925	585,000
1921	247,500	1926	865,000
1922	227,500	1927	630,000
1923	875,000		

No Increase in Blast Furnaces Last Year

For the second year since the war, no new blast furnaces were built. Last year three were projected, but the building of one was rendered unnecessary and the other two are still unfinished.

The 1927 record of no additions to blast furnace capacity duplicates the record in 1923 when none was built. In 1926 there were six new furnaces put in blast, constituting a record since the war, so far as productive capacity is concerned. In 1920 also six new furnaces were finished. The capacity of the six furnaces in 1926 was 1,255,000 tons, while that of the six in 1920 was estimated at 875,000 tons. In 1919 only two furnaces were added with one in 1921, with two in 1922 and with one each in 1924 and 1925.

The record for new blast furnaces completed in any peace year was nine in 1912, with the war record at 14 in 1917.

New Blast Furnaces in 1928

Only two furnaces are under construction for possible completion in 1928. This compares with three in 1927, with nine in 1926 and with five during the three years 1921 to 1923. The record for those projected in any one year was 25 in 1917 with the peace-time record in recent years at seven furnaces in 1913. The capacity of the two furnaces under construction is estimated at 440,000 gross tons. They are the two furnaces at the Fairfield Works of the Tennessee Coal, Iron & Rail-

Increase in Open-Hearth Capacity

	No. of Furnaces	Annual Capacity, Gross Tons
Completed in 1927:		
Independent companies	10	630,000
United States Steel Corporation	0	......
Total	10	630,000
Projected for 1928:

road Co., in Alabama, which were under construction a year ago.

Several Furnaces Rebuilt and Enlarged

A number of companies, particularly the Bethlehem Steel Corporation and the United States Steel Corporation, have rebuilt and enlarged a number of their blast furnaces. The Donner Steel Co., Buffalo, rebuilt its No. 2 furnace, increasing its annual capacity from 180,000 tons to 216,000 tons. The Reading Iron Co., Reading, Pa., augmented the capacity of its Keystone furnace about 25 per cent.

Abandoning and scrapping of blast furnaces continued last year. On Jan. 1, 1927, there were 371 furnaces on the active list. On Jan. 1, 1928, the number stands at 357, indicating a dropping of 14 furnaces during 1927.

The chief features of the reports of the various companies on new construction completed or planned are as follows:

The Steel Corporation

NEW construction and improvements completed during 1927 and under way as of Jan. 1, 1928, by subsidiary manufacturing companies of the United States Steel Corporation, are as follows:

Carnegie Steel Co.

Completed

Edgar Thomson Works: Four open-hearth furnaces rebuilt.

Duquesne Works: Modernizing 4 hot blast stoves at blast furnace No. 5.

Homestead Works: Installing 44-in. and 54-in. blooming mills, 36-in. roughing mill, 28-in.-32-in. structural and 52-in. universal structural mills in lieu of obsolete mills.

Carrie Furnaces: Blast furnaces Nos. 3 and 4 rebuilt, with auxiliary ore handling facilities.

Ohio Works: Improving operating facilities at open-hearth plant; 15 waste-heat boilers at open-hearth plant.

Upper Union (Youngstown) Works: Electrifying mills, replacing steam power.

McDonald Mills: New 12-in. strip mill.

Mingo Works: Eight 1200-hp. gas-fired boilers in blast furnace No. 2 boiler house.

Houston, Texas: New warehouse and dock.

Under Way

Edgar Thomson Works: Turbo-blowing equipment for 2 blast furnaces, replacing obsolete steam engine equipment; 15,000-kw. turbo-generator and auxiliary equipment in power station.

Duquesne Works: New central boiler plant at blast furnaces.

Ohio Works: Two 1500-ton hot-metal mixers.

Farrell Works: Modernizing rolling mill facilities and power generating equipment, including 24-in. roughing mill and 6000-kw. a. c. turbo-generator.

Clairton Works: Addition to by-product coke plant of four batteries, 87 19-ton ovens each, with tar and ammonium sulphate recovery, benzol plant and gas booster station and auxiliary facilities.

A high-tension electric power transmission system, with necessary sub-stations, is being constructed to "tie in" Edgar Thomson Works, Duquesne Works, Carrie Furnaces, the by-product coke plant at Clairton and National Works of National Tube Co.

Illinois Steel Co.

Completed

South Works: New 40-in. reversing blooming mill in No. 1 rail mill; new merchant bar mill for production of alloy steels; gas engine-driven electric generating unit addition to power station.

Gary Works: New 10-in. and 9-in. merchant mills.

Under Way

South Works: Rebuilding blast furnace No. 10 and 8 hot blast stoves at blast furnaces Nos. 5 and 6; enlarging 14 furnaces at No. 2 open-hearth plant and modernizing auxiliary facilities; two 6000-kw. gas engine-driven electric generating unit additions to No. 1 power station; equipping north end structural mills with electric drives, replacing steam power.

Joliet Works: New boiler plant.

Gary Works: Additional 30,000-kw. steam turbo-electric generating unit in power station.

National Tube Co.

Completed

National Works: Blast furnace No. 2 rebuilt; improved stock handling system at bins of blast furnaces Nos. 2 and 4.

Under Way

Lorain Works: New 32-in. mill for rolling rounds at No. 3 blooming mill; converting No. 3 lap weld mill into a seamless mill; 15,000 kw. steam turbine-driven generator and auxiliaries; extension to blast furnace boiler plant, including three 2500-hp. boilers.

American Steel & Wire Co.

Completed

Newburgh Steel Works: New scrap and mold yards at open-hearth plant.

Newburgh Wire Works: Electrification of Nos. 1 and 2 wire mills.

Cuyahoga Works: Additions to cold rolling facilities.

Central Furnaces and Docks: New boiler house, pump house, 10,000-kw. turbo-generator, electric power transmission line to Cuyahoga Works and main water and sewer lines.

American Works: Continuous wire drawing equipment for fine weaving wire.

Waukegan Works: Billet heating furnace.

Trenton Works: Equipment for making bridge wire.

Worcester, South Works: Rebuilding and improving rolling mills, including new 18-in. billet mill and new 10-in. continuous rod mill.

Worcester, Electric Cable Works: Increasing capacity for manufacture of enameled magnet wire; equipment for manufacture of super-tension power cables.

Under Way

Newburgh Wire Works: Improvements in cold finished bar department.

Cuyahoga Works: New rolling mills for large rods and narrow strips.

Anderson Works: Addition of electric welded fabric department.

Worcester, South Works: Modernizing No. 2 rod mill.

Worcester, Electric Cable Works: Equipment for manufacturing copper strand.

American Sheet & Tin Plate Co.

Completed

Gary Sheet Works: Equipping 2 double sheet mills to make full finished sheets.

Vandergrift Works: New heavy-duty unaflow engine for hot mill and sheet and pair furnaces for mills Nos. 22 to 25 rebuilt; 4 modern stoker-fired sheet and pair furnaces and equipping annealing and pickling department for finishing sheets 66-in. wide.

Scottdale Works: Motor drive for hot mills and rearranging hot mill department; modern bar storage building with electric overhead traveling crane.

Wood Works: 100-ft. continuous open annealing furnace.

National Works: Two annealing furnaces and enlarging annealing building.

Cambridge Works: Addition to boiler plant.

Under Way

Gary Tin Works: Enlargement of plant including installation of new motor-driven continuous mill with auxiliary facilities, increasing finishing capacity.

Wood Works: Motor-driven cluster-type cold mill for rolling highly finished sheets.

Tennessee Coal, Iron & Railroad Co.

Completed

Fairfield Works: Two additional soaking pits and extending building; additional spike, bolt and nut units for rail fastenings department; fifth galvanizing unit at sheet mill; modern gas exhauster and saturator equipment at by-product coke plant.

Under Way

Fairfield Works: Two new blast furnaces Nos. 5 and 6; electric power plant of two 25,000-kw. turbo-generators; addition to by-product coke plant of battery of 63 18-ton coke ovens.

Bethlehem Steel Corporation

THE subsidiary companies of Bethlehem Steel Corporation report the following principal improvements and additions completed in 1927 and under way at the close of the year.

Completed

Bethlehem Plant, Bethlehem, Pa.: 10,000-kw. turbo-generator; two Bethlehem gas-driven blowing engines; five heavy-duty roll lathes and additional machine tools for manufacture of Bethlehem auxiliary locomotives.

Steelton Plant, Steelton, Pa.: One Bethlehem gas-driven generator and gas cleaners; 10 gas producers and two waste-heat boilers at open-hearth plant.

Lebanon Plant, Lebanon, Pa.: Addition to concentrating and sintering plant.

Maryland Plant, Sparrows Point, Md.: 20,000-kw. turbo-generator and boilers; one two-strand pig casting machine; three gas producers and two waste-heat boilers at open-hearth plant No. 2; one row of soaking pits with producers; one 27-in.-24-in. four-stand continuous roughing mill and one 21-in. eight-stand continuous sheet-bar and skelp mill; 12-in. continuous skelp mill; four double sheet mills; 12 tin plate mills and two butt-weld pipe mills.

Lackawanna Plant, Lackawanna, N. Y.: One battery of 57 Koppers coke ovens and gas producers; gas producers for eight furnaces at open-hearth plant No. 1; one 54-in. blooming and two 48-in. Bethlehem structural mills with shipping yard facilities; motor drive for 12-in. bar mill and addition to fabricating shop.

Cambria Plant, Johnstown, Pa.: One battery of 77 Koppers coke ovens; three waste-heat boilers at lower open-hearth plant and lumber mill at car shops.

Coatesville Plant, Coatesville, Pa.: Motor drive for 152-in. plate mill.

Under Way

Steelton Plant, Steelton, Pa.: New stack to replace present "B" stack; coke wharf and screening station at coke ovens and two waste-heat boilers and four gas producers at open-hearth plant.

Maryland Plant, Sparrows Point, Md.: New stack to replace present "A" stack; two turbo-blowers with boiler equipment; four waste-heat boilers at open-hearth plant and two lap-weld pipe mills.

Lackawanna Plant, Lackawanna, N. Y.: Ingot stripper at open-hearth plant; 72-in. cold saw at shipping yard and new rail blooming and roughing mills to replace present mill.

Cambria Plant, Johnstown, Pa.: Three 2-strand pig casting machines and two waste-heat boilers at Franklin open-hearth plant.

Ore Mining Properties

At its ore mining properties, 25 dwellings were erected at the Cornwall Mines, Cornwall, Pa. At the same property a 1200-ft. shaft with railroad spur as well as a crushing and screening plant are under way.

Youngstown Sheet & Tube Co.

THE Youngstown Sheet & Tube Co., Youngstown, completed during 1927 at its various plants, the following construction work:

Campbell Works

Blast Furnace Plant: The enlargement of the hearth on "A" furnace to 20 ft. 6 in. The installation on "A," "B" and "C" furnaces of 6 stage A. G. McKee Co.'s gas washers; a new 10-ton trolley for No. 1 ore bridge.

Coke Plant: A complete drinking water system and installation of electric refrigeration.

Steel Plant: The installation at the sheet mills of a balanced rougher roll drive; also a mechanically operated sheet pack opening machine.

Tube Mills: The installation in the machine shop of a 60-in. planer and a bar shear; the installation in connection with the seamless tube mill of complete threading floor equipment consisting of threading and cutting-off machines, together with necessary tables for the handling of pipe.

General: The installation of an overhead crane in the forge shop; a new employment office was built at the north bridge in Campbell and a new waiting room and gate office was built at the south entrance to the plant.

Struthers Works

A complete new installation for nail washing was installed at the nail mill. A pipe bending machine for the manufacture of conduit elbows has been placed in operation.

Brier Hill Works

A continuous annealing furnace was installed in connection with the sheet mills.

Western Reserve Works

Three continuous annealing furnaces were installed.

Hubbard Works

The enlargement of the hearth on No. 1 furnace to 16 ft. was completed.

In connection with the new Valley Mold & Foundry plant at Hubbard, installation was made of one 800-hp. boiler with complete equipment.

Indiana Harbor Works

Steel Plant: A complete mold cleaning yard was installed at the Bessemer department. Twenty-five additional open-hearth charging cars were put into service. An electrically operated Mesta manipulator was installed at the 28-in. billet mill. A 1000-ton Mesta up-cut shear and accompanying tables were installed at the blooming mill.

General: An extension to the machine shop with the necessary machine tools was completed. Low head pumps were installed at the intake. A modern restaurant with electric refrigeration was completed. The sea wall inclosing the entire plant was completed, together with a quantity of sand fill. An automobile fire truck was put into service for emergency use.

Coke Plant: A complete water treating system was installed at the coke plant boiler house. A 110-ft. extension was added to the coal storage yard. A gas meter for the surplus gas was installed.

Evanston Works

Improvements in operation at the Evanston plant were made by the addition of new size roll machines, pipe straightening machines and equipment for forging and finishing at the union department.

Mayville Works

An electric power shovel was installed at the mines and a complete water treating system was put in.

New construction under way and scheduled for completion in 1928 is as follows:

A power house and boiler house at the Campbell Works. This project will consist of the complete installation of six 2000-hp. B. & W. gas-fired boilers with auxiliary equipment to enable these boilers to be operated with pulverized coal; one 18,000-kw. turbo-generator and three 60,000-cu. ft. turbo-blowers. There will also be installed in connection with the above project, a 9375-k.v.a. frequency changer together with necessary transmission lines.

At the South Chicago Plant, there is under construction, a 70-oven Koppers coke plant complete with by-product equipment.

Republic Iron & Steel Co.

The Republic Iron & Steel Co., Youngstown, reports the following improvements as having been made during 1927 and as under way or contemplated in 1928.

A new open-hearth furnace, rated at 150 tons capacity, was built to replace the old No. 1 furnace at the open-hearth plant at Youngstown.

At the Bessemer and Brown-Bonnell plants at Youngstown, a new electric crane runway was added to the roll shop and a new roll grinder installed. There has also been completed a new chemical laboratory and office building.

At the tube works at Youngstown, testing machines and 40-ft. welding skids have been completed, and a lathe has been added to the machine shop equipment. The remodeling of the four butt weld mills is now under way.

At the coke works at Youngstown, alterations have been completed to the coke screening equipment.

A 200-ton Greenawalt sintering plant has been completed at the Haselton furnaces, Youngstown. New gas burner equipment has been provided for the stoves at No. 2 blast furnace.

At the Republic coke plant, Republic, Pa., the steam-operated plant was replaced last year with an electric power plant.

At the Pioneer blast furnaces at Thomas, Ala., four Heine boilers, 784 hp., were added to the boiler plant; one 3000-kw. generator was added to the electrical equipment and one 75-ton overhead crane was installed at the pig casting machine.

Weirton Steel Co.

The Weirton Steel Co., Weirton, W. Va., completed last year the 200-ton open-hearth furnace which was under construction a year ago. It also changed one of its 100-ton furnaces to a 200-ton unit. This gives the company six 100-ton and five 200-ton open-hearth furnaces.

As announced in THE IRON AGE, Sept. 1, 1926, page 585, the company placed in operation late last year its new 48-in. wide strip mill, with three continuous heating furnaces fired by producer gas. The mill is capable of rolling hot strip up to 48 in. wide. The company states that it is regularly producing 36 in. x 16 gage hot-rolled material. The mill is complete with pickling, cold rolling, annealing and finishing facilities, and is expected to have a productive capacity of about 25,000 to 30,000 tons per month. The company reports that the entire mill is driven by power generated in its central station, located adjacent to the blast furnaces, current being transmitted to the plant under tension of 6600 volts, this voltage being used direct by the main power units, the hot mill having 18,000 hp. connected with the various drives, the other power being stepped down to 550 volts a.c. for cranes, auxiliary motors, etc. Two 1000-kw. sets are also installed, supplying 230-volt d.c. for various applications requiring this voltage. No additional productive capacity is under consideration for building this year.

John A. Roebling's Sons Co.

The John A. Roebling's Sons Co., at its Roebling, N. J., plant, last year completed the building of cleaning house No. 3 and added wire drawing benches in wire mills No. 2, 3 and 4. Heavy wire drawing benches were rebuilt in No. 1 wire mill. Tempering and galvanizing machinery was added and the material handling system was extended. All wire mills and other important buildings were equipped with sprinklers.

At the Trenton plant, Trenton, N. J., the company has nearly completed a new tinning shop. Also additional high-speed stranders were built and installed and a new general office building and a general stores building were completed.

For 1928 a 320-ft. extension to wire mill No. 4 at the Roebling plant is under construction and the galvanizing capacity will be increased. At Trenton a physical laboratory will be erected and there will be installed in it a wire rope testing machine having a capacity of 2,000,000 lb.

American Rolling Mill Co.

The American Rolling Mill Co., Middletown, Ohio, completed last year the improvements which were under way at its Ashland, Ky., and Zanesville, Ohio, plants. Certain improvements and additions which are considered necessary to the rounding out of the company's Butler, Pa., works are under way. Improvements at the company's East Side Works at Middletown, incidental to the adaptation and use of hot metal in the open-hearth department and other contemplated betterments, are reported well under way.

The building of a blast furnace at Ashland, Ky., which was contemplated a year ago, has been made unnecessary at this time because of the purchase of the Norton Iron Works.

Colorado Fuel & Iron Co.

The Colorado Fuel & Iron Co., Pueblo, Colo., added last year a new 90-ton open-hearth furnace to its melting department. It also completed the construction of a 25-in. structural mill consisting of three roughing and one finishing stand; a 10,000-kw. turbogenerator; a plant for punching hot tie plates; a repumping plant; a new quenching station at the coke plant and eight additional precipitators for blast furnace gas. The pig casting machine was rebuilt and the capacity of the sintering plant was doubled. For this year the company has under way five additions to the 25-in. mill warehouse.

Trumbull Steel Co.

The Trumbull Steel Co., Warren, Ohio, made alterations to its No. 1 hot strip mill, converting it into a new continuous mill which has a capacity to roll strip steel up to 30 in. wide. This was placed in operation June 16 and was described in the Sept. 15 issue of THE IRON AGE. To provide a mill for rolling wide material the company widened the rolls of its former No. 1 hot strip mill and added additional rolls, making the complete unit a 10-mill stand. A 45-ft. x 250-ft. cooling bed with necessary shearing and piling equipment was built at the No. 2 hot strip mill. In the cold rolling department a 4-high cold mill was erected with auxiliary equipment for wide strip steel and five double-box annealing furnaces were provided. In the sheet and tin department a continuous open annealing furnace for sheet and strip steel was erected. At the present time the company has under construction alterations to its No. 2 hot strip mill and is installing a No. 2 cold mill for wide strip, together with necessary pickling and other auxiliary equipment and shipping departments.

Otis Steel Co.

The Otis Steel Co., Cleveland, completed and placed in operation a 125-ton open-hearth furnace during the past year. Other additions made to the open-hearth department during the year included a 7½-ton Morgan floor charging machine, one 200-ton ladle crane, two 140-ton steel ladles, thirty 4-box charging cars and a 50-ton track scale. An additional 4-hole soaking pit was built at the blooming mill. Extensions were made to the sheet mill building and a motor control house was built. New equipment added to this department included two continuous normalizing furnaces, six double box annealing furnaces, two single box annealing furnaces, two scrubbers and dryers for the sheet mill, one Mesta pickler, scrubber and dryer for pickler, a 1200-hp. motor drive for sheet mill and 20 roll heaters. A polishing and buffing machine was added to the cold strip mill equipment.

Central Alloy Steel Corporation

The Central Alloy Steel Corporation, Massillon, Ohio, last year made a number of changes and adjustments in its Massillon and Canton plants, which were necessitated by the merging of the Central Steel Co. and the United Alloy Steel Corporation. At the Canton plant a 34-in. 2-high reversing mill was installed behind the blooming mill, a 15-ton electric furnace and a 30-ton ladle were added to the electric furnace department and the open-hearth department was equipped to burn coke oven gas and tar. The blast furnace is now being relined and a Dorr thickener and filter for reclaiming water sludge is being installed. The gas washer is being revamped and automatic straight line control installed. Freyn pressure burners were added to the stoves and the boiler fire boxes were enlarged.

At the Massillon works, the coke oven plant of 49 Koppers ovens and a by-product and benzol plant were completed and put in operation. A Bliss cluster mill was added to the sheet division. Other construction work by the company included the erection of a metallurgical laboratory provided with modern equipment for research work.

Jones & Laughlin Steel Corporation

The Jones & Laughlin Steel Corporation, Pittsburgh, last year completed the erection of the seamless tube mill and a 9500-hp. powdered coal fired boiler plant which was started in 1926. The rebuilding of a 44-in. blooming mill at the South Side works has already been finished. In July last year a car ferry was installed for the purpose of transporting via the river material between the Pittsburgh and Aliquippa plants.

Alan Wood Iron & Steel Co.

The Alan Wood Iron & Steel Co., Philadelphia, last year constructed at its blast furnace department at Swedeland, Pa., two 7-tray, 2-stage gas washers, including filter and sludge thickener. It placed in operation during 1927 its Schuylkill Iron Works at Conshohocken, Pa., consisting of one 32 x 60-in. hot sheet mill, one roughing and one finishing stand with 600-hp. motor. This mill was started last June. The company is installing a 1000-hp. motor on its 54-in. jobbing mill to replace steam driven equipment and expects this to be in operation by Feb. 1, this year.

Central Iron & Steel Co.

The Central Iron & Steel Co., Harrisburg, Pa., last year installed a Blaw-Knox dolomite machine for its open-hearth furnaces and laid a concrete floor with non-skid floor plates in its 42-in. universal mill, as well as completed the powdered coal installation which was started in 1925 which furnishes fuel for all reheating furnaces in the rolling mills. The ingot storage yards of the 126-in. mill and the 42-in. universal mill have been consolidated.

Bourne-Fuller Co.

The Bourne-Fuller Co., Cleveland, completed in July last year the erection of a 10-in. semi-continuous bar mill at its Union plant, this taking the place of an old 9-in. mill which was removed. Extensions were made to the mill building to provide room for the new equipment. The mill consists of 8 continuous and 4 semi-continuous stands. A large 32-ft. billet heating furnace was also erected. In addition the company built at its Union works two 75-ft. x 430-ft. warehouse buildings in which it has provided equipment for fabricating reinforcing bars. This company last year continued its work of electrifying its Upson steel plant. It has under way at the present time the installation of an electric drive for its 11-in. bar mill at its Upson plant. It completed in March the erection of a 4000-hp. reversing motor and a 3600-kw. motor generator set for driving its blooming mill. It is also putting in a 5000-kw. turbogenerator to replace two smaller units. The company last year completed the erection of a turboblower to replace steam blowing engines at its blast furnace.

Timken Roller Bearing Co.

The Timken Roller Bearing Co., Canton, Ohio, completed its new steel plant in 1927 and placed it in operation during the early part of the year. The new steel making department, housed in a new building, is equipped with one 100-ton open-hearth furnace and two 15-ton Heroult and one 7-ton Heroult electric furnace. The 5-ton Heroult furnaces formerly used have been dismantled. Changes were made in the drive on two of the mills. The drive of the 22-in. mill was changed from a rope to a gear drive and a 1500-hp. Farrel-Sykes double herringbone gear was installed. The drive of the piercing mill was changed to a 350-hp. Nuttall single helical unit. Both gear drives have Timken bearings on their shafts.

Donner Steel Co.

The Donner Steel Co., Inc., Buffalo, N. Y., completely rebuilt last year its No. 2 blast furnace, increasing its capacity from 180,000 to 216,000 gross tons per year, and equipped it with an Ingersoll-Rand turboblower, with a McKee top and with coke handling and cleaning apparatus. Early this year a new cold drawing department will be installed, as well as a 25-ton Heroult electric furnace.

Ford Motor Co.

The Ford Motor Co., Fordson, Mich., completed in December, 1927, a 12-in. mill for rolling spring steel. This it is expected will be placed in operation in a few weeks. The Ford company has under erection a 10-in. combination merchant mill for rolling bars, rods and strip steel. This will be completed about July, according to present expectations.

The company completed last year three stationary 100-ton open-hearth furnaces, bringing the total to seven furnaces, the other four being of the tilting type.

Worth Steel Co.

The Worth Steel Co., Claymont, Del., completed last year its new flanging and press shop in which is contained three spinning machines. One of these is claimed to be the largest of its kind in the country, being able to flange circles varying in dimension from ½-in. x 180-in. blank to 4-in. x 56-in. blank. On this machine it is also possible to make heads having a 20-in. straight flange. This department, besides other equipment, has two large open throat presses.

Corrigan, McKinney Steel Co.

The Corrigan, McKinney Steel Co., Cleveland, finished the erection of a 12-in. merchant bar mill, which was placed in operation in February, 1927. This completed this company's finishing mill building program, which included a 10-in. mill completed late in 1926. No other extension work was done last year and the company does not contemplate any new construction work in 1928.

Interstate Iron & Steel Co.

The Interstate Iron & Steel Co., Chicago, added two 100-ton open-hearth furnaces to its melting department last year. Early this year the company expects to complete one 18-in. continuous billet mill which has already been started.

Wisconsin Steel Co.

The Wisconsin Steel Co., Chicago, has under construction at its steel works, located at South Chicago, two additional 100-ton open-hearth furnaces which it is expected will be ready for operation about the middle of this year. No other construction is contemplated this year.

Other Steel Works Additions

The Lukens Steel Co., Coatesville, Pa., last year installed a new 84-in. 4-high tandem plate mill, which has a capacity of approximately 4000 tons per month.

The Gulf States Steel Co., at its Alabama City, Ala., works, plans to install this year four 900-hp. boilers; two 60,000-cu. ft. per min. turboblowers; electric generators of 10,000 kwhr. capacity, together with condensers, water supply reservoir and standpipes. The company also expects to completely electrify the drives on the present rod mill.

The Jessop Steel Co., Washington, Pa., last year installed a 10-in. mill and cold rolling mills which are now in production. A new pickling shop was erected and the electric furnaces department has been considerably expanded.

The Firth-Sterling Steel Co., McKeesport, Pa., has added a Swindell annealing furnace to its equipment during the last year and contemplates adding more units during 1928.

The Laclede Steel Co., St. Louis, last year completed a 5-stand, 4-high continuous 10-in. finishing mill which supplants a 5-stand, 2-high, 10-in. looping mill.

Blast Furnace Construction

ADDITIONS to capacity last year were limited entirely to enlarging and rebuilding old blast furnaces. Some of the improvements reported are as follows:

The Hamilton Coke & Iron Co., Hamilton, Ohio, succeeded the Hamilton Furnace Co. on May 10, 1927. The new company is now relining the blast furnaces and increasing the hearth diameter from 16 to 17 ft. The stoves are being relined to increase the heating capacity and pressure burners are to be added. Improvement of the gas cleaning process is also contemplated. There is under construction a coke plant consisting of 45 new Koppers ovens of the Becker type with complete by-product recovering plant together with a gas holder having a capacity of 5,000,000 cu. ft.

Witherbee, Sherman & Co., Port Henry, N. Y., are increasing the capacity of the sintering plant by the addition of two pans. When this is completed, probably in February or March, the total sintering capacity of the company is expected to be about 2000 to 2200 tons per day.

The Hanna Furnace Co., Cleveland, made several improvements during the year to its blast furnace plant at Detroit, Mich. A new two-strand pig machine was erected and slag pits were installed at both furnaces. New open top pig iron ladles were provided, these having a capacity of 90 tons or sufficient to hold the entire furnace cast. A crane was installed to serve the pig machine and pouring stand and a crane house was erected. An electric locomotive was purchased to handle the ladles.

The Reading Iron Co., Reading, Pa., enlarged the hearth of its Keystone furnace and rearranged the tuyeres, thus increasing the production by about 25 per cent. A new sintering plant was installed at this furnace for treating magnetic concentrates from the company's mine at Wharton, N. J.

The Zenith Furnace Co., Duluth, Minn., has contracted for 41 Koppers coke ovens with a capacity for carbonizing 1000 tons of coal per day. Contracts have also been let for two 10-ton coal bridges and for building an extension to the company's coal dock. It is expected that the new coke ovens will be ready for operation by next fall. It is stated that the improvements will involve an outlay of between $2,000,000 and $3,000,000.

The Toledo Furnace Co., Toledo, Ohio, started the erection last year of a 10,000-hp. boiler plant which is nearing completion. This has three units fired with blast furnace gas and two stoker-fired units. This company during the year installed a second 10,000-kw. turbogenerator in its power plant.

The Shenango Furnace Co., Pittsburgh, completed and put into operation a modern, thoroughly equipped, ingot mold foundry on its blast furnace property at Sharpsville, Pa. This is equipped to turn out 20,000 tons or more of ingot molds per month, taking molten metal from the furnaces.

Additions to Rolling Mills

MOST of the increased capacity for rolling steel was made last year by steel-making companies and details of these improvements are included under the individual reports of such companies. Only a few separate reports were received as follows:

Reading Iron Co., Reading, Pa., placed in operation last year a 16 in.-12 in. Belgian mill for rolling skelp up to 8 in. wide. This mill is equipped with automatic flying shears, weighing devices, etc. The roughing and finishing stands are motor driven and the mill will have a production of about 2500 tons of wrought iron skelp per month. This new mill takes the place of the one at Columbia, Pa., which has been abandoned. A new boiler house at the company's tube works department was completed and placed in operation in 1927. A complete new galvanizing department, including a finishing department for threading and finishing galvanized pipe, is scheduled to be completed this year.

The Oliver Iron & Steel Corporation, Pittsburgh, rearranged and added to its equipment last year for the manufacture of a full line of telephone, telegraph, electric railroad and power construction material.

Extensions to Foundries

FROM reports received, improvements and additions of any consequence to foundries were meager last year. A summary of the reports is as follows:

The Eastern Steel Castings, Newark, N. J., made last year general improvements on its open-hearth furnace for the purpose of making it more suitable for duplexing with the electric furnace. There was also installed sand handling and conditioning equipment serving the foundry by the overhead hopper system direct to the molding machines. A complete floor roller transit and storage conveyor system serving the foundry's entire molding department was added. A special high-speed monorail pouring equipment was also completed, and the chemical and physical laboratory including research department was enlarged. There has been installed a complete roller conveyor system throughout the cleaning department for the continuous movement of castings from the shake-out department to the shipping department.

The Bonney-Floyd Co., Columbus, Ohio, added a 15-ton basic open-hearth furnace to its melting department which gives the company two 15-ton furnaces and two 3-ton acid electric furnaces for its equipment.

The Reading Steel Casting Co., Reading, Pa., expects to purchase during 1928 about $15,000 to $20,000 worth additional machine tools.

The Adirondack Steel Foundry Corporation, Watervliet, N. Y., expects to install in 1928 a small electric furnace for making alloy steel castings.

Sales of Electric Furnaces Not Large in 1927

A SATISFACTORY and complete review of the electric furnace steel industry for 1927 is impossible—due to inability to secure adequate information. Fewer data are available this year than last. Therefore only a partial picture of the general situation can be presented. Such information as is available is based entirely on furnaces sold during 1927.

Duplication of records in recent years is reported by the Pittsburgh Electric Furnace Corporation, Pittsburgh, which sells the Moore or "Lectromelt" furnace. This company states that 25 furnaces of commercial size for use in the domestic iron and steel industry were sold last year. This compares with 18 furnaces in 1926, with 26 in 1925 and with 24 in 1924. There have also been sold eight laboratory size furnaces and six special furnaces which are credited to the ferroalloy and refractory industries.

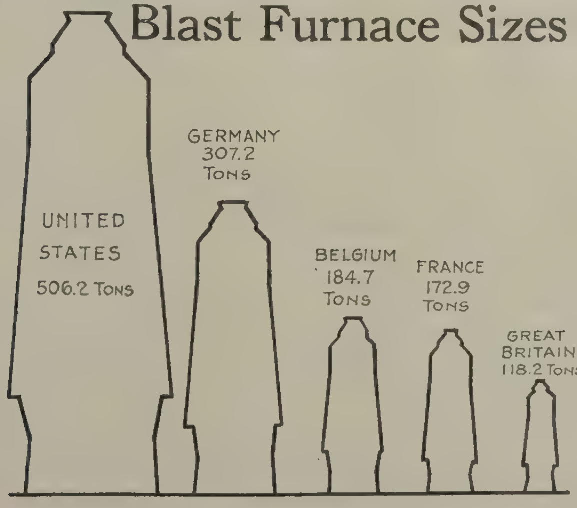
The Pittsburgh company reports that 10 furnaces have been sold for use in foreign countries. This is stated to have been "the most interesting development, all furnaces shipped abroad being in the upper range of sizes built by the company."

The Greene Electric Furnace Co., Seattle, Wash., sold one furnace in 1927 and installed two.

The development on a commercial basis of the high-frequency electric furnace seems to have made progress. The Ajax Electrothermic Corporation, Trenton, N. J., states that several commercial furnaces of 100 to 150 kw. capacity have been sold for use in melting ferrous and non-ferrous metals in England, Sweden, France and Germany. Designs are completed for a 1-ton steel melting furnace. Two 60-kw. furnaces are in use for experimental work in American laboratories.

Unofficial information is conflicting as to the sales of other furnaces. Including the Heroult and Swindell furnaces reported sold from the information available it seems that a fair estimate of the total number of electric furnaces sold last year was not more than 30.

Blast Furnace Sizes of World's Leading Iron Producers



OUTPUT of pig iron by the five principal pig iron producing countries in 1927 showed clearly the variation in size of their average stacks. Dividing total production during the major portion of the year by the average number of furnaces in blast, and the number of days covered in each case, the results are shown in the diagram. German furnaces are averaging larger than formerly, due to recent additions of several stacks comparable in size with current practice in the United States. In the remainder of Europe, however, the size is relatively small. It compares with what the United States was using 30 years ago.

Heights in the diagram are proportional to the average daily tonnage outputs of blast furnaces in the several countries.

Reduction of 20 Per Cent in Steel Export Rates Becomes Effective

WASHINGTON, Jan. 3.—Railroad rates on iron and steel products for export through Atlantic ports from Central Freight Association and Trunk Line territories were reduced 20 per cent, effective midnight, Dec. 30. The new tariffs of the carriers became operative as the result of the action of the Interstate Commerce Commission at a conference on Friday of last week refusing to suspend the schedules. Generally, the reductions amount to approximately $1 per ton. Indicative of the reductions per 100 lb. are the following: Pittsburgh-New York rate, from 25.5c. to 20.5c.; Pittsburgh-Baltimore, from 22.5c. to 17.5c.; Pittsburgh-Philadelphia, from 23.5c. to 18.5c.; Chicago-New York, from 42.5c. to 34.5c., the latter being a cut of $1.60. The schedules are filed as "experimental tariffs" and are intended to stimulate exportation of American iron and steel products. Should the schedules prove effective in this direction it is understood that they will be allowed to remain in effect. Otherwise they will be canceled by the carriers after one year. The tariffs provide for an increase of 25 per cent in the carload minimum weight, going to 45,000 lb. from 36,000 lb.

The carriers were joined by the United States Steel Products Co., exporting subsidiary of the United States Steel Corporation, and independent steel producers in the Pittsburgh and surrounding districts in asking the commission to permit the schedules to become operative. The tariffs were opposed by the Bethlehem Steel Co. and other Eastern steel makers, together with farmers' organizations of Kansas.

Ask Reconsideration of Pipe Rates to Southwest

WASHINGTON, Jan. 3.—Reconsideration of the rates prescribed on wrought iron and steel pipe in its decision in the Consolidated Southwestern cases is asked in a petition filed with the Interstate Commerce Commission by the Prairie Pipe Line Co. and the Prairie Oil & Gas Co. It is asserted that the bases prescribed bring about large increases in the rates on pipe and fittings from all producing points to destinations in the Southwest. The recent oil development in western Texas, the petition says, would be greatly hampered by the increases proposed in transporting pipe and other supplies into that section of the country.

The average of the present rates from Chicago to Kansas, Oklahoma, Arkansas, Louisiana and Texas, the petition declares, is 60.5c. per 100 lb., while it would be 71.5c. under the proposed rates. From St. Louis, the average present rate to the five States is 52.6c., which would be increased to 60.2c. The average of the present rates from Memphis is 48.5c. and would be increased to 54.6c. The average rate from Pittsburgh to Kansas, it is pointed out, would be reduced 3c. and to Oklahoma 0.5c., but to the other three States there would be substantial increases. The average increase to Arkansas, it is said, would be 1.2c.; to Louisiana, 4.8c., and to Texas, 13.2c. Taking the five States, the present average is said to be 83.4c., and it would be 87.6c. under the proposed rates. The average of the present rates from Pittsburgh to the towns from Amarillo to Sweetwater, Tex., inclusive, is 96.9c., and would be increased to $1.032.

European Hematite Agreement Possible

HAMBURG, GERMANY, Dec. 20.—Negotiations have been instituted between the Franco-Belgian Hematite Pig Iron Association, recently reorganized, and German hematite iron producers, relative to an agreement to eliminate competition in foreign markets. Although negotiations for such agreements among producers of other grades of iron have failed, success is expected in this instance.

American Exports Have Shown Substantial Growth

WASHINGTON, Jan. 3.—In an annual review for 1927, Director Julius Klein of the Bureau of Foreign and Domestic Commerce, Department of Commerce, reports that our foreign trade has continued to show remarkable growth in spite of a general lowering of world price levels and a moderate reduction in the activity of domestic business compared with 1926 figures. "Our exports have shown a substantial growth," said Dr. Klein, "indicating a further strengthening of our position in world markets, while the maintenance of our imports at about the same high level as in 1926 indicates the general prosperity of our country."

Great progress is declared to have been made in the past in increasing the efficiency of production. This is held to be true not only of the manufacturing industries but also of agriculture. The truly encouraging feature of 1927 developments, Dr. Klein said, has been the increasing interest shown in regard to methods of improved efficiency in distribution which were said to be still relatively expensive. Dr. Klein declared that there is undoubtedly a large amount of waste which could be eliminated in these processes and that substantial progress has been made toward a more careful appraisal of costs of selling, market analyses, etc.

Fifty Per Cent Increase in Cast Iron Pipe Duty Proposed

WASHINGTON, Jan. 3.—Correspondence has been taken up with the United States Tariff Commission by American makers of cast iron pipe, who are said to have in view the filing of an application seeking an increase of 50 per cent in the present duty on that product, which now carries a rate of 20 per cent ad valorem. Imports of cast iron pipe from France has been a particular source of discussion in the domestic trade. Total imports of this product for the 11 months ended with November, 1927, amounted to 78,657 gross tons, of which 61,002 tons come from France; 14,185 tons from Belgium; 1813 tons from Germany, and 1595 tons from Czechoslovakia. During the corresponding period of 1926 cast iron imports totaled 71,779 tons, while during the 12 months of 1926 the aggregate was 83,873 tons. Of this latter quantity, France supplied 57,354 tons; Belgium, 22,248 tons; Germany, 2013 tons, and Czechoslovakia, 574 tons.

German Ore Imports Have Been Large

HAMBURG, GERMANY, Dec. 20—Imports of metallic ore in the first 10 months of this year totaled more than 20,000,000 metric tons, about double the imports of 1926. The total of iron ore imports was 14,869,957 compared with 7,429,018 tons in 1926; of manganese ore 330,400 compared with 135,583 in 1926 and of copper ore 205,411 compared with 100,538 tons in 1926. Imports of all other ores this year totaled about 170,000 metric tons.

Steel Companies Get Tax Refunds

WASHINGTON, Jan. 3.—Among tax refunds of $103,858,687 made by the Treasury Department to 240,000 taxpayers, as reported by Secretary Mellon to Congress last week, are the following: J. H. Hillman & Sons Co., Pittsburgh, $899,906; American Sheet & Tin Plate Co., Pittsburgh, $54,735; Oliver Iron Mining Co., Duluth, Minn., $56,595; Carnegie Steel Co., Pittsburgh, $38,619; Alloy Steel Corporation, Canton, Ohio, $36,623; Sloss-Sheffield Steel & Iron Co., Birmingham, $36,556; the Link-Belt Co., Chicago, $61,198; Atlas Crucible Steel Co., New York, $127,352; Union Twist Drill Co., Athol, Mass., $159,426; Colorado Fuel & Iron Co., Denver, $669,130; Harrisburg Pipe Bending Co., Harrisburg, Pa., $254,767.

JOHN S. KEEFE, PRESIDENT

Succeeds W. P. Palmer as Head of American Steel & Wire Co.—Other Changes

JOHN S. KEEFE was elected president of the American Steel & Wire Co. on Dec. 28, succeeding the late William Pendleton Palmer. Mr. Keefe had been vice-president and a director of the company since 1901, maintaining headquarters in Chicago. During the illness of Mr. Palmer in the last year he has been active in the administrative affairs of the company, dividing his time between Chicago and Cleveland. He has served as chairman of the traffic committee of the United States Steel Corporation since 1903, and this, together with earlier training in traffic management, has made him one of the best informed men on transportation problems in the steel industry.

Born at Boston on Jan. 24, 1864, Mr. Keefe attended the public schools in that city. In 1880, he went to Milwaukee, and soon after was employed by the Chicago & North Western Railroad. In 1889, he was appointed traffic manager of the Illinois Steel Co., and upon the formation of the American Steel & Wire Co., in 1899 he was made its general traffic manager, holding that position until 1901, when he was elected vice-president. Headquarters of the president of the company will remain in Cleveland, but Mr. Keefe does not plan to give up his residence in Chicago immediately.

Frank Baackes, who last week was named senior vice-president in charge of commercial matters for the American Steel & Wire Co., was made general superintendent of the company at its inception, and the following year was appointed general sales agent. He was later elected vice-president and general sales agent. He was born in Germany in 1863 and came to this country in 1889. He was first employed by the H. P. Nail Co., Cleveland, and in 1894 was in charge of the erection of a wire plant at Beaver Falls, Pa., for the Hartman Steel Co. He was instrumental in the organization of the Salem Wire Nail Co., Salem, Ohio, in 1895, remaining with that company as superintendent and general manager until its absorption by the American Steel & Wire Co. of Illinois in 1897, of which he was general manager until the organization of the present company.

D. A. Merriman, Chicago, has been made general manager of sales and a director of the American Steel & Wire Co. He began his career with the Ludlow-Saylor Wire Co., St. Louis. Resigning as secretary of that company in 1893, he became manager of the Consolidated Steel & Wire Co., in which capacity he had charge of sales, traffic and mills. In 1899, when the Consolidated company was merged in the American Steel & Wire Co. of Illinois, Mr. Merriman went to Chicago as manager of sales for the new company. In 1900, he located in Seattle as president and treasurer of the Puget Sound Wire & Steel Co. When that company was acquired by the American Steel & Wire Co. in 1902, he returned to Chicago as assistant general manager of sales for the latter. He is serving his second term as president of the American Hardware Manufacturers' Association.

Henry A. Barren, the new vice-president in charge of operations of the American Steel & Wire Co., has been general superintendent since 1924. His first employment was with the old Cleveland Rolling Mill Co. at Newburgh, Ohio, when he was 15 years old. Entering Ohio State University in 1882 he spent three years on a special course in engineering and drafting, returning to the rolling mill as a draftsman. In 1891, he became master mechanic of the plant, retaining that position when it became the Newburgh Steel Works of the American Steel & Wire Co. He was made superintendent of the plant in 1901, retaining that position until Jan. 1, 1912, when he was appointed general superintendent of the company's steel works and blast furnaces in the Cleveland and Pittsburgh districts. He held this position until he became general superintendent for the company.

C. F. Blackmer has been made superintendent of wire mills for the American Steel & Wire Co. He has been active in operating capacities in the steel wire industry since 1898 and, like Mr. Keefe, the new president of the company, was originally a railroad man. Born in Worcester, Mass., he was only eight years old when his family went West and located in Colorado Springs, Colo. He grew up in that city and attended Colorado College, Colorado Springs. For the next few years he was in the employ of the Midland Terminal Railway in Cripple Creek and in 1898 went to work for the Washburn-Moen Mfg. Co., Waukegan, Ill., now the Waukegan works, American Steel & Wire Co. He was assistant superintendent of that works in 1922, when he was transferred to Duluth, Minn., to take charge of the construction of the wire plant of the Minnesota Steel Co., of which he became superintendent. He held that position until early in 1925, when he was appointed assistant manager of mills in the Pittsburgh district, embracing the mills at Farrell, Rankin, Braddock, Donora and Allentown, Pa., with headquarters in Pittsburgh. The day he was to have taken that position, George Jewett, Pittsburgh district manager, died and Mr. Blackmer was named to succeed him. In his new capacity Mr. Blackmer will be located in Cleveland.

Leslie J. Gray, who has been appointed assistant to the president, has been assistant to the general superintendent for 15 years. He entered the employ of the company more than 25 years ago in the office of the head of the operating department in Pittsburgh and was transferred to Cleveland when the office was removed there about 18 months ago.

Koppers Co. Buys Coal Properties in West Virginia

The Koppers Co., a subsidiary of the United Gas Improvement Corporation, has purchased the Houston Coal & Coke Co., Houston Collieries Co., Keystone Coal & Coke Co., King Coal & Coke Co., and the Tidewater Coal & Coke Co., all located in West Virginia and covering approximately 27,000 acres for $20,000,000. The new owner proposes to ship coal to New Haven., Conn., via Hampton Roads in 3000 ton colliers. If deeper water is provided by dredging at New Haven, larger boats will be used.

It is expected the Koppers Co. this year will become an active competitor of the New England Coal & Coke Co. and the Providence Gas Co., both of which have dominated the New England by-product foundry and domestic coke market.

Decline in Steel Shipments on Mississippi River

The Mississippi-Warrior (Federal barge) Service handled less iron and steel traffic between St. Louis and New Orleans in the first 10 months of 1927 than in the corresponding period in 1926, according to a statement supplied to THE IRON AGE by the Mississippi Valley Association, St. Louis. Shipments of bars, sheets and structural material totaled 15,223 tons in the 1927 period, as compared with 22,854 tons in the corresponding period in 1926. The movement of pipe in 1927 totaled 12,757 tons, as against 14,453 tons in 1926. No shipments of pig iron and steel blooms were reported in 1927, while 57 tons was handled in 1926. The movement of track material, however, showed a gain, totaling 686 tons for the first 10 months of 1927, as against 272 tons in the corresponding period of 1926.

This Issue in Brief

New records set in world output of iron and steel. Pig iron production was 84.3 million gross tons, a gain of 7.6 millions over 1926. Steel output was 98.2 million gross tons, 6.4 millions over 1926.—Page 67.

Forecasts large building expenditure in 1928. Construction authority believes the total will reach seven billion dollars. 1927, with a total of 6.8 billion dollars, was only 2 per cent under 1926, the record year.—Page 43.

Prosperity of essential industries depends upon absorption of surplus labor by the luxury industries. Unless the labor released by high-production machinery finds gainful employment elsewhere, buying power will be curtailed, says industrial engineer.—Page 53.

Industry is migrating to the Indiana-Ohio-Michigan section. The march of industry is not necessarily westward, for the West, as well as the East, has contributed to the industrial growth of these three States. The center of industry is now near Columbus, Ohio.—Page 30.

Handling materials by machinery, rather than by men, characterizes American foundries, says foreign foundryman. Americans have been quick to sense the savings to be made by mechanical-handling, inasmuch as more than 100 tons of materials must be handled for every ton of castings produced. —Page 33.

Smaller enterprise has as good, if not better, possibilities for reduction of real costs than has the very large establishment. Overhead sometimes gets topheavy in the big organizations. The small manufacturer has better control of labor, and can adjust his product and manufacturing processes more quickly and economically to changes in market conditions.—Page 21.

Leadership by the ablest men is the greatest factor in American industrial supremacy, says foreign manufacturer. Here, with freedom from castes, the fittest naturally rise to the top. Europe is hampered by the selection of leaders by birth, rather than ability.—Page 32.

Automotive industry may have greatly increased output in 1928. A production of 4.5 to 5 million vehicles is predicted. The previous record was made in 1926, with slightly less than 4.3 millions. 1927 output was 3,357,000.—Page 45.

Losses are only increased by clinging to the idle hope that peace-time volume will fill up war-time excess plant capacity. Economic position of industry will be strengthened by scrapping surplus, obsolete equipment, and abandoning unprofitable and unnecessary manufacturing capacity.—Page 42.

No business, small or large, can be conducted efficiently without a budget. The small business can install a budget more easily than can a large one. It will then have facts, rather than mere opinion, by which to chart its course.—Page 26.

Keep your gains or losses on material purchases in a separate account. Speculations in materials should not be permitted to throw the operating account and the cost system out of gear, but should be entered directly in the capital account.—Page 26.

"Finance" may take in its sails in 1928, while "industry" expands, reversing the experience of 1927. Business may expand in 1928, in spite of some recession in stocks and bonds, says Dr. Haney. Deflation of "finance" will be brought about by higher interest rates.—Page 12.

Demand for better steel has been a blessing in disguise to steel makers. The standards of making steel have been raised so much in recent years that tonnage producers are now turning out steel which, not many years ago, would have been furnished by a maker specializing in high grade steel. —Page 38.

Should steel contracts be made binding? Sellers declare that profits are dangerously low and that they need the protection of contracts fixed both as to price and tonnage. But purchasing agent declares that in present era of short term buying industral purchasers need the cooperation the current form of contract gives them.—Page 62.

Brighter prospects for steel jobbers in 1928. Mills have found that small orders are costly to handle, and the tendency is to let this business go to the jobber.—Page 48.

Early improvement in general business is forecast by Dr. Haney. The P-V Line points upward. Commodity prices are not likely to show a sharp advance nor a large decline. They may advance somewhat in the early part of 1928, then recede a little, and then show irregular recovery.—Page 77.

1927 rolled steel output was **8 per cent below 1926,** the record year. Estimated output 32,039,000 gross tons. Building construction was greatest consumer, taking 22 per cent of total. Railroads took only 19 per cent, as contrasted with 23.5 per cent in 1926.—Page 6.

1927 pig iron output 7.8 per cent under 1926. Production was 36.4 million gross tons. Steel ingot output totaled 43,250,000 gross tons, 8 per cent under 1926, the record year.—Page 3.

Steel Marketing in 1928

CLEARLY a pivotal point in steel trade prosperity in 1928 will lie in marketing practices, which are to undergo an interesting and indeed crucial test. Tonnage is not to be considered a market factor in the sense that obtained in the old days, when there were wide variations in output from year to year. When we see the fairly uniform production of the past five years, under variant trade conditions, we conclude that even with some slackening in general business steel tonnage would hold up quite well. On the other hand there is no visible chance that for this one year, at least, demand can so expand as to test the productive capacity. Steel ingot production last year was approximately 75 per cent of 58,000,000 tons, which was reported as "theoretical capacity" for the beginning of that year.

The tonnage of 1928 is likely to fall within such limits that it will not in itself exert much influence upon the price situation. This will have to be handled by the producers themselves, by more enlightened methods and a greater spirit of cooperation. Everything is now set at the opening of the new year for display of ability in these directions.

In five important lines—bars, shapes, plates, sheets and wire nails—price advances have been in the making, each product presenting its own case as to how soon actual invoice prices will equal the higher levels named. Thus the circumstances of substantial tests have already been set up.

Producers need to consider not only the individual attitudes of sellers as to price maintenance, but also the machinery by which prices are quoted, involving both the differentials or extras for size, gage, etc., in lines which are supposed to have a "base price," and also the extras to be charged on retail lots shipped by mills.

In some lines producers have recently proceeded by the cut and try method. Some extras for smaller quantities have been set up and shortly afterward modified, presumably on account of opposition by buyers. It ought to be found possible to develop in each line such extras as would not be onerous upon buyers and at the same time would protect producers from loss in making small-lot shipments. A difficulty in some products has been that the manufacturing consumer and the jobber are in different positions as to the quantity of a size required at one time, and thus a schedule of quantity extras that does not bother the average manufacturer may be quite objectionable to the jobber.

When, as in strips, there is a published list of size and gage extras and a wide variety of base prices is quoted in the open market, it is obvious that something is wrong. Such a list presupposes a uniform base price. By sufficiently long practice the principle has been established in some lines, notably in merchant bars. In 1926 it developed that with the existing schedule of gage differentials in sheets, related to 28 gage as base, there was more shading on the heavy than the light gages. The sheet industry thereupon set up new differentials, based on 24 gage, as of Sept. 1, 1926, and the matter was corrected.

Along these and related lines there is opportunity for much constructive effort in 1928. Improvement in steel marketing conditions should come from within the steel producing industry.

How Thrifty Are We?

SAVINGS of the American people in the banks and trust companies are well over $26,000,000,000, according to the savings bank division of the American Bankers' Association, this amount comparing with about $24,700,000,000 a year ago. Of the addition to national savings for the year, approximately $1,300,000,000, something like $750,000,000 represented interest on the sum already on deposit, leaving only a little over $500,000,000 to represent new deposits. The gain of $1,300,000,000 is the lowest in 12 years.

It is estimated that the premiums paid in 1927 for life insurance were considerably in excess of such payments in 1926. Building and loan savings and the purchase of corporate securities by corporate employees are also expected to show increases for 1927.

These data are becoming the subject of editorial and other comment to the effect that the American people are increasingly thrifty and are adding increasingly to their resources.

Obviously such deductions do not follow at all from the facts, which need not be questioned. A man's wealth is seldom measured by the magnitude of his bank balance. The latter is a crystallization of credit available for immediate needs. His wealth is in documents representing ownership of land, mines, buildings, factories, railroads and interests in going business concerns.

Even the deposits which give to some people credit to their account in a savings bank must be invested by the bank, directly or indirectly, in some form of real wealth. It is only the forms of real wealth that appear in a national inventory. The deposits in savings banks, or in any other banks, do not so appear at all. The answer to the inquiries whether we are nationally gaining in wealth, whether we are saving enough, whether we are sufficiently thrifty, etc., must therefore be how much we are gaining in inventory. Unfortunately the status of economic science does not permit the giving of such an answer, at least not with precision and certainly not year by year.

We may have such a paradox as gaining in savings bank deposits, life insurance, etc., and losing in national wealth. The explanation of this would be that savings bank deposits are the expression of the thrift of a certain class of people. It may be that one class is thrifty while another class is not. Indeed, one class may gain at the expense of another class. The factors that are commonly recognized as being evidences of thrift may not be so at all in national terms.

World Steel Output at New High

NEW records in the world's pig iron and steel output, and in exports as well, were made last year, due to the expansion of the industries of Europe. Several features stand out in the survey, found on other pages, covering all producing countries.

Pig iron no longer lags. At 84,280,000 gross tons for the year, the 1913 or pre-war record is exceeded for the first time, the margin being about 6,560,000 tons, or nearly 8.5 per cent. The 1927 total was larger than that of 1926 by 6,610,000 tons.

In steel the new world total was 98,200,000 tons, topping the previous record of 91,790,000 tons in 1926 by 6,410,000 tons, or about 7 per cent. The growth in the world's steel needs is emphasized by the contrast between last year and 1913. Steel production is 31 per cent, while pig iron is only 8.5 per cent, larger than that of the pre-war year.

Expansion in Europe—not in the United States—accounts for the 1927 records. While American production shrank, the European output was about 10,000,000 tons larger in both pig iron and steel than in 1926, more particularly due to increases in Germany and Great Britain.

For the second time since the war, exports of the six leading nations were larger than in 1913, establishing a new record at 20,590,000 tons. This compares with 17,710,000 tons in 1926 and contrasts with 16,190,000 tons in 1913. Especially interesting is the fact that, although imports for all the six countries were at a new high for the year, the excess of exports over imports was back to the level of the pre-war year.

With the European industry on a more nearly normal basis, with the outlook for the American industry good, and with world-wide interchange of products broader than in many years, the world's steel industry enters 1928 with brighter prospects than have marked the beginning of any year since the war.

Problems of Big and Little Business

SINCE the major articles in this Annual Review Number are written by leaders in the respective fields, it is reasonable to deduce from them broad conclusions about the condition of the metal-working industry. A review of all these contributions (together with a few which must be printed next week) shows that 1927 continued the progress toward efficient production which has marked recent history.

More rapid, more accurate machines have been built and installed and the capacity of existing plant measurably increased by refinement in detail. More power is continually being harnessed; production costs are trimmed by labor-saving devices of many sorts. The total result is that most American manufacturers can produce much, can easily produce more than they can sell easily—in other words our manufacturing capacity is over expanded. Plant and labor are working less than full time.

Hence the importance of salesmanship. Engineers and production men who can increase output are plentiful; but sales managers who can dispose of the output in old fields or recognize commercial possibilities in new ones are not so plentiful. Intense competition for the existing market has frequently driven prices down to a point where profits are unsatisfactory. Even though production costs are lowered, selling costs are increasing. Market investigations, sales promotion service work, and all the expensive incidentals required to get and hold a customer have increased apace. Hence the development of trade associations, so that whole industries can meet competition shoulder to shoulder. Hence the invention of "consumer credit" or instalment buying of luxuries under a new name.

Here are our two problems in a nutshell: Surplus manufacturing capacity; excessive selling costs.

They involve a third, which just recently has been attracting attention, namely, underemployment. With every labor-saving refinement in a mechanism comes a decreased demand for labor—usually it is the least skilled that is eliminated. An unexampled amount of road building and engineering projects have absorbed much common labor, but with the continuing "mechanization" of construction plant, of the farm, the coal mine, the factory and the home, there are fewer and fewer places for him to turn his hand. It is to be hoped that this condition will not work back through the higher grades of labor, with decreased consumer income and decreased consumer credit, in a vicious cycle.

Stating these problems by no means implies a pessimistic outlook. Knowing the difficulties in advance, a wise man can lay plans to avoid them or surmount them. And these problems are not exclusively the problems of big business. The problems of the large corporation and of the small independent are different in degree rather than in kind.

In the past the small manufacturer has frequently been obscured by the glare of the giant concern. Mr. Ford and Mr. Schwab are always news. Furthermore, statisticians are fond of pointing out that 70 per cent of the output in such and such an industry comes from 13 per cent of the plants. The implication is that the 30 per cent of output and the 87 per cent of plants are quite unimportant. As a matter of fact their extinction would precipitate a most acute industrial and sociological crisis.

While it is impossible to say where the small business ceases to be small and becomes big, an organization whose manager can call the employees by name is doubtless to be classified as "small." Many things about such an enterprise compare favorably with the great industrial giant. It may be equally efficient and prosperous. It is far more flexible, and it may develop to the highest degree individual initiative and satisfaction in a sound achievement. The problems and successes of the small business man are worth more attention than they have been given in the past, for these enterprising and independent Americans are the salt which savors the whole mass.

Billion-Ton Mark in Pig Iron

BEFORE the end of 1928 the United States will have made one billion gross tons of pig iron. At the average rate of the past five years it would require only 27 years to make this amount, but 63 years ago a million tons was made in a year and 29 years ago ten million tons. Having come years ago to occupy a very wide field, iron tonnage has not increased of late by the percentage rates that used to obtain.

The Abram S. Hewitt rule of doubling in pig iron tonnage every ten years worked very well through 1910, but since that year gains have been smaller. The following table gives an interesting retrospect, showing ten-year totals of production, with percentage increases one decade over the preceding:

Ten Years Through	Production, Gross Tons	Increase, Per Cent
1867	8,760,578	.....
1877	19,984,735	128.2
1887	42,484,217	112.6
1897	82,236,958	94.0
1907	181,470,757	120.6
1917	284,708,343	56.9
1927	335,250,000	17.7

No geometrical rate of increase could be followed indefinitely. Naturally when the industry became large it had to slow down in its percentage gains, but another principle also operated. For a long time there was little if any improvement in quality. Then as a large proportion of the pig iron came to be put into steel instead of into iron castings, and the steel came to be improved, the strength and service per ton increased, and it is now increasing. The total usefulness, therefore, is not to be measured merely by tons. The increase is much greater than the tonnage increase.

A corresponding comparison of production of steel ingots and castings is as follows:

Ten Years Through	Production, Gross Tons	Increase, Per Cent
1907	153,361,430	230.7
1917	293,799,823	95.7
1927	397,800,000	35.4

SHEET MERGER EFFECTED

Empire Steel Corporation Is Formed by Consolidation of Six Ohio Companies

THE Empire Steel Corporation has been incorporated to acquire and combine the plants of six Ohio sheet mills, for the merger of which plans have been under way for some time. The combined assets of the merged companies are approximately $20,000,000. The companies to be merged are the Mansfield Sheet & Tin Plate Co., Mansfield; the Ashtabula Sheet Steel Co., Ashtabula; the Empire Steel Co., Cleveland, and the Falcon Steel Co., Thomas Sheet Steel Co. and the Waddell Steel Co., Niles.

W. H. Davey, president Mansfield Sheet & Tin Plate Co., and the Ashtabula company, who has taken a leading part in bringing about the merger, will be president and managing executive of the new corporation. Others officers have not been selected. The location of the headquarters has not been definitely decided upon, but for the present the main office will be in Mansfield.

Approval of the merger is still to be obtained from the stockholders of the different companies, and when this is obtained the final work of consolidation will be carried out. The new company will have 60 mills, 58 being sheet mills and two, jobbing mills, and will have an annual capacity of 400,000 tons of finished products. It will also have four 75-ton open-hearth furnaces, a 32-in. blooming mill and a 24-in. sheet bar mill, these steel-making facilities being a part of the plant of the Mansfield Sheet & Tin Plate Co. All the other companies going into the combine have non-integrated plants.

The new corporation will have 550,000 no par common shares and 150,000 preferred shares of $100 par value. It has secured a charter in Ohio, and its incorporators include W. H. Davey, J. D. Waddell, Niles, president Waddell Steel Co.; A. W. Wheatley, Lima, president Empire Steel Co.; W. A. Thomas, Youngstown, Thomas Sheet Steel Co.; Lloyd Booth, Youngstown, president Falcon Steel Co.; M. C. Robinson, Ashtabula, a director of the Ashtabula Sheet Steel Co.

The tentative balance sheet of the Empire Steel Corporation as of Oct. 31, shows current assets of $3,682,820, property and equipment, $15,759,589, and other assets, $236,958. The current liabilities were given as $1,255,907, and other liabilities include first mortgage bonds, $3,650,000, and paid in surplus, $2,062,432. The capital stock to be presently issued, under the plans of the merger, includes $7,430,200 in preferred stock and 206,243 shares of common stock at a declared value of $25 a share, or a total of $5,156,081.

Ground was broken Dec. 27 for two steel buildings that will house new equipment to be installed by the Gulf States Steel Co., at its Alabama City, Ala., works. The equipment was listed in THE IRON AGE of Dec. 29, 1927, page 1794.

FABRICATED STRUCTURAL STEEL

Awards Total 36,000 Tons, With 11,500 of New Projects Up for Bids

In the last week of the year structural awards amounted to 36,000 tons, including 14,000 tons for the Chicago *Daily News* building, and 3500 tons for a bridge over the James River. Fresh projects totaled only 11,500 tons, of which the largest is 4300 tons for the Woolworth Building in Chicago. Awards follow:

New York, 5000 tons, bank building at Wall, Hanover and Beaver Streets, to Post & McCord.

New York, 1500 tons, addition to Bellevue Hospital, to Levering & Garrigues Co.

Brooklyn, 1500 tons, theater, to Hedden Iron Construction Co.

Brooklyn, 500 tons, building for E. R. Squibb & Sons, to McClintic-Marshall Co.

Utica, N. Y., 500 tons, Utica State Hospital, to an unnamed Pittsburgh fabricator.

Cleveland, 340 tons, pathological hospital for Western Reserve University, to National Iron & Wire Co.

Norfolk, Va., 3500 tons, James River Bridge, to Virginia Bridge & Iron Co.

Greenville, N. C., 165 tons, building for Greenville Foundry Co., to an unnamed local fabricator.

New Orleans, 200 tons, building for Standard Oil Co. of Louisiana, to an unnamed local fabricator.

Laurel, Miss., 350 tons, addition to Mason Foundry Co. plant, to Ingalls Iron Works Co., Birmingham.

Birmingham, tonnage being estimated, additions to city schools, to Southern Steel Works.

Chicago, 14,000 tons, building for *Chicago Daily News*, to American Bridge Co.

Chicago, 600 tons, shed for Bohnsack Brick Co., to Midland Structural Steel Co. and Blaw-Knox Co., local.

Henry County, Iowa, 325 tons, highway bridge, to Clinton Bridge Co., Clinton, Iowa.

Johnson County, Iowa, 250 tons, highway bridge, to Des Moines Steel Co., Des Moines.

State College, Pa., 860 tons, recreation building for Penn State College, to H. K. Ferguson Co.

Pittsburgh, 1000 tons, two tow-boats for Union Barge Line, to Midland Barge Co., Midland, Pa.

New Albany, Ind., 600 tons, four barges for E. T. Slider, to Midland Barge Co.

St. Marys, W. Va., 2000 tons, bridge over Ohio River, to American Bridge Co.

Cincinnati, 2000 tons, six barges for Barrett Line, to Riter-Conley Co.

Los Angeles, 550 tons, science building for University of California, to Baker Iron Works.

Hollywood, Cal., 450 tons, First National Bank, to Baker Iron Works.

Redlands, Cal., 100 tons, school auditorium, to Baker Iron Works.

Structural Projects Pending

Inquiries for fabricated steel work include the following:

St. Albans, Vt., 350 tons, three State bridges.

Bayonne, N. J., 100 tons, transmission towers for Standard Oil Co. of New Jersey.

Atlantic City, N. J., 150 tons, bridge for New Jersey State Highway Department.

Lancaster, Pa., 700 tons, passenger station for Pennsylvania Railroad.

Pennsylvania Railroad, 350 tons, bridges in Virginia.

Cincinnati, 1300 tons, Eighth Street viaduct, general contract to Foldwell & Ahlskog, Chicago.

Anderson, Ind., 500 tons, storage building, for Delco Remy Corporation.

Chicago, 4300 tons, Woolworth Building.

Chicago, 2500 tons, apartment building on Burton Place.

San Bernardino, Cal., 300 tons, Victorville bridge; F. L. Holser, Los Angeles, general contractor.

Indian Cove, Idaho, 100 tons, Snake River bridge, Perham & Rowe, St. Anthony, Idaho, general contractor.

Lovelock, Nev., 600 tons sheet steel piling for Orena Dam; Jasper-Stacy Co., general contractor.

Swan Valley, Idaho, 300 tons, Snake River bridge; bids Jan. 10.

RAILROAD EQUIPMENT

More Freight Cars Ordered—Three Roads Buy Total of 108 Locomotives

The Southern has ordered 68 locomotives, the Seaboard Air Line 25 and the Texas & Pacific 15, the largest volume of locomotive buying in some time. The Southern will build 750 freight cars in its own shops, in addition to 4750 cars ordered of car builders, and the Mobile & Ohio has bought 700 cars.

Atchison, Topeka & Santa Fe has ordered 100 caboose cars from the American Car & Foundry Co. and 100 extension side dump cars from the Magor Car Co.

Pittsburgh Railways have ordered 15 interurban passenger coaches from the St. Louis Car Co.

Central Railroad of Georgia is inquiring for 500 flat cars.

Texas Pacific is in the market for 10 caboose cars.

Seaboard Air Line has ordered 25 locomotives from the Baldwin Locomotive Works.

The Mobile & Ohio has ordered 700 freight cars, of which 250 box cars and 200 flat cars will be built by the Mount Vernon Car Mfg. Co. and 250 gondolas by the General-American Car Co. Six passenger cars also were awarded to the Bethlehem Steel Co.

Texas & Pacific has ordered 15 Texas type locomotives from Lima Locomotive Works, Inc.

Southern Railway System will build 500 gondola and 250 caboose cars in its own shop, the Lenoir Car Works. These are in addition to 4750 cars, which were reported awarded last week. This railroad has also ordered 55 Mikado, five Pacific and eight mallet-type locomotives from the Baldwin Locomotive Works.

Swift & Co. are inquiring for 300 steel underframes for refrigerator cars.

Illinois Central expects to make inquiry for 20 suburban coaches.

New York, Westchester & Boston has ordered 15 motor-passenger cars from Osgood Bradley Car Co., in addition to 10 reported last week.

Nashville, Chattanooga & St. Louis has inquired for two combination baggage and passenger cars and two baggage cars.

REINFORCING STEEL

Government Building in New York Takes 3000 Tons—3700 Tons in Cincinnati Viaduct

With 3000 tons for an Appraisers' Stores building in New York, the total of awards of reinforcing steel in the week was more than 6600 tons. Award is expected shortly of 3700 tons for a viaduct in Cincinnati. Awards follow:

Birmingham, tonnage being estimated, two city schools, to Connors Steel Co.

Chicago, 500 tons of rail steel bars, Medinah Athletic Club, to Inland Steel Co.

St. Louis, 300 tons, warehouse for Stix, Baer & Fuller Co., to Missouri Rolling Mills Corporation.

New York, 3000 tons, United States Appraisers' Stores; from Turner Construction Co., general contractor, to Jones & Laughlin Steel Corporation.

Elizabeth, N. J., 800 tons, concrete decks for bridge over Arthur Kill from Elizabeth to Howland Hook, S. I.; from Albert Volk, Inc., general contractor, to E. T. Edwards, Columbia, Pa.

Silvis, Ill., 100 tons of rail and billet steel bars, building for Swift & Co., to Olney J. Dean & Co.

Pittsburgh, 200 tons, Grant Building, to Truscon Steel Co.

Los Angeles, 1740 tons, for Puddingstone Dam, to Soule Steel Co.

Reinforcing Bars Pending

Inquiries for reinforcing steel bars include the following:

Cleveland, 400 tons, sales and service building for Packard Motor Car Co.

Cleveland, 500 tons, tunnel work for Cleveland Union Terminals Co.

Toledo, 400 tons, store building for Lamson Brothers.

Cincinnati, 3700 tons, Eighth Street viaduct, general contract to Foldwell & Ahlskog, Chicago.

Texarkana, Ark., 225 tons, Union Station.

Iron Output at Low for the Year

Estimated December Daily Rate Fell 1319 Tons or 1.5 Per Cent from November—No Gain or Loss in Furnaces —Year's Total at 36,232,300 Tons

WITH a large proportion of the data estimated by the producing companies, figures collected by wire on Tuesday, Jan. 3, show that pig iron production in December fell off from November 1319 tons per day or nearly 1.5 per cent. This compares with a decline in November of 1531 tons per day or 1.7 per cent.

The estimated December output was 2,695,755 gross tons or 86,960 tons per day for the 31 days as compared with 2,648,376 tons or 88,279 tons per day for the 30 days in November. As in 1926 so in 1927, December was the smallest month of the year.

The December preliminary estimate of 2,695,755 tons brings the year's total to about 36,232, 300 tons of coke pig iron, comparing with 39,070,470 tons in 1926, and with 36,403,470 tons in 1925.

Four furnaces were blown in and four blown out or banked during December, leaving the total active on Jan. 1 at 170 or the same as on Dec. 1. Of the four furnaces blown in last month, three were independent steel company stacks and one was a merchant furnace.

Pig Iron Production by Districts, Gross Tons

	Dec. (31 days)	Nov. (30 days)	Oct. (31 days)	Sept. (30 days)
New York and Mass.	199,726	212,778	232,422	222,485

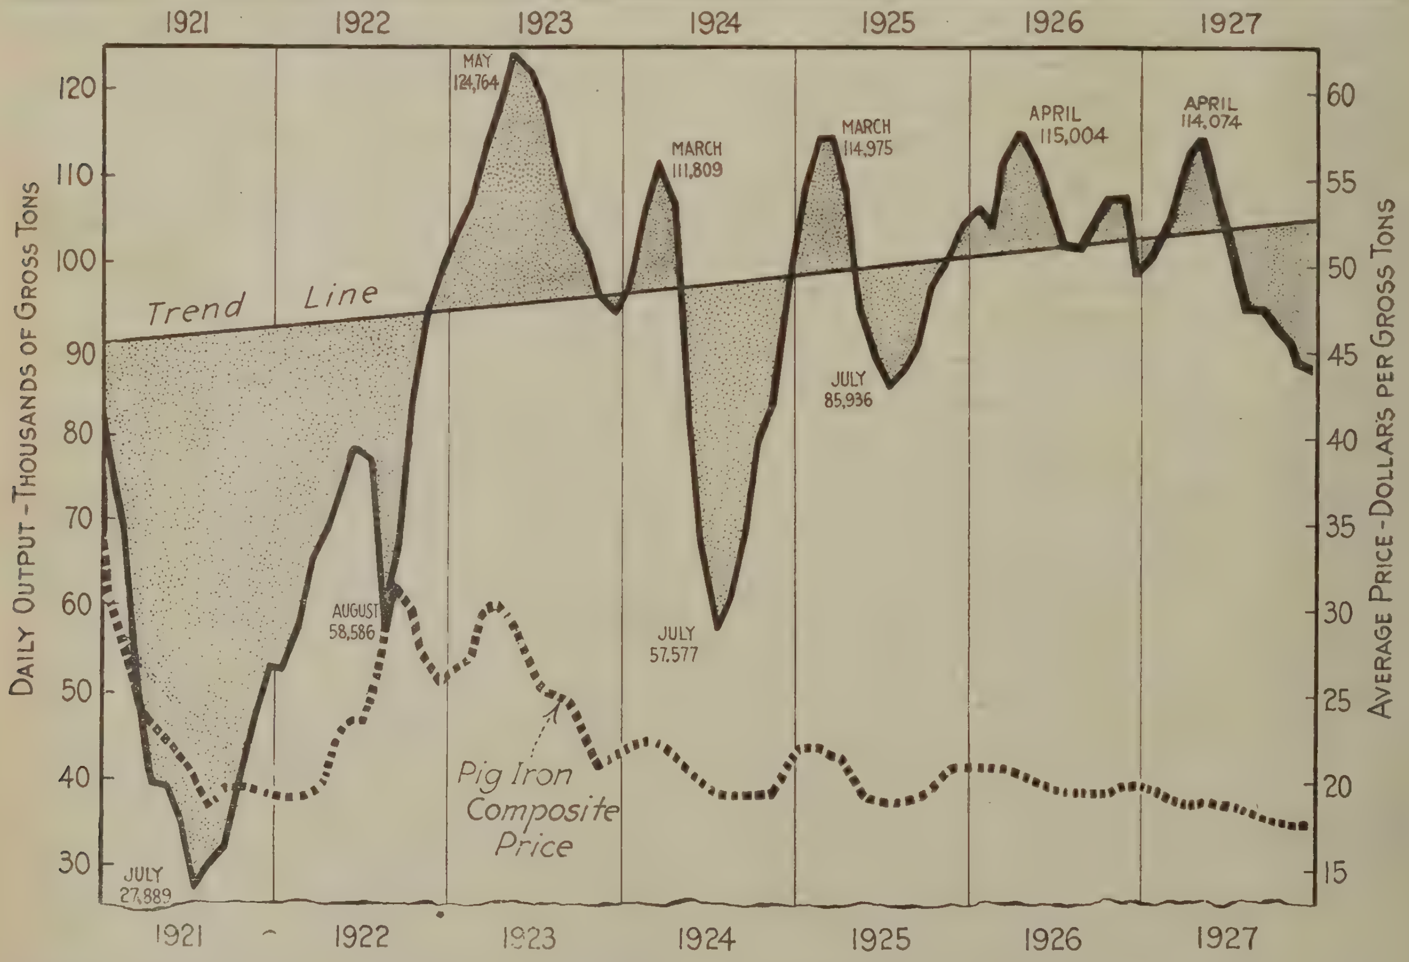
Nov.	3,023,006	3,236,707	2,648,376
Dec.	3,250,448	3,091,060	2,695,755
Year*	36,403,470	39,070,470	36,232,306

*These totals do not include charcoal pig iron. The 1926 production of this iron was 163,880 tons.



Daily Pig Iron Output in December was 1.5 Per Cent Less Than in November; Composite Price Again Decreases Slightly

Inclined line represents the gradually increasing theoretical needs of the country, and shows that production is now below the so-called normal. Dotted line represents THE IRON AGE *composite price*

One merchant furnace and three independent steel company stacks were shut down.

Possibly Active Furnaces Reduced

One Bessemer furnace of the Tennessee Coal, Iron & Railroad Co. in Alabama and the Genesee furnace of the M. A. Hanna Co. in New York have been scrapped. This reduces the number of possibly active stacks from 359 to 357.

Furnaces Blown In and Out

Four furnaces were blown in during December, as follows: The Sharpesville furnace in the Shenango Valley, one furnace at the Cambria plant of the Bethlehem Steel Corporation in western Pennsylvania, one furnace of the National Tube Co. in northern Ohio and one furnace of the Colorado Fuel & Iron Co. in Colorado.

Four furnaces were blown out or banked during December: One furnace at the Lackawanna plant of the Bethlehem Steel Corporation and one Donner furnace in the Buffalo district in New York; the Perry furnace in western Pennsylvania, and one River furnace of the Corrigan-McKinney Steel Co. in northern Ohio.

BRITISH OUTLOOK FAVORABLE

European Competition Diminishing—Year's Imports of Iron and Steel Estimated to Have Exceeded Exports

(*By Cable*)

LONDON, ENGLAND, Jan. 2.

THE year opens with the iron and steel markets quiet following the holidays, but prospects regarded more hopefully as Continental competition with Cleveland producers has diminished. There are 40 Cleveland furnaces in blast and producers expect to blow in additional furnaces in the near future. Hematite iron is quiet and makers are inclined to grant small concessions on large tonnages. Foreign ore continues idle.

Steel business has been quiet as most works were closed during the past week. Some makers are moderately well booked, especially on small bars, rivets, bolts and nuts. Mills rolling plates and angles, however, are insufficiently well sold to permit of full time operation.

Tin plate has been moderately active, although most works closed for a compulsory holiday under the restriction of output plan. Inquiry is good and the outlook distinctly more favorable.

Galvanized sheets are quiet and demand is confined to small lots. Japanese buying of black sheets is light.

The British production of steel ingots and castings last year is estimated at 9,200,000 gross tons and of pig iron, 7,300,000 tons. Imports of iron and steel are estimated at 4,400,000 tons and exports at 4,310,000 tons. Clyde shipbuilding last year totaled 254 vessels of 464,200 tons.

Continental markets are dull following the recent holidays and quotations are inclined toward easiness with buying light. Apprehension of a suspension of German mills is less general.

The European Rail Makers' Association has booked 60,000 tons of rails for South Africa, 75,000 tons for Argentina and 52,000 tons for Belgian railroads, all for delivery through the current year. Polish output in October was 62,000 tons of pig iron, a post-war high record, and 104,200 tons of steel ingots. Production of rolled steel totaled 87,500 tons.

Will Occupy Utica Heater Plant

The Richardson & Boynton Co., New York, manufacturer of hot air furnaces, has made an arrangement with the National Radiator Corporation by which it will occupy the plant of the Utica Heater Co. at Whitesboro, N. Y. By this deal the former company will acquire 23 acres near Utica, formerly owned by the Heater company, together with a modern plant, rail sidings, etc. The Richardson & Boynton Co. recently closed temporarily its plant at Dover, N. J.

OBITUARY

B. F. Jones, Jr.

BENJAMIN FRANKLIN JONES, JR., chairman of the board of directors Jones & Laughlin Steel Corporation, Pittsburgh, died at his home in that city Jan. 1, after an illness of two weeks. He was in his office on Dec. 17 and apparently in good health.

B. F. JONES, JR.

The corporation of which Mr. Jones was the head was founded by his father, the late B. F. Jones, more than 75 years ago. From small beginnings it has grown to its present position as one of the largest independent steel companies. Unaffected by the mergers and consolidations which have taken place in the industry in the last 25 years, the business has remained one of the outstanding examples of corporate ownership kept largely within the families of the founders.

Mr. Jones was born April 21, 1868, on the North Side, Pittsburgh, then the city of Allegheny. His early education was in private schools in Pittsburgh, after which he took a preparatory course at St. Paul's School, Concord, N. H., and entered Princeton University, graduating in the class of 1891.

Upon his return from college Mr. Jones entered the employ of Jones & Laughlin, Ltd., the name of the company at that time, as treasurer and member of the board of managers. He had previously spent much time at the mills and furnaces and had a sound working knowledge of the making of iron and steel. In 1907, four years before the death of his father, Mr. Jones became president of the company and continued in that position until the organization of the Jones & Laughlin Steel Corporation, when he became chairman of the board.

Following the example of his father, who was chairman of the Republican National Committee in 1884, Mr. Jones, Jr., had been active in politics, having served as chairman of the electoral college of Pennsylvania after the campaign of 1908. Another of his interests outside of business was art, his collection of paintings being one of the most notable in Pittsburgh. He was a member of the First Presbyterian Church, Pittsburgh, and was trustee of the Allegheny General and Mercy hospitals. Although most of his business life was devoted to the manufacture of steel, he also was a director of the Union Trust Co. of Pittsburgh and the National Union Fire Insurance Co.

His club memberships included the Pittsburgh, Duquesne, Union and Allegheny clubs of Pittsburgh; the University, Princeton, Racquet and Tennis clubs of New York; the Union Club, Cleveland; Nassau Club, Princeton, and the University Club, Chicago.

In 1892 Mr. Jones was married to Sue D. Dalzell, who survives him, together with his son, B. F. Jones, 3d, and his daughter, Mrs. J. O. Burgwin; two grandchildren, Susan and Virginia Burgwin; and his sisters, Mrs. Alexander Laughlin, Jr., Mrs. Elizabeth M. Horne and Mrs. W. W. Willock, all of Pittsburgh.

MARSHALL W. WARREN, founder and president of the M. W. Warren Coke Co., St. Louis, and a pioneer coke dealer of the Middle West, died recently at his home in Webster Groves, St. Louis. He had retired from business several years ago.

Iron and Steel Markets

January Mill Operations Increase

Good Specifications in Sheets, Bars, Plates and Shapes—December Pig Iron Output Less—New World's Record in Steel

THE last month of 1927 was like December, 1926, in being the lowest of the year in steel production, but January operations now promise a larger rate of gain over December than the 8 per cent of a year ago. There was the difference, however, that 1926 had a definite autumn upturn, whereas last year there was a practically uninterrupted decline in output, beginning with April. How far this can now be compensated for is a matter of first interest to the entire trade.

Good specifications in the last 10 days of December, especially in sheets, bars, plates and structural material, have started mills at a fair January rate, many now having orders that will keep them going through the month. In the past few days the automotive industry has specified for January requirements of sheets and strips.

Companies reporting to the National Association of Sheet and Tin Plate Manufacturers now have about 750,000 tons of unfilled orders, the largest total on record apart from 800,000 tons early in 1920.

Price uncertainties remain, especially in view of the large amount of plate, shape and bar tonnage carried into the first quarter at 1.75c., which was the basis of coverage before the Carnegie advance of $1 a ton on Nov. 10.

Yet it is not overlooked that some forces may be working for a more stable market in the coming year. No new blast furnaces were built last year, and very little new steel capacity. Consolidations are likely to lessen the scramble for tonnage, and in the sheet industry the handling of the continuous mill patent situation may prove a constructive factor.

Pig iron production in December was 2,695,755 tons, or 86,960 tons a day, against 2,648,376 tons, or 88,279 tons a day in November. In December, 1926, the daily rate was 99,712 tons, or nearly 15 per cent more than last month's.

Four furnaces went out in December and four went in, leaving the number in blast on Jan. 1 at 170. One year previous it was 204.

For the year 1927 pig iron output was about 36,400,000 tons, with charcoal iron estimated. This compares with 39,373,000 tons in 1926.

In production of steel 1927 was fifth among the leading years. The estimate of 43,250,000 tons of ingots shows a drop of 3,700,000 tons from 1926, the high year, but 1927 exceeded the average of the four years that preceded it.

While American pig iron and steel production fell off last year, Europe added close to 10,000,000 tons of each product to its performance of 1926. We estimate the world's steel ingot output last year (21 countries) at 98,200,000 tons, or 6,500,000 tons more than in 1926, the previous record year. The pre-war record was 74,830,000 tons in 1913.

Following the placing of 11,500 freight cars in the pre-holiday week, three railroads have bought a total of 108 locomotives, the Southern ordering 68, the Seaboard Air Line 25 and the Texas & Pacific 15. The Mobile & Ohio has taken 700 cars, while the Southern has authorized the building of 750 cars in its own shops, in addition to 4750 recently placed with car builders.

Award of 14,000 tons of structural steel for the Chicago *Daily News* building brought up the total of fabricated steel contracts in the last week of the year to 36,000 tons. Only 11,500 tons in fresh projects appeared, the largest being 4300 tons for a building in Chicago. A viaduct in Cincinnati will take 3700 tons of reinforcing steel and a Government building in New York calls for 3000 tons.

Pig iron buying, largely by the automotive industry, continues heavy in the Cleveland district, and good orders were booked at St. Louis. Chicago district furnaces enter 1928 with the largest first quarter backlogs in several years. Prices show little change, but in some districts stocks of merchant iron on furnace banks are still heavy, those in the Valleys being estimated at 250,000 tons.

Heavy melting scrap has advanced 50c. a ton at Pittsburgh and 25c. at Chicago. Pittsburgh and particularly Ohio centers west of that city have been feeling the heavy diversion of scrap from Detroit to Buffalo, and dealers, fearing a shortage, have been scouring the market for material to cover sales made in December.

A 5000-ton Central Western transaction in gravel fluorspar indicates a market of $15 for good lots, or $1 a ton below recent quotations.

Apart from the H. C. Frick Coke Co., Connellsville coke operators generally are back to the November, 1917, scale of wages, which gives $5 for day labor, or $1 a day less than has been paid lately. In both coal and coke supply continues in excess of demand.

Exports of iron and steel products from the United States in 1927 were about 2,190,000 tons. This is the largest total in six years, exceeding 1926 by 1 per cent. Tin plate and wrought pipe were leading products, followed by structural material, rails and black sheets.

Imports of iron and steel into the United States in 1927 fell off 33 per cent from 1926, due mainly to a decrease of over 300,000 tons in pig iron. The total was about 750,000 tons compared with 1,111,000 tons the previous year. But rolled and finished steel increased 25,000 tons or 7 per cent over 1926.

Neither of THE IRON AGE composite prices is changed this week, pig iron remaining for a fourth week at $17.54 and finished steel for a third week at 2.314c. a lb. Both are far below last year's opening prices—pig iron by $2.17 a gross ton, and finished steel by $2.78 a net ton.

A Comparison of Prices

On export business there are frequent variations from the above prices. Also, in domestic business, there is at times a range of prices on various products, as shown in our market reports on other pages.

Pittsburgh

Sheet Mills Have Heavy Unfilled Orders—Scrap Advances—Wages Cut in Connellsville District

PITTSBURGH, Jan. 3.—As the new year opens, price uncertainties mar an otherwise satisfactory steel market. Order books are heavy in practically all finished products, with the exception of pipe, and even in that product some makers are well supplied with line pipe business. There has been a notably heavy accumulation of orders in sheets. Companies reporting to the National Association of Sheet and Tin Plate Manufacturers have approximately 750,000 tons of unfilled orders, the greatest total with one exception—in 1920, when they were close to 800,000 tons—since the compilation of steel statistics. The American Sheet & Tin Plate Co., which represents most of the tonnage outside of the association, also had a heavy December, and the sheet branch of the industry as a whole has orders sufficient to provide a very heavy operation over most of this quarter. Orders on makers' books for tin plate, cold-finished steel bars, strips and hot-rolled bars are in good volume, and since the automobile industry has not yet figured in the orders to the full extent of expectations, much tonnage is expected to come from that source when the motor car builders swing into production schedules.

But there is less satisfaction with prices than with the volume of business. The advance long expected in bars, plates and shapes has failed to materialize, and the explanation is to be found, it is said, in over-anxiety for orders on the part of some mills, which resulted, practically, in the extension of fourth quarter contracts into this quarter. These mills appear to have accepted specifications with a promise to date shipments in keeping with buyers' requirements.

Sheet makers have little business carrying the prices they now are asking. Indeed, acceptance of business at concessions from that level has continued into the past week. Bookings of strip steel have been at low prices, and makers are obligated some distance ahead. Distributers of wire nails are too well supplied or covered to permit makers to do much business at the advances they announced a month ago. It will be another month before makers of cold-finished steel bars get the benefit of higher first quarter prices.

There has been, however, a betterment in the rate of steel plant operations, although they are still about 10 points below the level that manufacturers regard as one permitting appreciable reduction of costs, i.e., between 75 and 85 per cent of capacity.

The scrap market in the past few days has been showing fresh strength. Centers west of Pittsburgh have been feeling the diversion of scrap from Detroit to Buffalo, and the lack of reserves is reflected in a demand from those centers that has given the Detroit market a sharp upswing. Locally, dealers who are short of the market are scurrying to cover in the fear that supplies on which they had relied will go to Ohio. A mill in this district with rather exacting requirements has paid $16 for heavy melting steel, and dealers are paying $15.50 to cover sales made at the latter figure.

The coldest weather of the winter has failed materially to strengthen the fuel situation, the interesting feature of which is the posting by important Connellsville district producers of the November, 1917, scale, which cuts day labor from $6 to $5 per day.

Pig Iron.—Almost all melters of iron are covered on their requirements for this quarter, and current business consists merely of the carload lot purchases of those who rarely anticipate their needs. W. P. Snyder & Co. make the average prices of basic iron shipped from Valley furnaces in December $17 and, of Bessemer, $17.56, as compared with $17 and $17.75 in November.

Prices per gross ton, f.o.b. Valley furnace:

Basic	$17.00
Bessemer	17.50
Gray forge	16.75
No. 2 foundry	17.25
No. 3 foundry	16.75
Malleable	17.50
Low phosphorus, copper free	27.00

Freight rate to the Pittsburgh or Cleveland district, $1.76.

Ferroalloys.—Heavy deliveries against expiring contracts for ferromanganese in the past month have given leading users a good supply for the present, and current demands do not amount to much. There are still some large users who have not made formal contracts for their first half requirements. Shipments of spiegeleisen on contracts also have been heavy in the past month, and specifications for shipment this month are fairly large. Consumers are well covered on their 1928 requirements of ferrosilicon and are specifying well.

Semi-Finished Steel.—All indications point to a good movement of billets, slabs and sheet bars in the next few months, as the sheet, tin plate and strip makers are well supplied with orders and, having bought semi-finished steel rather sparingly in the past four or five months, carried only moderate supplies into the new year. As makers of wire rods have generally covered their customers for this quarter at $40, base Pittsburgh or Cleveland, the new quotation of $42 is likely to apply only on small or pick-up tonnages. Plates are not any too firm at 1.80c., and skelp, which is influenced largely by the plate market, is barely steady at that figure.

Bars, Plates and Shapes.—Mills in this and the Youngstown districts start the new year with a good volume of bar orders, chiefly in specifications on unshipped fourth quarter tonnages, but they are not so well supplied with shape and plate orders. Seemingly, some of the users of plates have concluded that they will be able to do as well on price on new purchases as in ordering out unspecified fourth quarter tonnages. There is accordingly a little more pressure for plate orders than for business in bars and shapes, and prices of plates are beginning to show irregularity. Competition has disclosed willingness on the part of some makers to go $1 a ton below the present market price on first quarter contracts and even lower on definite shipment orders. With railroad car buying on the increase, plates might have been expected to show greater firmness.

Rails and Track Supplies.—Mills are well supplied with rail business, but makers of track accessories still have room for additional orders. Demand for light-section rails still reflects the depression in the soft coal industry, but there has been no weakening in prices.

Wire Products.—Makers are well supplied with orders for nails, but activity is yet to develop in the other products. The general quotation on nails is now $2.55, base, Pittsburgh or Cleveland, and first quarter contracts have been written at that price, with the new card of extras, but it cannot be said to be established, since distributers are too well supplied to be in need of new stocks.

Tubular Goods.—Line pipe is still the backbone of pipe mill operations, as it is a little early for much buying of buttwelded pipe for building and construction work, and demand for lapwelded pipe for oil and gas well drilling awaits the formulation of plans by companies engaged in drilling.

Sheets.—Makers do not lack orders. Indeed, most of them have heavy order books, but they appear to have been built up on low-priced tonnages and the advance named on first quarter contracts, it is feared, will not become effective on any considerable part of the shipments during this quarter. Good demands are coming from the railroad car builders and from the agricultural implement industry, but business from the motor car builders, notably from the Ford Motor Co., is disappointing. Mill operations increased materially with the approach of the end of the year and are now above 80 per cent of capacity. Shipments in the past month, however, ran well under production and sales, which explains the large order books.

Tin Plate.—A material increase in mill operations denotes heavier specifications for contract tonnages of packers' can sizes. The American Sheet & Tin Plate Co. is operating above 70 per cent of capacity, and the Weirton Steel Co., between 70 and 75 per cent. Tin plate prices are very firm. Preferentials to large buyers are smaller than in other years, and there is more insistence on the full quotation to small consumers.

Cold-Finished Steel Bars and Shafting.—Makers are well satisfied with the course of the market, having obtained generous releases against unspecified fourth quarter tonnages and having secured first quarter contracts, carrying an advance of $2 a ton, from almost all buyers who order that way. Prices below 2.20c., base Pittsburgh, on new business disappeared with the end of 1927.

Hot-Rolled Flats.—Makers are well supplied with business but are not satisfied with the prices at which it was taken, particularly on wide strips, which have continued to encounter rather strong competition from plates. On the plate mill gages of strips it is still necessary to match 1.75c., base, for plates to get orders. Makers regard the general market as 2.10c. to 2.20c., base, for very narrow material, 2c. for widths of 2 in. to 6 in. and 1.80c. to 1.90c. for 6 in. and wider.

Cold-Rolled Strips.—The market appears steady at 3c., base (1 up to 3 tons), with a deduction of 25c. per 100 lb. for lots of 3 tons or more of one size, one temper and for shipment at one time. On orders where the requirements are strict and the amount bought is small, makers are still asking and getting 3.15c., base. Some makers have written no first quarter contracts at these prices, feeling that better prices will be obtainable before the quarter ends.

(*F.o.b. Morgantown or Pittsburgh*)

(Per package, 20 x 28 in.)

8-lb. coating I.C.	$11.40	25-lb. coating I.C.	$17.30
15-lb. coating I.C.	14.45	30-lb. coating I.C.	18.75
20-lb. coating I.C.	15.80	40-lb. coating I.C.	20.85

Alloy Steel Bars

(F.o.b. Pittsburgh, Chicago or Ohio Mill)

S. A. E. Series Numbers		*Base Per* 100 *Lb.*
2100*	(½% Nickel, 0.10% to 0.20% Carbon)	$2.90 to $3.00
2300	(3½% Nickel)	4.00 to 4.10
2500	(5% Nickel)	5.00 to 5.25
3100	(Nickel Chromium)	3.00 to 3.10
3200	(Nickel Chromium)	4.75 to 5.00
3300	(Nickel Chromium)	6.75 to 7.00
3400	(Nickel Chromium)	6.00 to 6.25
5100	(Chromium Steel)	3.00 to 3.10
5200*	(Chromium Steel)	7.00 to 7.50
6100	(Chrom. Vanadium bars)	4.00 to 4.15
6100	(Chrom. Vanad. spring steel)	3.50 to 3.75
9250	(Silicon Manganese spring steel)	3.00 to 3.15
	Carbon Vanadium (0.45% to 0.55% Carbon, 0.15% Vanad.)	4.10 to 4.20
	Nickel Chrome Vanadium (0.60 Nickel, 0.50 Chrom., 0.15 Vanad.)	4.05 to 4.20
	Chromium Molybdenum bars (0.80—1.10 Chrom., 0.25—0.40 Molyb.)	4.00 to 4.25
	Chromium Molybdenum bars (0.50—0.70 Chrom., 0.15—0.25 Molyb.)	3.05 to 3.10
	Chromium Molybdenum spring steel (1 — 1.25 Chrom., 0.30 — 0.50 Molybdenum)	4.50 to 4.75

Above prices are for hot-rolled steel bars, forging quality. The ordinary differential for cold-drawn bars is 1c. per lb. higher. For billets 4 x 4 to 10 x 10 in. the price for a gross ton is the net price for bars of the same analysis. For billets under 4 x 4 in. down to and including 2½ in. squares, the price is $5 a gross ton above the 4 x 4 billet price.

---

*Not S. A. E. specification, but numbered by manufacturers to conform to S. A. E. system.

Rails

Per Gross Ton

Standard, f.o.b. mill	$43.00
Light (from billets), f.o.b. mill	36.00
Light (from rail steel), f.o.b. mill	34.00
Light (from billets), f.o.b. Ch'go mill	36.00

Track Equipment

Base Per 100 *Lb.*

Spikes, 9/16 in. and larger	$2.80
Spikes, ½ in. and smaller	$2.75 to 2.80
Spikes, boat and barge	3.10
Tie plates, steel	2.25
Angle, bars	2.75
Track bolts, to steam railroads	3.80 to 4.00
Track bolts, to jobbers, all sizes, per 100 count,	70 per cent off list

Welded Pipe

Base Discounts, f.o.b. Pittsburgh District and Lorain, Ohio, Mills

Steel Inches	Black	Galv.	Iron Inches	Black	Galv.
Butt Weld					
⅛	45	19½	¼ to ⅜	+11	+39
¼ to ⅜	51	25½	½	22	2
½	56	42½	¾	28	11
¾	60	48½	1 to 1½	30	13
1 to 3	62	50½			
Lap Weld					
2	55	43½	2	23	7
2½ to 6	59	47½	2½	26	11
7 and 8	56	43½	3 to 6	28	13
9 and 10	54	41½	7 to 12	26	11
11 and 12	53	40½			
Butt Weld, extra strong, plain ends					
⅛	41	24½	¼ to ⅜	+19	+54
¼ to ⅜	47	30½	½	21	17
½	53	42½	¾	28	12
¾	58	47½	1 to 1½	30	14
1 to 1½	60	49½			
2 to 3	61	50½			
Lap Weld, extra strong, plain ends					
2	53	42½	2	28	9
2½ to 4	57	46½	2½ to 4	29	15
4½ to 6	56	45½	4½ to 6	28	14
7 to 8	52	39½	7 to 8	21	15
9 and 10	45	32½	9 to 12	16	2
11 and 12	44	31½			

To the large jobbing trade the above discounts on steel pipe are increased on black by one point, with supplementary discount of 5 and 5%, and on galvanized by 1½ points, with supplementary discount of 5%. On iron pipe, both black and galvanized, the above discounts are increased to large jobbers by one point with supplementary discounts of 5 and 2½%.

Note.—Chicago district mills have a base two-points less than the above discounts. Chicago delivered base is 2½ points less. Freight is figured from Pittsburgh, Lorain, Ohio, and Chicago district mills, the billing being from the point producing the lowest price to destination.

Boiler Tubes

Base Discounts, f.o.b. Pittsburgh

Lap Welded Steel		*Charcoal Iron*	
2 to 2¼ in.	27	1½ in.	+18
2½ to 2¾ in.	37	1¾ to 1⅞ in.	+ 8
3 in.	40	2 to 2¼ in.	— 2
3¼ to 3¾ in.	42½	2½ to 3 in.	— 7
4 to 13 in.	46	3¼ to 4½ in.	— 9

Beyond the above discounts, 7 fives extra are given on lap welded steel tubes and 2 tens to 2 tens and 1 five on charcoal iron tubes.

Standard Commercial Seamless Boiler Tubes

Cold Drawn

1 in.	60	3 in.	45
1¼ to 1½ in.	52	3¼ to 3½ in.	47
1¾ in.	36	4 in.	50
2 to 2¼ in.	31	4½, 5 and 6 in.	45

Hot Rolled

2 and 2¼ in.	37	3¼ and 3½ in.	53
2½ and 2¾ in.	45	4 in.	56
3 in.	51	4½, 5 and 6 in.	51

Less carloads, 4 points less. Add $8 per net ton for more than four gages heavier than standard. No extra for lengths up to and including 24 ft. Sizes smaller than 1 in. and lighter than standard gage to be held at mechanical tubes list and discount. Intermediate sizes and gages not listed take price of next larger outside diameter and heavier gage.

Seamless Mechanical Tubing

Per Cent Off List

Carbon, 0.10% to 0.30%, base	55
Carbon, 0.30% to 0.40%, base	50

Plus differentials for lengths over 18 ft. and for commercial exact lengths. Warehouse discounts on small lots are less than the above.

Old Material.—This market has been growing stronger in the past few days, partly as a result of a purchase of a fair-sized tonnage of heavy melting steel by a mill in this district with rather exacting specifications at $16, but chiefly because of nervousness among dealers over the situation that has lately developed in the Detroit market. Considerable heavy melting steel was sold here in December at $14.50 to $15.50. Because of the threat that scrap which they figured on getting will go elsewhere, dealers are now paying $15.50, and even more, to cover sales made at that price or less. Compressed sheets have been sold at as high as $15. Machine shop turnings are weak, but there is firmness in the blast furnace grades.

Prices per gross ton delivered consumers' yards in Pittsburgh and points taking the Pittsburgh district freight rate:

Basic Open-Hearth Furnace Grades:		
Heavy melting steel	$15.50 to	$16.00
Scrap rails	15.00 to	15.50
Compressed sheet steel	14.50 to	15.00
Bundled sheets, sides and ends	13.50 to	14.00
Cast iron carwheels	14.00 to	14.50
Sheet bar crops, ordinary	15.00 to	15.50
Heavy breakable cast	13.00 to	13.50
No. 2 railroad wrought	15.00 to	15.50
Heavy steel axle turnings	13.00 to	13.50
Machine shop turnings		11.00
Acid Open-Hearth Furnace Grades:		
Railroad knuckles and couplers	17.00 to	17.25
Railroad coil and leaf springs	17.00 to	17.25
Rolled steel wheels	16.50 to	17.00
Low phosphorus billet and bloom ends	18.50 to	19.00
Low phosphorus, mill plate	17.50 to	18.00
Low phosphorus, light grade	16.50 to	17.00
Low phosphorus sheet bar crops	17.50 to	18.00
Heavy steel axle turnings	13.00 to	13.50
Electric Furnace Grades:		
Low phosphorus punchings	16.50 to	17.00
Heavy steel axle turnings	13.00 to	13.50
Blast Furnace Grades:		
Short shoveling steel turnings	11.50 to	12.00
Short mixed borings and turnings	11.50 to	12.00
Cast iron borings	11.50 to	12.00
No. 2 busheling	10.00 to	10.50
Rolling Mill Grades:		
Steel car axles	18.00 to	19.00
No. 1 railroad wrought	11.00 to	11.50
Sheet bar crops	17.00 to	17.50
Cupola Grades:		
No. 1 cast	14.50 to	15.00
Rails 3 ft. and under	15.00 to	15.50
Malleable Grades:		
Railroad	15.00 to	15.50
Industrial	14.50 to	15.00
Agricultural	14.00 to	14.50

Fluorspar.—Two good-sized sales of gravel fluorspar to Ohio steel-makers have developed a price of $15 for domestic material, and that price is now the quotable market on the larger tonnages. Some producers did not quote below $16 on the tonnages recently closed and are still naming that price, but it appears to be obtainable only on small tonnages. Steel-makers this winter have not bought so heavily in advance as usual, and consequently competition among producers for what is usually regarded as backlog business is rather sharp.

Warehouse Prices, f.o.b. Pittsburgh

	Base per Lb.
Plates	3.00c.
Structural shapes	3.00c.
Soft steel bars and small shapes	2.90c.
Reinforcing steel bars	2.75c.

Machine bolts, per 100 count	62½ per cent off list
Carriage bolts, per 100 count	62½ per cent off list
Nuts, all styles, per 100 count,	62½ per cent off list
Large rivets, base per 100 lb.	$3.50
Wire, black soft annealed, base per 100 lb.	2.90
Wire, galvanized soft, base per 100 lb.	2.90
Common wire nails, per keg	$2.80 to 2.90
Cement coated nails, per keg	2.85 to 2.95

Bolts, Nuts and Rivets.—Business in bolts and nuts in the past month reached good-sized proportions, firmness in prices having encouraged buyers to specify freely for shipment after Jan. 1. It was the best December several companies here had had in recent years. Revival in railroad car buying has helped demand. Rivets are rather slow, chiefly because so many large users make their own rivets.

Coke and Coal.—Outside of the H. C. Frick Co., which still is paying the scale established Sept. 1, 1922, Connellsville operators generally are back to the November, 1917, scale of wages, or $5 per day for day labor, a cut of $1 per day from what they have lately been paying. This development is not a strengthening factor in coal and coke prices, which remain low and easy also because supplies still exceed demands.

Youngstown

Valley Steel Output Gains—Fear Price War in Automobile Industry

YOUNGSTOWN, Jan. 3.—Steel manufacturers in this district are in the most cheerful mood they have been in for fully six months. Not only was December a good month in orders and specifications, but, for the first time since early in 1927, the trend of steel works and rolling mill operations is definitely upward and the prospect is for further increases in output as motor car builders swing into production on a quantity basis, as they are expected to do in the next 30 days. There is some disappointment that the Ford Motor Co. has not yet brought up the production of its new car to the point of early expectations and that its releases of steel are still light, but that feeling is tempered by a belief that if the orders are not here now they will be later. In general, it is expected that demand for steel from the automotive industry will be greater this year than it was in 1926.

Prosperity in the motor car industry means much to Youngstown steel makers, whose production runs so heavily to the requirements of that industry. The unfavorable feature of the automobile trade is the prospect of a price war among the makers of the lower-priced vehicles. In such an eventuality, it would be merely a case of history repeating itself for the automobile makers involved to seek help from the steel industry in getting the raw materials as cheaply as possible. The kinds of steel going into automobiles, notably sheets and strips, are already moving at such low prices that further recessions would be disastrous.

Good order books have been built up in sheets, strips, wire nails and bars, which, with a fair amount of pipe, business, have contributed to increased plant operations. Based on the number of open-hearth furnaces active, the Youngstown Sheet & Tube Co. is busier than for several months. This company now has 16 of its 24 units here in production. It also is starting up some idle by-product coke oven capacity, evidently to provide additional gas required for the open-hearth furnaces. The Republic Iron & Steel Co. also has a heavier operation, and the Trumbull Steel Co., which recently operated only three of its eight open-hearth furnaces, now has seven active.

The call for pig iron could be much better, as stocks of merchant iron are heavy in both this and the Shenango Valley, estimates placing them at close to 250,000 tons. Not much activity is noted in scrap, but this is explained by the fact that the leading local melters recently acquired a considerable tonnage quietly from regular sources of supply.

Loadings of revenue freight for the week ended Dec. 17, 1927, totaled 868,162 cars, according to reports filed with the car service division of the American Railway Association. This was a decrease of 9438 from the preceding week and a decline of 76,234 compared with the corresponding week of 1926. Total loadings until the above date in 1927 amounted to 50,946,044, compared with 52,338,058 in the corresponding period of 1926 and 50,523,091 in the similar period of 1925.

Semi-Finished Steel, Raw Materials, Bolts and Rivets

Mill Prices of Semi-Finished Steel

Upset hex. cap screws, S.A.E. thread	85 and 5
Upset set screws	80, 10 and 10
Milled studs	70 and 5

Chicago

Steel Mill Output Up to 76 Per Cent—Pig Iron Sales Large

CHICAGO, Jan. 3.—An increased rolling rate in rail mills again accounts for an advance in ingot production, steel mill output now being close to 76 per cent of capacity. Shipping schedules already prepared will allow additional expansion in rail production in the first two weeks in January.

Preliminary estimates by local producers indicate that ingot output in this district in 1927 exceeded 1925 by a fair margin but did not equal the tonnage produced in 1926.

Sales in the past seven days compare favorably with any like period in the last 12 months. Mills took the stand that all contracts made at less than 1.90c., Chicago, would be canceled Dec. 31. Judging by new sales made in the closing month of the year it would seem that the market is fairly well stabilized at the new levels.

Industries that have been active in the early winter months remain busy. A substantial tonnage of steel is already assured from railroad car builders, and the indications are that automobile plants and accessory manufacturers will be well engaged by the middle of this month. Specifications for soft steel bars for delivery immediately after the holidays were heavy, representing close to a 50 per cent gain over the corresponding period a year ago.

The Illinois Steel Co. has added a blast furnace at Gary, bringing the total count of active steel mill stacks to 22 out of 36.

Pig Iron.—This commodity is firm at $18.50 a gross ton, f.o.b. local furnaces, and silicon differentials are well maintained, a condition that did not exist in the fall and early winter months. Buying has been in good volume, and producers in this territory enter 1928 with the largest first quarter backlogs in several years. Taking this into account, sellers look for shipments in January to exceed those in December, which was a fair month notwithstanding the time lost by many foundries because of the holidays. The rate of Northern foundry iron production is steady.

Prices per gross ton at Chicago:

Northern No. 2 foundry, sil. 1.75 to 2.25	$18.50
N'th'n No. 1 fdy., sil. 2.25 to 2.75	19.00
Malleable, not over 2.25 sil.	18.50
High phosphorus	18.50
Lake Superior charcoal, averaging sil. 1.50	27.04
Southern No. 2 fdy. (all rail)	22.01
Southern No. 2 (barge and rail)	20.18
Low phos., sil. 1 to 2 per cent, copper free	$28.50 to 29.00
Silvery, sil. 8 per cent	29.79
Bessemer ferrosilicon, 14 to 15 per cent	46.79

Prices are delivered consumers' yards except on Northern foundry, high phosphorus and malleable which are f.o.b. local furnace, not including an average switching charge of 61c. per gross ton.

Ferroalloys.—This market is quiet except in ferromanganese, in which some scattered contracting is still taking place. Prices are firm at $100, seaboard. Spiegeleisen is dull, and quotations range from $30 to $32, Hazard, Pa., for the 19 to 21 per cent grade.

Prices delivered Chicago: 80 per cent ferromanganese, $107.56; 50 per cent ferrosilicon, $83.50 to $87.50; spiegeleisen, 18 to 22 per cent, $36.76 to $37.76.

Cast Iron Pipe.—On the whole, this market is moderately active. Business closed with contractors during the week reached 5000 tons, and several public utilities have placed small orders. It is reported that St. Louis may buy 4000 tons of 6, 8 and 10-in. pipe. Prices on going business are steady at $28 to $30, Birmingham, for 6-in. and larger diameters. No complaint is heard from buyers regarding deliveries from foundries.

Prices per net ton, delivered Chicago: Water pipe, 6-in. and over, $36.20 to $38.20; 4-in., $40.20 to $42.20; Class A and gas pipe, $4 extra.

Plates.—Swift & Co., Chicago, have come into the market for 300 steel car underframes. In the recent car buying movement about 15,000 cars have been placed on order, and of that number about 9000 will be constructed in shops that are tributary to Chicago district mills. Buyers who have recently placed orders for plates for the construction of oil storage tanks are issuing heavy specifications and are pressing mills for delivery. This market starts the new year with mill prices well fixed at 1.90c., Chicago.

Mill prices on plates per lb.: 1.90c., base, Chicago.

Structural Material.—Of outstanding interest is the award to the American Bridge Co. of 14,000 tons of steel for the *Daily News* Building, Chicago. Other awards include 600 tons for a brick shed in Chicago and two highway bridges, taking a total of 600 tons, for erection in Iowa. As the new year opens small fabricators finds more tonnage in their shops than in the fall months, but much of this work was taken at the expense of prices. Up to the end of 1927 specifications for stock continued to reach mills from fabricators who wished to take advantage of low-priced contracts which producers threatened to terminate Dec. 31.

Mill prices on plain material per lb.: 1.90c., base, Chicago.

Bars.—Specifications for soft steel bars in December exceeded those of the corresponding month of last year by 50 per cent. To some extent this reflected the desire of buyers to take advantage of contracts entered at low prices that terminated with the close of 1927. Contrary to expectations at this time of the year, consumptive demand is increasing. Shipments are going forward against schedules listed by the automotive trade, and the requirements of manufacturers of farm machinery still represent close to capacity production. Mill prices for mild steel bars are steady at 1.90c., Chicago. The iron bar market is quiet, with prices firm at 1.90c., Chicago. Forward contracting in alloy steel bars continues to drag, but prices are more stable and shipments in December were about 20 per cent heavier than in the final month of 1926. Demand for rail steel bars is of moderate size. One Chicago Heights mill will be down this week for repairs to furnaces. Prices are steady at 1.80c., Chicago district mill.

Mill prices per lb.: Soft steel bars, 1.90c., base, Chicago; common bar iron, 1.90c., base, Chicago; rail steel bars, 1.80c., base, Chicago Heights mill.

Reinforcing Bars.—This market is dull. The pending list is of fair size, but sellers have learned by experience that a project may be held in check for a long time before it develops into an order. The Inland Steel Co. has taken 500 tons of rail steel bars for the Medinah Athletic Club building, Chicago. Prices are steady, but they are not up to the levels that the trade recently sought to establish. Awards and new projects are listed on page 91.

Sheets.—December closed with hot mills engaged at only 60 per cent of capacity. Release orders in the hands of producers, however, assure a sharp upturn in output with the end of the holiday season. Prices remain at the levels of a week ago, and deliveries on all finishes are prompt.

Base prices per lb., delivered from mill in Chicago: No. 24 black, 2.95c. to 3.05c.; No. 24 galvanized, 3.75c. to 3.90c.; No. 10 blue annealed, 2.20c. to 2.35c. Delivered prices at other Western points are equal to the freight from Gary plus the mill prices, which are 5c. per 100 lb. lower than the Chicago delivered prices.

Wire Products.—Users of wire products in the manufacturing trade are forwarding heavier releases. Jobbers are also more active and are now making room for stocks that must be in for the early spring trade. Demand for wire nails has improved, and shipments of barbed wire and staples to the Southwest are measurably heavier. Wire mill operations for the country as a whole average close to 70 per cent, or a gain of more than six points in the week. In the East operations are below the average, while in the South more than 70 per cent of capacity is engaged. Mill prices are steady and are shown on page 97.

Bolts, Nuts and Rivets.—Specifications are more liberal, giving further indication that users' stocks are low and that additional quantities will be needed to meet January requirements. Prices are steady.

Coke.—All ovens in this district are lighted, and shipments at the turn of the year show little change. Prices of by-product foundry coke are steady at $9, local ovens, and $9.50, delivered in the Chicago switching district.

Old Material.—A large user of heavy melting steel has taken 10,000 tons at $12.40 per gross ton, delivered. This tonnage was not of a strictly No. 1 grade and will not have to stand the close inspection given material by some buyers. Bidding for railroad lists brings out higher prices each week, and one just closed is not an exception. Heavy melting steel sold by the Santa Fe brought $11.60 a net ton, on track, which is equivalent to $13.50 a gross ton, delivered. As a general rule, the railroads are getting 25c. to $1 above the most recent sales to consumers. The holiday season has dampened the interest of small buyers, and dealers are concentrating on trading in the heavy tonnage grades.

Prices delivered consumers' yards, Chicago:

Per Gross Ton		
Basic Open-Hearth Grades:		
Heavy melting steel	$12.50 to	$13.00
Shoveling steel	12.50 to	13.00
Frogs, switches and guards, cut apart, and miscellaneous rails	13.75 to	14.25
Hydraulic compressed sheets	10.75 to	11.25
Drop forge flashings	9.75 to	10.25
Forged, cast and rolled steel carwheels	15.50 to	16.00
Railroad tires, charging box size	15.50 to	16.00
Railroad leaf springs, cut apart	15.50 to	16.00
Acid Open-Hearth Grades:		
Steel couplers and knuckles	14.25 to	14.75
Coil springs	15.75 to	16.25
Low phosphorus punchings	13.50 to	14.00
Electric Furnace Grades:		
Axle turnings	12.50 to	13.00
Blast Furnace Grades:		
Axle turnings	10.50 to	11.00
Cast iron borings	10.25 to	10.75
Short shoveling turnings	10.25 to	10.75
Machine shop turnings	7.75 to	8.25
Rolling Mill Grades:		
Iron rails	13.50 to	14.00
Rerolling rails	14.50 to	15.00
Cupola Grades:		
Steel rails less than 3 ft	15.00 to	15.50
Angle bars, steel	14.25 to	14.75
Cast iron carwheels	13.50 to	14.00
Malleable Grades:		
Railroad	13.00 to	13.50
Agricultural	12.00 to	12.50
Miscellaneous:		
*Relaying rails, 56 to 60 lb	23.00 to	25.00
*Relaying rails, 65 lb. and heavier	26.00 to	31.00
Per Net Ton		
Rolling Mill Grades:		
Iron angle and splice bars	13.50 to	14.00
Iron arch bars and transoms	18.00 to	18.50
Iron car axles	20.50 to	21.00
Steel car axles	15.50 to	16.00
No. 1 railroad wrought	11.00 to	11.50
No. 2 railroad wrought	11.00 to	11.50
No. 1 busheling	9.50 to	10.00
No. 2 busheling	4.50 to	5.00
Locomotive tires, smooth	12.50 to	13.00
Pipes and flues	8.00 to	8.50
Cupola Grades:		
No. 1 machinery cast	14.00 to	14.50
No. 1 railroad cast	13.00 to	13.50
No. 1 agricultural cast	13.00 to	13.50
Stove plate	11.75 to	12.25
Grate bars	11.50 to	12.00
Brake shoes	11.50 to	12.00

*Relaying rails, including angle bars to match, are quoted f.o.b. dealers' yards.

Cold-Rolled Strip.—Little difficulty is being experienced by producers in this district in maintaining the new quantity differentials. In the main, prices are stronger and are working toward 3.15c. per lb., Cleveland, for lots of 1 to 3 tons. Shipments are heavier and for the month of December showed a gain of about 20 per cent over the preceding month.

Warehouse Prices, f.o.b. Chicago

	Base per Lb.
Plates and structural shapes	3.10c.
Soft steel bars	3.00c.
Reinforcing bars, billet steel	2.20c. to 2.65c.
Cold-finished steel bars and shafting—	
Rounds and hexagons	3.60c.
Flats and squares	4.10c.
Bands	3.65c.
Hoops	4.15c.
Black sheets (No. 24)	3.95c.
Galvanized sheets (No. 24)	4.80c.
Blue annealed sheets (No. 10)	3.50c.
Spikes, standard railroad	3.55c.
Track bolts	4.55c.
Rivets, structural	3.60c.
Rivets, boiler	3.60c.
	Per Cent Off List
Machine bolts	60
Carriage bolts	60
Coach or lag screws	60
Hot-pressed nuts, squares, tapped or blank	60
Hot-pressed nuts, hexagons, tapped or blank	60
No. 8 black annealed wire, per 100 lb	$3.20
Common wire nails, base per keg	$2.90 to 3.00
Cement coated nails, base per keg	2.90 to 3.00

Rails and Track Supplies.—Two Western railroads have placed 20,000 tons of standard-section rails, and miscellaneous orders for track accessories total 12,000 tons. Inquiry for track supplies is heavy. Rail mill operations have expanded, and rolling schedules point to still heavier output in the next two weeks.

Prices f.o.b. mill, per gross ton: Standard-section open-hearth and Bessemer rails, $43; light rails, rolled from billets, $36. *Per Lb.:* Standard railroad spikes, 2.80c.; track bolts with square nuts, 3.80c.; steel tie plates, 2.25c.; angle bars, 2.75c.

Cincinnati

Pig Iron Business Negligible—Sheet Production Improves

CINCINNATI, Jan. 3.—The usual year-end quiet prevails in the pig iron market. Activities in the past week having been almost at a standstill. Aside from the purchase of 1000 tons of foundry iron by a Louisville melter and 225 tons of foundry and charcoal iron by the Louisville & Nashville Railroad, sales have been negligible. The only important inquiry calls for 300 tons, including 50 tons of Bessemer ferrosilicon, for the local works of the Worthington Pump & Machinery Corporation. The price situation is the same as a week ago, with northern Ohio makers holding to a minimum of $16.50, base furnace, and Ironton Producers asking $19, base Ironton. In the South, furnace interests are quoting $16, base Birmingham.

Prices per gross ton, delivered Cincinnati:

So. Ohio fdy., sil. 1.75 to 2.25		$20.89
So. Ohio malleable	$20.14 to	20.89
Alabama fdy., sil. 1.75 to 2.25		19.69
Alabama fdy., sil. 2.25 to 2.75		20.19
Tennessee fdy., sil. 1.75 to 2.25		19.69
Southern Ohio silvery, 8 per cent		26.89

Freight rates, $1.89 from Ironton and Jackson, Ohio; $3.69 from Birmingham.

Finished Steel.—In spite of the holiday season and the inventory period, the finished steel market has been unusually active. Specifications against contracts for bars, shapes and plates have been fairly liberal. Some consumers with tonnage due on old, low-priced contracts asked that deliveries be carried over into the first quarter, but mills declined to grant this privilege. Sales have consisted of numerous small lots for which buyers are paying 1.80c. per lb., base Pittsburgh, on 100 tons or more, and 1.90c. on single carloads. No improvement in structural steel demand is discernible, and fabricators in this district are entering 1928 with a meager volume of orders on their books. Foldwell & Ahlskog, Chicago, have been awarded the general contract for the Eighth Street viaduct, Cincinnati, which will take about 1300 tons of steel. The tendency toward increased activity in the sheet market has continued. A large producer in this territory reports that operations have reached the highest point since last July, and a further stepping up of production is contemplated. While the failure of the Ford plant to attain a good rate of output has been disappointing, other automobile manufacturers have been buying sheets in moderate quantities. A well-rounded demand for sheets from

Warehouse Prices, f.o.b. Cincinnati

	Base per Lb.
Plates and structural shapes	3.40c.
Bars, soft steel or iron	3.30c.
Reinforcing bars	3.30c.
Hoops	4.00c. to 4.25c.
Bands	3.95c.
Cold-finished rounds and hexagons	3.85c.
Squares	4.35c.
Open-hearth spring steel	4.75c. to 5.00c.
Black sheets (No. 24)	4.05c.
Galvanized sheets (No. 24)	4.90c.
Blue annealed sheets (No. 10)	3.60c.
Structural rivets	3.85c.
Small rivets	65 per cent off list
No. 9 annealed wire, per 100 lb	$3.00
Common wire nails, base per keg	2.95
Cement coated nails, base 100 lb. keg	2.95
Chain, per 100 lb	7.55
	Net per 100 Ft.
Lap-welded steel boiler tubes, 2-in	$18.00
4-in.	38.00
Seamless steel boiler tubes, 2-in	19.00
4-in.	39.00

consumers in general is one of the most gratifying developments from the standpoint to local district mills. Since most customers are well covered for first quarter at old prices, the recently established quotations of 2.10c., base Pittsburgh, for blue annealed, 3.75c. for galvanized and 2.90c. for black, are as yet scarcely tested, although several producers report small sales at those figures. The nail market is fairly steady at $2.50 per keg, base Ironton.

Reinforcing Bars.—Foldwell & Ahlskog, Chicago, have been awarded the general contract for the Eighth Street viaduct in this city, which will require 3700 tons of bars. Other pending jobs are small, requiring 100 tons or less. Mill prices are firm, with new billet bars quoted at 1.85c., base Pittsburgh, and rail steel bars at 1.75c., base mill.

Warehouse Business.—Shipments out of local warehouses in the past year were about 10 per cent smaller than in 1926. December was a poor month from the standpoint of sales, although several jobbers declare that business was on a par with that in November. Jobbing houses in Cincinnati and Louisville put into effect on Jan. 1 the new card of extras on nails. Prices in general have accumulated strength in the past 10 days.

Coke.—By-product foundry coke during January will remain at $7.50 per net ton, f.o.b. ovens. Domestic grades also are unchanged, with No. 2 nut selling at $4.50, ovens, walnut at $5 and egg at $5.50. At Detroit, by-product domestic egg coke is well established at $6.50, Detroit ovens, for outside shipment and at $7, delivered in Detroit. The Louisville & Nashville is reported to have bought 525 tons of beehive foundry coke for first quarter delivery. Prices of beehive coke from the Wise County and New River districts are firm. Dealers expect an improvement in foundry coke specifications this month.

Foundry coke prices per net ton, delivered Cincinnati: By-product coke, $9.52 to $9.64; Wise County coke, $7.59 to $8.09; New River coke, $10.09 to $10.59. Freight rates: $2.14 from Ashland, Ky.; $2.59 from Wise County and New River ovens.

Old Material.—Although mills show no signs of willingness to pay higher prices, dealers continue to purchase material on the basis of an anticipated buying movement by consumers. Quotations on all items are firm. The Big Four has a list of 4000 tons, including 2000 tons of scrap rails, and the Norfolk & Western has 6000 tons, both of which close this week.

Dealers' buying prices per gross ton f.o.b. cars, Cincinnati:

Heavy melting steel	$11.50 to $12.00
Scrap rails for melting	11.75 to 12.25
Loose sheet clippings	8.75 to 9.25
Bundled sheets	9.50 to 10.00
Cast iron borings	8.50 to 9.00
Machine shop turnings	8.00 to 8.50
No. 1 busheling	10.50 to 11.00
No. 2 busheling	7.50 to 8.00
Rails for rolling	13.00 to 13.50
No. 1 locomotive tires	13.50 to 14.00
No. 1 railroad wrought	11.00 to 11.50
Short rails	17.00 to 17.50
Cast iron carwheels	12.75 to 13.25
No. 1 machinery cast	16.00 to 17.00
No. 1 railroad cast	13.50 to 14.00
Burnt cast	8.00 to 8.50
Stove plate	9.25 to 9.75
Brake shoes	10.00 to 10.75
Railroad malleable	12.50 to 13.00
Agricultural malleable	12.00 to 12.50

Birmingham

More Inquiry for Pig Iron—Cast Pipe, Coke and Scrap Quiet

BIRMINGHAM, Jan. 3.—Birmingham furnaces enter the new year with an improved outlook. A substantial tonnage is being carried forward and, since Christmas inquiries have been active. The smaller buyers are coming into the market, and sales to this group have been numerous. Sales continue on a $16 base. Furnace operations remain unchanged, 18 stacks being in blast. Nine of these are on foundry, eight are on basic, and one, on recarburizing iron.

Prices per gross ton, f.o.b. Birmingham district furnaces:

No. 2 foundry, 1.75 to 2.25 sil	$16.00
No. 1 foundry, 2.25 to 2.75 sil	16.50
Basic	16.00

Finished Steel.—A good volume of business was booked in December, and the outlook for the first quarter is considered favorable. There has been a gradual improvement in the market for the past two months. Mill prices have not been changed within the past several weeks. Neither the Tennessee company nor the Gulf States Steel Co. has made any change in open-hearth furnace operations. The former is running an average of 11 furnaces, and the latter, four.

Cast Iron Pipe.—After the holiday curtailment, plant operations have been resumed at the same rate as previously. A number of inquiries for first quarter tonnage have been received, but bookings last week were small.

Coke.—Demand is improving slightly but the holiday lull still affects the market, which has been quiet for about three weeks.

Old Material.—Business is slow, and the resumption of regular operations in consuming plants, following Christmas, has not yet been reflected in shipments or orders. There have been no price changes recently.

Prices per gross ton, delivered Birmingham district consumers' yards:

Heavy melting steel	$10.00 to $10.50
Scrap steel rails	11.00 to 11.50
Short shoveling turnings	8.00 to 8.50
Cast iron borings	8.00 to 8.50
Stove plate	13.00 to 14.00
Steel axles	19.00 to 20.00
Iron axles	18.00 to 20.00
No. 1 railroad wrought	10.00 to 11.00
Rails for rolling	12.00 to 13.00
No. 1 cast	14.50 to 15.00
Tramcar wheels	12.50 to 13.50
Cast iron carwheels	12.00 to 13.00
Cast iron borings, chemical	13.50 to 14.00

Philadelphia

Fairly Heavy Specifications For Steel As Old Year Ends

PHILADELPHIA, Jan. 3.—Except for the fact that specifications against fourth quarter steel contracts were fairly heavy in the last few days of the old year, the windup of 1927 and the beginning of 1928 have been uneventful in the local iron and steel market. Most of the Eastern mills have good rolling schedules for the next few weeks, but as the tonnage specified will go to buyers at prices lower than are now being quoted it is quite likely that further ordering will be held at a minimum until low-price shipments are completed.

Pig Iron.—The last week of 1927 was one of the quietest of the year in pig iron. Sales by the active furnaces in this district did not exceed a few hundred tons in each case. The Consolidated Machine Tool Corporation, Wilmington, Del., is inquiring for 300 tons of foundry grades for first quarter. Foundry iron remains at $19, base, furnace. Virginia foundry iron is now quoted at $20 to $20.50, furnace.

Prices per gross ton at Philadelphia:

East. Pa. No. 2 plain, 1.75 to 2.25 sil.	$19.76 to $20.26
East. Pa. No. 2X, 2.25 to 2.75 sil.	20.26 to 20.76
East. Pa. No. 1X	20.76 to 21.26
Basic (delivered eastern Pa.)	19.50 to 19.75
Gray forge	19.50 to 20.00
Malleable	21.00 to 21.50
Standard low phos. (f.o.b. New York State furnace)	23.00 to 24.00
Copper bearing low phos. (f.o.b. furnace)	23.50 to 24.00
Virginia No. 2 plain, 1.75 to 2.25 sil.	24.54 to 25.04
Virginia No. 2X, 2.25 to 2.75 sil.	25.04 to 25.54

Prices, except as specified otherwise, are delivered Philadelphia. Freight rates: 76c. to $1.64 from eastern Pennsylvania furnaces; $4.54 from Virginia furnaces.

Plates, Shapes and Bars.—Consumers and jobbers specified freely against fourth quarter contracts in the last week of the old year. The tonnage which mills put on the books in December ran considerably ahead of that taken in November. Structural steel tonnage probably was larger than that in plates and bars because the new prices on structurals are from $2 to $4 a ton above those which have applied on recent shipments. Very little building work is in prospect at the moment. Plates are now quoted at 2.05c., shapes at 2.08c., and bars at 2.12c., delivered Philadelphia.

Sheets.—Nearly all of the principal users of sheets have covered for a considerable part of their first quarter requirements at prices which ruled before the recent advances. For some weeks, or perhaps longer, the new prices probably will rule only on small purchases. These prices are: 2.90c. for black, 3.75c. for galvanized and 2.10c. for blue annealed, Pittsburgh base.

Old Material.—The scrap market is stronger only as regards the selling ideas of brokers. No transactions have occurred to advance prices, but some brokers have gone "long" of the market with the expectation that the next important sales will be at higher prices.

Prices per gross ton delivered consumers' yards, Philadelphia district:

No. 1 heavy melting steel	$13.50 to	$14.00
Scrap T rails	13.00 to	13.50
No. 2 heavy melting steel	11.00 to	11.50
No. 1 railroad wrought	15.25 to	15.75
Bundled sheets (for steel works)	10.50 to	11.00
Machine shop turnings (for steel works)		11.00
Heavy axle turnings (or equivalent)	12.00 to	12.50
Cast borings (for steel works and rolling mill)	11.00 to	11.25
Heavy breakable cast (for steel works)	15.50 to	16.00
Railroad grate bars		12.50
Stove plate (for steel works)		12.50
No. 1 low phos., heavy, 0.04 per cent and under	18.00 to	18.50
Couplers and knuckles		16.00
Rolled steel wheels	15.50 to	16.00
No. 1 blast furnace scrap	10.00 to	10.50
Machine shop turnings (for rolling mill)	11.00 to	11.50
Wrought iron and soft steel pipes and tubes (new specifications)	13.00 to	13.50
Shafting	17.50 to	18.00
Steel axles	19.00 to	20.00
No. 1 forge fire		11.00
Steel rails for rolling	15.00 to	15.50
Cast iron carwheels		15.50
No. 1 cast	16.00 to	16.50
Cast borings (for chemical plant)	15.00 to	15.50

Boston

Pig Iron Sales Recede—New England Foundry Melt at 40 Per Cent Level

BOSTON, Jan. 3.—Pig iron sales in New England dropped off materially during the last week in 1927. The Mystic Iron Works and the Champlain stack again led in bookings, but the combined sales of both furnaces approximated only 1000 tons. The largest individual transaction reported was a sale of 400 tons No. 2X to a Massachusetts foundry at a price equivalent to about $16.50 at Buffalo. A Buffalo stack, which heretofore has quoted as low as $16 base, is now asking $16.50 a ton for No. 2 plain and No. 2X. Other Buffalo furnaces are holding to a $17 base both with and without differentials. There are no open inquiries of any size in the market, and indications are that all of the large melters have enough iron in stock or on order to last through the first quarter. One of the largest has enough iron to last six months. It is conservatively estimated that the New England foundry industry operated at 40 per cent of capacity during December.

Prices of foundry iron per gross ton, delivered to most New England points:

Buffalo, sil. 1.75 to 2.25	$20.91 to	$21.91
Buffalo, sil. 2.25 to 2.75	21.41 to	22.41
East. Penn., sil. 1.75 to 2.25	22.65 to	23.15
East. Penn., sil. 2.25 to 2.75	23.15 to	23.65
Virginia, sil. 1.75 to 2.25		25.71
Virginia, sil. 2.25 to 2.75		26.21
Alabama, sil. 1.75 to 2.25	22.91 to	24.77
Alabama, sil. 2.25 to 2.75	23.41 to	25.27

Freight rates: $4.91 from Buffalo, $3.65 from eastern Pennsylvania, $5.21 all rail from Virginia, $6.91 to $8.77 from Alabama.

Cast Iron Pipe.—A contract for a sewage disposal plant for East Providence, R. I., has been let to J. H. Ferguson Co., Providence, which has placed approximately 500 tons of pipe and fittings, required in the project, with the Warren Foundry & Pipe Co. Westfield, Mass., has placed 100 tons of 6-in. pipe with the same foundry. R. D. Wood & Co. were awarded 400 tons 4, 6, 8 and 12-in. Class B pipe for Worcester, Mass., at $41.30 a ton, delivered. The Warren Foundry & Pipe Co. was second low bidder at $41.70. Southern foundries are less active in soliciting business in New England. Boston has yet to place some 2000 tons of pipe and fittings. Through a typographical error, the quotations of B. Nicoll & Co. on this tonnage were reported last week at $29.25 for the 8-in. and 10-in. instead of $39.25 per ton. Most Northern pipe foundries are well booked for the first quarter. Private business continues good at $46.10 to $47.10 a ton, delivered common Boston freight rate point, for 4-in. pipe, and at $41.10 to $42.10 for 6 to 16-in., which compare with $60.10 for 4-in. and $56.10 for 6 to 16-in. a year ago.

Shapes and Plates.—Fabricators report a marked falling off in new prospects. Current bookings are light. The proposed dry goods store and office building in the Park Square district, Boston, calling for 14,000 tons of structural steel, is the largest job of its kind on record in New England. It is believed that few New England plants are equipped to handle this tonnage, and that competition from outside fabricators will be keen. The market for standard shapes and plates is firm at 1.80c. per lb., base Pittsburgh.

Bars.—It now develops that local mill representatives have booked sizable tonnages of bars for first quarter delivery. Most of these orders were taken at prices prevailing before the recent advance, but business was taken at 1.80c. per lb., base Pittsburgh. The market for reinforcing steel bars is much firmer. The commonly quoted out-of-stock price of 2.70c. per lb., base, is steadier than for several months.

Cold-Rolled Strip Steel.—Current bookings are small, and prices remain unchanged.

Mill Prices on Cold-Rolled Strip in North Atlantic States: In 1 to 3-ton lots, 3.25c. per lb., base Pittsburgh, and also, 3.25c. to 3.40c. per lb., base Worcester, Mass.

Coke.—Neither the New England Coal & Coke Co. nor the Providence Gas Co. made any change Jan. 2 in its price on by-product foundry coke. The market remains at $11.50 a ton, delivered within a $3.10 freight rate zone, which compares with $12 a month ago, and $13 a year ago. The New England Coal & Coke Co. is asking $8.50 a ton at ovens for domestic coke, the same price as a month ago. Shipments of foundry fuel in the last week of 1927 were light.

Old Material.—Little old material is offered for sale in New England, as holders of scrap look for higher prices. A small tonnage of No. 1 heavy melting steel was sold during the past week at $9 to $9.50 a ton on cars, shipping point, or $3 a ton under prices of a year ago.

Buying prices per gross ton f.o.b. Boston rate shipping points:

No. 1 heavy melting steel	$9.00 to	$9.25
Scrap rails	8.75 to	9.00
No. 1 railroad wrought	10.00 to	10.50
No. 1 yard wrought	8.50 to	9.00
Machine shop turnings	6.00 to	6.25
Cast iron borings (steel works and rolling mill)	6.00 to	6.25
Bundled skeleton, long	5.60 to	6.00
Forge flashings	6.00 to	6.50
Blast furnace borings and turnings	6.00 to	6.25
Forge scrap	6.00 to	6.50
Shafting	13.00 to	13.50
Street car axles	16.00 to	17.00
Wrought pipe (1 in. in diameter, over 2 ft. long)	7.50 to	8.00
Rails for rerolling	10.00 to	10.50
Cast iron borings, chemical	9.50 to	10.00

Prices per gross ton delivered consumers' yards:

Textile cast	$14.50 to	$15.50
No. 1 machinery cast	14.50 to	15.00
No. 2 machinery cast	12.50 to	13.00
Stove plate	11.00 to	11.50
Railroad malleable	13.50 to	14.00

St. Louis

Pig Iron Sales Total 20,000 Tons—Rise in Scrap Continues

ST. LOUIS, Jan. 3.—The Granite City maker reports an unusually large tonnage of pig iron placed during the week—20,000 tons, including 10,000 tons sold to a steel plant in this district. The remainder consisted of orders from malleable plants, radiator manufacturers, specialty makers and jobbing foundries. Melters continue to show keen interest in the market, and the prospects are that considerable business will be placed after the first of the year. Prices are unchanged.

Prices per gross ton at St. Louis:

No. 2 fdy., sil. 1.75 to 2.25 f.o.b. Granite City, Ill.	$19.50 to $20.00
Northern No. 2 fdy., delivered St. Louis	20.66
Southern No. 2 fdy., delivered	20.42
Northern malleable, delivered	20.66
Northern basic, delivered	20.66

Freight rates: 81c. from Granite City to St. Louis; $2.16 from Chicago; $4.42 from Birmingham.

Coke.—Cold weather tends to sustain the volume of sales of domestic grades, while buying of foundry coke is rather slow.

Finished Steel.—The usual holiday lull prevails in these lines. Some specifications against contracts were received during the week, but very little new business was placed. The placing of railroad car orders in this district is expected to stimulate steel demand considerably. Warehouse business is quiet. Fabricators of structural steel are booking only a few small orders. The reinforcing bar market is quiet.

Old Material.—Scrap continues to advance. Dealers are paying higher prices and are laying down material in anticipation of a better market after the first of the year. With the placing of some railroad car orders and with others in prospect, dealers believe that consuming plants will buy soon and at higher prices. There was some buying of specialties during the week, and rolling mill grades continue in good demand. Heavy melting steel, heavy shoveling steel, No. 2 railroad wrought and miscellaneous rails are 25c. a ton higher. Machine shop turnings, steel car axles, wrought iron bars and transoms, short rails, No. 1 machinery cast and No. 1 railroad cast have advanced 50c. Unusually high prices were paid for a Missouri Pacific list of 6000 tons, and it is reported that the material was bought by a Kansas City consumer.

Prices per gross ton f.o.b. dealers' yards and delivered St. Louis district consumers' works:

Heavy melting steel	$12.25 to $12.75
No. 1 locomotive tires	14.00 to 14.25
Heavy shoveling steel	12.25 to 12.75
Miscellaneous standard-section rails, including frogs, switches and guards, cut apart	14.25 to 14.75
Railroad springs	15.00 to 15.50
Bundled sheets	9.00 to 9.50
No. 2 railroad wrought	12.25 to 12.75
No. 1 busheling	10.50 to 11.00
Cast iron borings	9.50 to 10.00
Iron rails	13.50 to 14.00
Rails for rolling	15.50 to 16.00
Machine shop turnings	7.50 to 8.00
Steel car axles	20.00 to 20.50
Iron car axles	24.00 to 24.50
Wrought iron bars and transoms	21.00 to 21.50
No. 1 railroad wrought	11.50 to 12.00
Steel rails, less than 3 ft.	16.00 to 16.50
Steel angle bars	13.00 to 13.50
Cast iron carwheels	14.00 to 14.50
No. 1 machinery cast	15.75 to 16.25
Railroad malleable	12.25 to 12.75
No. 1 railroad cast	14.00 to 14.50
Agricultural malleable	11.50 to 12.00
Relaying rails, 60 lb. and under	20.50 to 23.50
Relaying rails, 70 lb. and over	26.50 to 29.00

Warehouse Prices, f.o.b. San Francisco

	Base per Lb.
Plates and structural shapes	3.15c.
Soft steel bars	3.15c.

Common wire nails, base per keg	$3.35
Cement coated nails, 100-lb. keg	3.35

San Francisco

Prices on Foreign Pig Iron and Coke Reduced

SAN FRANCISCO, Jan. 3.—Little business in iron and steel was transacted during the week, owing to the holidays and the approaching inventory period. Structural shapes and cast iron pipe were the most active products.

A shipment of 550 tons Indian iron arrived on the Coast this week and was divided between Los Angeles and San Francisco. Foreign shipments are increasing, and Indian iron is down $1 a ton, now being quoted at $24 to $25, duty paid.

Prices per gross ton at San Francisco:

*Utah basic	$25.00 to $26.00
*Utah foundry, sil. 2.75 to 3.25	25.00 to 26.00
**Indian foundry, sil. 2.75 to 3.25	24.00 to 25.00
**German foundry, sil. 2.75 to 3.25	24.25

*Delivered San Francisco.
**Duty paid, f.o.b. cars San Francisco.

Four thousand tons of English coke is scheduled to arrive in the middle of January, and prices on beehive are now $15 to $16, and on by-product, $12 to $13 per net ton at incoming dock.

Los Angeles placed 771 tons each of cast iron pipe with the American and Pacific States cast iron pipe companies. The Grinnell Co. was low on 350 tons of 20-in. Class B for Pasadena, Cal. Santa Clara, Cal., takes bids Jan. 9 for 1510 tons of 4 to 14-in. Class B.

The Grinnell Co. secured 625 tons of 8-in. seamless pipe for Los Angeles.

Prices remain unchanged except on iron and coke.

Buffalo

Fair Demand for Pig Iron—Leading Steel Plant Curtails Output

BUFFALO, Jan. 3.—The pig iron market remains fairly active. Several lots of 500 to 1000 tons of foundry and malleable have been placed, and new inquiries for like amounts are now before the market. A base price of $17, furnace, is being maintained on business taken in the Buffalo district, but this figure continues to be shaded in New England. It is believed that considerable first quarter contracting is still to be done.

Prices per gross ton, f.o.b. furnace:

No. 2 plain fdy., sil. 1.75 to 2.25	$17.00
No. 2X foundry, sil. 2.25 to 2.75	17.50
No. 1X foundry, sil. 2.75 to 3.25	18.50
Malleable, sil. up to 2.25	17.50
Basic	17.00
Lake Superior charcoal	27.28

Finished Steel.—One of the principal steel producers now has only three open-hearth furnaces active. The other mills continue to maintain their operations, which average about 75 per cent. Inquiry is fair for bars, shapes and plates, and sheet buying has been in good volume. Bids are in for the Hecker-Jones-Jewell Co. flour mill and elevator, Buffalo, which will require 1500 tons of reinforcing bars. Other pending business in concrete bars is limited to small lots.

Old Material.—The market has been lacking in outstanding transactions, and prices remain unchanged. One of the mills continues to restrict shipments, and another, while continuing to accept shipments on old orders, has done no new buying. Reduced open-hearth

Warehouse Prices, f.o.b. Buffalo

	Base per Lb.

New York

Steel Prices Steady as New Year Opens—Merchant Stack to Go In

NEW YORK, Jan. 3.—Despite the holiday season, the last week of 1927 brought out a fair volume of pig iron buying. Sales by local brokers exceeded 5000 tons, and this total was made up mainly of small lots. In some instances pressure for deliveries indicates that melters have low stocks. Aside from spot demands, it is thought unlikely that there will be extensive buying for this quarter until foundries have completed the taking of inventories. There is only one important first quarter inquiry before the trade. This is from the Worthington Pump & Machinery Corporation, New York, and calls for between 1200 and 1300 tons. Of this amount 350 tons of No. 2 plain and 40 tons of high manganese pig iron are wanted for Holyoke, Mass., 500 to 600 tons of various foundry grades is for Buffalo, and 150 tons of No. 2 plain, 100 tons of No. 1 and 50 tons of Bessemer ferrosilicon are for Elmwood Place, Cincinnati. The No. 2 furnace of Witherbee, Sherman & Co. at Port Henry, N. Y., will be blown in Jan. 4 or 5. The price situation is substantially unchanged.

Prices per gross ton, delivered New York district:

Buffalo No. 2 fdy., sil. 1.75 to 2.25	$21.41 to $21.91
East. Pa. No. 2 fdy., sil. 1.75 to 2.25	19.89 to 21.52
East. Pa. No. 2 fdy., sil. 2.25 to 2.75	20.39 to 22.02
East. Pa. No. 1X fdy., sil. 2.75 to 3.25	20.89 to 22.52

Freight rates: $4.91 from Buffalo, $1.39 to $2.52 from eastern Pennsylvania.

Finished Steel.—The last week of the old year brought no change in the steel situation beyond the continued accumulation of tonnage specified against expiring fourth quarter contracts. The orders booked by many of the local sales offices were considerably in excess of those received in November, and mills have a larger backlog of orders for the beginning of January than they had at the beginning of December. A number of instances are cited to illustrate the firmness with which the steel companies are holding prices on plates, shapes and bars. While structural shapes on the Bethlehem basis are 2.09½c., delivered New York, efforts to purchase plates and bars along with shapes at the same price are declared to have been fruitless. Contracts have been made with some of the largest buyers at 2.09½c. on shapes, 2.12½c. on plates and 2.14c. on bars, delivered New York. Specifications on fourth quarter sheet contracts were heavier in the last two weeks of December than in the first half of the month, with the result that some consumers and jobbers will be taking deliveries on these specifications throughout January. Hot and cold-rolled strip prices remain unchanged, and other products are steadier than at any time in recent months. All in all, the steel trade enters the new year with the price situation more firmly in hand than at any time during the latter half of 1927.

Mill prices per lb., delivered New York: Soft steel bars, 2.14c.; plates, 2.12½c.; structural shapes, 2.09½c.; bar iron, 2.14c.

Reinforcing Bars.—Awards of 3000 tons of bars for the United States Appraisers' Stores, New York, to the Jones & Laughlin Steel Corporation, and of 800 tons for roadway decks on the second of the Staten Island-New Jersey bridges to E. T. Edwards, Columbia, Pa., were the outstanding transactions in this

*No. 28 and lighter, 36 in. wide, 20c. higher per 100 lb.

market during the last week of the year. These were the last of the outstanding jobs pending, and the new year finds a comparatively small tonnage involved in inquiries. Business has been unusually quiet in the last few days. Distributers have advanced the mill price $1 a ton and are now quoting 1.90c., Pittsburgh. The Youngstown warehouse price is unchanged at 2.20c., or 2.57½c., on cars at New York, and New York warehouses are quoting 2.80c. per lb. for lots of 5 tons or more, delivered at job; 2.95c. for lots of 2 to 5 tons, and 3.24c. for less than 2 tons.

Cast Iron Pipe.—No purchases of consequence were reported in the past week, but with the holidays over a resumption of private buying and some municipal inquiry is expected. There is some export inquiry in the market, including two medium-sized tonnages of water pipe for Cuban projects. The price situation is unchanged, although most makers are fairly well booked and are able to take a more independent position.

Prices per net ton, delivered New York: Water pipe 6-in. and larger, $37.25 to $38.25; 4-in. and 5-in., $42.25 to $43.25; 3-in., $52.25 to $53.25; Class A and gas pipe, $4 to $5 extra.

Fluorspar.—An Ohio consumer during the week purchased 5000 tons of domestic gravel fluorspar for delivery through 1928 and another purchased 500 tons for six months. Prices are weak and unsettled, as is indicated by these sales, which were made at sharp concessions and indicate that the market is not above $15 per ton at mines for good lots, or $1 a ton below recent quotations.

Coke.—Most consumers are fairly well covered for the present, and current purchasing is light. Standard foundry coke is still quoted at $4 per net ton, Connellsville, for prompt shipment, and on a sizable tonnage slightly less might be obtained. Furnace coke ranges from $2.75 to $3, Connellsville. Delivered prices on Connellsville foundry coke are: To northern New Jersey, $8.03; to New York or Brooklyn, $8.79; to Newark or Jersey City, N. J., $7.91. Reports continue that by-product foundry coke prices have been shaded in a few cases, but this cannot be confirmed. Quotations on by-product foundry coke are $9.45 to $9.85 per net ton, delivered Newark or Jersey City.

Warehouse Business.—Despite the holidays, purchasing in the final week of December compared favorably with the rest of the month. Orders were for small tonnages, but total bookings were of fair size.

Old Material.—Although buying prices are substantially unchanged, the market is fairly firm, and in some instances brokers are paying slightly higher prices than a week ago. Stove plate is quoted at $12.25 per ton, delivered Phoenixville, and at $12.50 per ton, delivered Harrisburg, Pa. No. 1 heavy melting steel is unchanged at $13.50 per ton, delivered to consumers at Bethlehem, Conshohocken and Coatesville, Pa., and Claymont, Del. Yard grade is being purchased at $10.50 to $11 per ton, delivered to mills at Phoenixville and Harrisburg. On recent sales of steel axles for shipment to Milton and Columbia, Pa., $21.25 per ton, delivered, is being offered by brokers. Mixed borings and turnings continue unchanged at $10 per ton, delivered to Bethlehem and Swedeland, Pa.

Dealers' buying prices per gross ton, New York:

No. 1 heavy melting steel	$10.00 to $10.85
Heavy melting steel (yard)	6.25 to 7.25
No. 1 heavy breakable cast	11.25 to 12.00
Stove plate (steel works)	8.25 to 8.75
Locomotive grate bars	8.25 to 8.50
Machine shop turnings	6.50 to 7.50
Short shoveling turnings	6.50 to 7.50
Cast borings (blast furnace or steel works)	6.75 to 7.25
Mixed borings and turnings	6.50 to 7.50
Steel car axles	17.00 to 17.50
Iron car axles	23.75 to 24.75
Iron and steel pipe (1 in. diam., not under 2 ft. long)	8.75 to 9.25
Forge fire	6.50 to 7.00
No. 1 railroad wrought	10.50 to 11.00
No. 1 yard wrought, long	9.00 to 9.50
Rails for rolling	10.50 to 11.00
Cast iron carwheels	11.25 to 11.75
Stove plate (foundry)	8.75 to 9.25
Malleable cast (railroad)	10.00 to 10.50
Cast borings (chemical)	11.00 to 12.00

Prices per gross ton, delivered local foundries:

No. 1 machinery cast	$13.50 to $14.00
No. 1 heavy cast (columns, building materials, etc.), cupola size	11.50 to 12.00
No. 2 cast (radiators, cast boilers, etc.)	11.00 to 11.50

Cleveland

Mills Have Good Backlogs—Sustained Demand for Pig Iron

CLEVELAND, Jan. 3.—The new year starts with better operations for some of the mills and prospects for fairly good business through the first quarter. Better operations in the automobile industry are counted on to stimulate the demand for steel. Specifications against expiring contracts for steel bars, plates and structural material were heavy in the past week, and several mills are comfortably filled for a month or longer. Some of the sheet mills have enough orders to keep them running nearly at capacity through January. Mills set Dec. 31 as the deadline for accepting specifications against contracts for steel bars, plates and structural shapes taken at $1 a ton lower than the present market. While there were some cancellations, many consumers ordered about all the steel they had contracted for. Some additional commitments for first quarter were made during the week at the present prices, and most consumers are now under contract.

Mills have received good specifications in the past few days from the automotive industry for sheets and strip steel for January requirements. These indicate an increase in motor car production schedules this month. Very little new business is coming from this source, as most of the automobile companies are well covered with contracts.

In the structural field, inquiry is light and prices on fabricating material are weak. Locomotive orders have stimulated the demand for plates. A Cleveland mill sold 700 tons to a locomotive builder during the week. Steel bars, plates and structural material are firm at 1.80c., Pittsburgh. The ruling Cleveland price on steel bars is 1.80c., mill, although this is being shaded $1 a ton.

Pig Iron.—Sales of foundry and malleable iron have continued quite heavy in the past week, in spite of the holiday season. The greater part of the business came from the automotive industry. Few contracts for delivery beyond the first quarter have been taken, due partly to the fact that producers have not been inclined to sell for the entire first half. However, the size of many of the orders indicate that some foundries are buying enough iron to carry them well into the second quarter. Furnaces are getting a good volume of specifications for January shipment. While the market has a firmer tone than recently, a price of $16.50, furnace, on foundry and malleable iron has not disappeared for shipment to competitive points. At least one Lake producer, however, is now quoting $17, furnace, as its minimum price. In Michigan the market still ranges from $17.50 to $18, furnace. Demand for low phosphorus iron has quieted down after a fair buying movement, and the Valley price has settled down to $26.50, furnace, for most business.

Prices per gross ton at Cleveland:

N'th'n No. 2 fdy., sil. 1.75 to 2.25	$18.50
Southern fdy., sil. 1.75 to 2.25	22.00
Malleable	18.50
Ohio silvery, 8 per cent	28.00
Basic, Valley furnace	17.00
Standard low phos., Valley furnace	$26.50 to 27.00

Prices, except on basic and low phosphorus, are delivered Cleveland. Freight rates: 50c. from local furnaces; $3 from Jackson, Ohio; $6 from Birmingham.

Galvanized sheets (No. 24)	4.40c. to 4.50c.
Blue annealed sheets (No. 10)	3.25c.
No. 9 annealed wire, per 100 lb.	$2.90
No. 9 galvanized wire, per 100 lb.	3.35
Common wire nails, base per keg	2.90

*Net base, including boxing and cutting to length.

CARNEGIE LIBRARY OF ATLANTA

Semi-Finished Steel.—Last quarter prices will probably prevail through the present quarter on sheet bars, billets and slabs, as specifications have been taken for January shipment at those prices. Following the advance in the Pittsburgh district, a local producer has advanced wire rods to $42, Cleveland. Some first quarter contracts were taken at $40 before the advance.

Sheets.—Mills received good specifications in the past week against orders placed when lower prices were ruling, but little new business came out. The market shows a firmer tone, although prices have not yet got up to the bases adopted by most producers for the first quarter. Black sheets are still available at 2.80c., Pittsburgh. Blue annealed sheets now appear to be holding at a minimum of 2.05c., or a $1 a ton advance, and most mills are holding to 2.10c. On galvanized sheets 3.65c., Pittsburgh, instead of 3.65c., Ohio mill, has become the ruling quotation.

Strip Steel.—Mills have taken considerable business in specifications against hot-rolled strip contracts, but new business is very light. Prices are still weak. Ruling quotations are 1.80c., Pittsburgh, for 6 to 12-in. strip and 2c. for narrower than 6 in. Cold-rolled strip is steady at 2.75c., Cleveland, for 3 tons and over.

Bolts, Nuts and Rivets.—Specifications for bolts and nuts are still light. Orders for rivets from locomotive builders show a slight pick-up. Rivet manufacturers have covered practically all buyers with contracts at $2.75 per 100 lb. for large rivets, and apparently have abandoned the plan of charging those who do not place contracts $5 a ton more.

Reinforcing Bars.—Three new inquiries came out during the week for work aggregating 1300 tons. Rail steel bars are unchanged at 1.65c. to 1.70c., mill.

Old Material.—Efforts of dealers to advance prices have met with success to some extent, as steel-making scrap seems to be no longer available below $13.75 for No. 1 grade. This price represents an advance of 25c. a ton. Dealers are also trying to get a little more money for blast furnace scrap, although locally this material is a drug on the market. Some fair-sized lots of scrap were sold by Detroit automobile manufacturers in the past week, and they are reported to have brought somewhat higher prices than recently prevailed.

Prices per gross ton, delivered consumers' yards:

Basic Open-Hearth Grades	
No. 1 heavy melting steel	$13.75 to $14.00
No. 2 heavy melting steel	13.25 to 13.50
Compressed sheet steel	12.75 to 13.00
Light bundled sheet stampings	11.50 to 11.75
Drop forge flashings	12.50 to 13.00
Machine shop turnings	9.00 to 9.25
No. 1 railroad wrought	11.50 to 12.00
No. 2 railroad wrought	13.50 to 14.00
No. 1 busheling	11.50 to 12.00
Pipes and flues	9.00 to 9.50
Steel axle turnings	12.50 to 13.00
Acid Open-Hearth Grades	
Low phosphorus forging crops	16.50 to 17.00
Low phosphorus, billet, bloom and slab crops	17.00 to 17.50
Low phosphorus sheet bar crops	16.50 to 17.00
Low phosphorus plate scrap	16.00 to 16.50
Blast Furnace Grades	
Cast iron borings	10.25 to 10.75
Mixed borings and short turnings	10.25 to 10.75
No. 2 busheling	10.25 to 10.75
Cupola Grades	
No. 1 cast	16.00 to 16.50
Railroad grate bars	11.00 to 12.00
Stove plate	12.00 to 12.50
Rails under 3 ft	18.00 to 18.50
Miscellaneous	
Railroad malleable	15.00 to 15.50
Rails for rolling	16.25 to 16.50

Three Gear Companies and One Drop Forger to Merge

Plans for the merger of three leading gear manufacturers—the Van Dorn & Dutton Co., Cleveland; the Fawcus Machine Co., Pittsburgh, and the William Ganschow Co., Chicago—and the Ohio Forge Co., Cleveland, maker of drop forgings, are under way. The consummation of the consolidation is expected to be announced this week. A new company, Gears & Forgings, Inc., will acquire the plants and other assets, of the four companies of which the combined resources will exceed $6,000,000. F. W. Sinram, president Van Dorn & Dutton Co., is slated for the presidency of the new company.

Canada

Heavier Contracting for Pig Iron —Scrap Market Softer

TORONTO, ONT., Jan. 3.—Advance buying has been the feature of the Canadian pig iron market during the past few days. Melters are showing more interest in first quarter needs, and contracts now being placed run into large tonnages. However, there are still a large number of Canadian consumers who have not taken action on their first quarter needs. There is nothing in the price situation that leads consumers to look for an early advance.

Old Material.—Some improvement in sales is reported by local dealers, but new business is chiefly in connection with the placing of first quarter contracts, although the large majority of consumers have yet to make known their needs for the next three months. Prices are by no means on a firm footing.

Dealers' buying prices:

	Toronto	Montreal
Per Gross Ton		
Heavy melting steel	$9.00	$8.00
Rails, scrap	10.00	10.00
No. 1 wrought	9.00	11.00
Machine shop turnings	7.00	6.00
Boiler plate	7.00	7.00
Heavy axle turnings	7.50	7.50
Cast borings	7.50	6.00
Steel turnings	7.00	6.50
Wrought pipe	5.00	6.00
Steel axles	14.00	19.00
Axles, wrought iron	16.00	21.00
No. 1 machinery cast	....	16.00
Stove plate	....	12.00
Standard carwheels	....	14.50
Malleable	....	13.00
Per Net Ton		
No. 1 machinery cast	15.00	....
Stove plate	9.00	....
Standard carwheels	13.00	....
Malleable scrap	13.00	....

Merger of Youngstown and Inland Companies Being Negotiated

YOUNGSTOWN, Jan. 3.—In an announcement tonight regarding the proposed purchase of the Inland Steel Co., Chicago, by the Youngstown Sheet & Tube Co., President James A. Campbell of the latter company, said:

"We have opened negotiations for a union of the two plants and would be pleased if they could be carried through successfully. There is an economic advantage in putting the two companies together. Their plants lie side by side and could be operated with much less expense if they were under one management. This could be done now, since we are not in competition. It might not be possible later, if we were to enter into different lines of manufacture. We are not buying up Inland stock. We cannot do that and will not."

Weirton Steel Co. Acquires License Under Armco Patents

A statement has been given to the press in the past week to the effect that the Weirton Steel Co., which was one of the two pioneer steel companies in designing and building a modern mill for the production of wide, light sheets by continuous rolling, has taken out a license to use all the patents owned and controlled by the American Rolling Mill Co., for the continuous rolling of steel strips and sheets. The system designed by the Weirton Steel Co. was different in some respects from that in use at the American Rolling Mill Co.'s plant at Ashland, Ky., but it is stated that the taking out of the license by the Weirton company, which is the first steel company to enter into such a contract, is "to obviate patent conflict and to permit orderly development of the new and economical process."

NON-FERROUS METAL MARKETS

The Week's Prices

Cents per Pound for Early Delivery

	Jan. 3	Dec. 30	Dec. 29	Dec. 28
Lake copper, N. Y.	14.25	14.25	14.25	14.25
Electrolytic copper, N. Y.*	13.75	13.75	13.75	13.75
Straits tin, spot, N. Y.	57.75	57.87½	57.87½	57.75
Lead, New York	6.50	6.50	6.50	6.50
Lead, St. Louis	6.30	6.30	6.30	6.30
Zinc, New York	6.00	6.00	6.00	6.00
Zinc, St. Louis	5.65	5.65	5.65	5.65

*Refinery quotation; delivered price ¼c. higher.

NEW YORK, Jan. 3.—All the markets are firm as the year opens. There is, however, very little activity thus far. The copper market is quiet, but decidedly steady. Buying of tin has been moderate at slightly lower levels. Lead is unchanged and firm. The zinc market is getting stronger.

Copper.—As the year opens prices seem to be growing firmer. Nearly all the metal which was available a few days ago at 14c., delivered, is reported to be about all cleaned up and the market is almost entirely on a basis of 14.12½c., delivered in the Connecticut Valley, for electrolytic copper. There is still a little available at the lower price and the market is quoted nominally at 14c. to 14.12½c., delivered. Domestic demand has been and is still very light, which is natural at this season, and there has hardly been buying enough to test the market. There has been a fair amount of business done for export at 13.50c., c.i.f., usual European ports, which continues to be the official quotation of Copper Exporters, Inc. The market as a whole having passed through the holiday season practically without weakening is pointed to as indicative of fundamental strength.

Copper Averages.—The average price of Lake copper for the month of December, based on daily quotations in THE IRON AGE, was 14.20c., delivered. The average price of electrolytic copper was 13.78½c., refinery, or 14.035c., delivered.

Tin.—The holiday week has been a quiet one, as expected. Sales for the last week of the year ended Friday, Dec. 30, were about 700 tons, with 400 tons of this done on Thursday, Dec. 29. On that day consumers were active buyers. Today, the first active business day of the new year, the market has been exceedingly dull, with spot Straits tin quoted at 57.75c., New York. London prices today were a little lower than two weeks ago, with spot standard quoted at £263 10s., future standard at £261 5s., and spot Straits at £263 10s. The Singapore market today was £265 10s. The feature of the market in general is that some consumers are advancing their contracts for February to prompt shipment. They are, however, not buying any more metal, which may mean less demand for prompt and nearby delivery. December deliveries into consumption are reported as 4535 tons, the smallest in a long time. The quantity in stock and landing on Dec. 1 was 1573 tons. Preliminary calculations of the total visible supply indicate an increase of from 642 tons to 1139 tons for December, depending on the calculator. The figures of the London and New York exchanges place the increase at 1139 tons for December, bringing the total to 15,733 tons.

Lead.—The market is quiet and practically unchanged except possibly a little firmer in the West. Demand is light. The quotation of the leading producer is unchanged at 6.50c., New York, as the contract price, with the St. Louis range at 6.30c. to 6.35c.

Zinc.—A fair amount of inquiry is reported for the first business day of the new year. Evidently producers are assuming a firmer attitude as to prices. It is difficult now to purchase any prime Western zinc at less than 5.65c., St. Louis, with some sellers asking a little more.

Nickel.—A reduction in the price of electrolytic nickel is announced by the International Nickel Co. from 39c. to 37c. per lb. in wholesale lots. Quotations for ingot and shot nickel remain unchanged at 35c. and 36c. respectively.

Non-Ferrous Metals at Chicago

CHICAGO, Jan. 3.—A fair amount of forward business is being taken and prices are steady except in tin and antimony. The old metal market is quiet and without feature.

Prices, per lb., in carload lots: Lake copper, 14.25c.; tin, 59c.; lead, 6.40c.; zinc, 5.75c.; in less-than-carload lots, antimony, 12c. On old metals we quote copper wire, crucible shapes and copper clips, 10c.; copper bottoms, 9c.; red brass, 9c.; yellow brass, 6.75c.; lead pipe, 5c.; zinc, 3.50c.; pewter, No. 1, 34c.; tin foil, 43.50c.; block tin, 52c.; aluminum, 12.50c.; all being dealers' prices for less-than-carload lots.

Metals from New York Warehouse

Delivered Prices Per Lb.

Tin, Straits pig	58.50c. to 59.50c.
Tin, bar	60.50c. to 61.50c.
Copper, Lake	15.25c.
Copper, electrolytic	15.00c.
Copper, casting	14.25c.
Zinc, slab	7.75c. to 8.75c.
Lead, American pig	7.65c. to 8.65c.
Lead, bar	9.90c. to 10.90c.
Antimony, Asiatic	13.00c. to 13.50c.
Aluminum No. 1 ingot for remelting (guaranteed over 99 per cent pure)	27.00c. to 28.00c.
Aluminum ingots, No. 12 alloy	26.00c. to 27.00c.
Babbitt metal, commercial grade	30.00c. to 40.00c.
Solder, ½ and ½	39.25c. to 40.25c.

Metals from Cleveland Warehouse

Delivered Prices Per Lb.

Tin, Straits pig	63.75c.
Tin, bar	64.75c.
Copper, Lake	15.25c.
Copper, electrolytic	15.25c.
Copper, casting	14.50c.
Zinc, slab	7.75c.
Lead, American pig	7.25c.
Antimony, Asiatic	16.00c.
Lead, bar	9.50c.
Babbitt metal, medium grade	19.75c.
Babbitt metal, high grade	67.75c.
Solder, ½ and ½	37.75c.

Non-Ferrous Rolled Products

Mill prices on bronze, brass and copper products are holding at the advances of Dec. 5. There has been no revision in the quotations on zinc sheets and lead full sheets since Aug. 5 and Dec. 1 respectively.

List Prices, Per Lb., f.o.b. Mill

On Copper and Brass Products, Freight up to 75c. per 100 Lb. Allowed on Shipments of 500 Lb. or Over

Sheets—	
High brass	18.75c.
Copper, hot rolled	22.75c.
Zinc	10.00c.
Lead (full sheets)	10.00c. to 10.25c.
Seamless Tubes—	
High brass	23.62½c.
Copper	24.50c.
Rods—	
High brass	16.50c.
Naval brass	19.25c.
Wire—	
Copper	15.75c.
High brass	19.25c.
Copper in Rolls	21.75c.
Brazed Brass Tubing	26.75c.

Aluminum Products in Ton Lots

The carload freight rate is allowed to destinations east of Mississippi River and also allowed to St. Louis on shipments to destinations west of that river.

Sheets, 0 to 10 gage, 3 to 30 in. wide	33.00c.
Tubes, base	42.00c.
Machine rods	34.00c.

Improvement in Steel Business Is Forecast for 1928

(*Concluded from page* 13)

industries declined irregularly throughout the year, notably in the case of railroads, automobile manufacturing, mining and oil-well drilling. The recovery in building and agriculture in the latter part of the year tended to check the decline. One of the strongest features of the steel situation is that production has been fairly well adjusted to the potential requirements of the country, except from April through July, and was relatively low toward the end of the year. This gives reason to believe that stocks of steel are small and that the industry is in a position to respond quickly to the anticipated general business improvement.

The average price of finished steel in 1927 was not so steady as in the preceding year and at the end was about 5 per cent under the average for January (see Fig. 4). There were downward readjustments at the beginning of the year and again in the fall. Clear signs of improvement in prices appeared toward the end of the year, due to curtailed production and a little better sales volume. The notable changes during the year were the generally sagging trend of the markets for bars and nails, and the sharp reductions in sheets during January and February, and again in October and November. These conditions reflected the decline in residential building and in automobile production.

Better Business Anticipated for 1928

THAT a moderate recovery will develop early in the year, and gain considerable momentum before the end of the first half, is the general hypothesis which seems to furnish the most plausible working basis for anticipating the business trend in 1928. There is at present nothing to indicate that business will not be good thereafter, but this cannot be forecast with certainty. The recovery in business will probably lead to a tightening in bank credit and to higher money rates.

It is difficult, if not impossible, to anticipate when these developments will occur. If business recovery brings an increase in commercial loans by spring, and gold exports continue during the next two or three months, money rates may be expected to advance and bring a recession in security markets before the end of the first quarter. This, however, need not be followed by a slump in business any more than it was in February, 1926.

Commodity prices are not likely to show a sharp advance nor a large decline. On the one hand, the practical completion of deflation in foreign currencies, and curtailed domestic production together with higher farm prices, will make for firmness. But, on the other hand, gold exports and the probable curtailment of bank credit, together with a large productive capacity and active competition at home and abroad, will tend to depress prices. Little more than a guess seems possible, but such a guess would be that commodity prices will advance somewhat in the early part of 1928, then recede a little, and then show irregular recovery. It does not seem that business will have to contend with a steadily declining price level, as was the case during 1926 and a good part of 1927. (See Fig. 5.)

Improvement in Steel Seems Certain

AS to the steel industry, recovery seems practically certain during the first half of the year and possibly thereafter. The expansion in the automobile industry, which is in sight, together with sustained activity in building and a general improvement in business, seem to make this as nearly certain as such things can be. Moreover, it is a reasonable probability that the oil industry has seen its worst days and will show improvement during 1928.

In the same way, railroad equipment buying will almost certainly be better next year than it has been during most of 1927. At present the rather large surplus of freight cars and locomotives held by the carriers and a low percentage of bad-order equipment seem to make any early sustained buying movement improbable. But the longer the period which elapses without replacements, the more necessary will the buying be when railroad freight traffic begins to reflect the probable expansion in general business.

I will only add that both my P-V line and the unfilled steel orders barometer, which are regular features of this department of THE IRON AGE, agree in forecasting early improvement for general business and for the iron and steel industry.

Many Factors Participated in Development of Continuous Sheet

(*Concluded from page* 77)

are (a) better constructed motors and (b) finer pieces of mechanism, both in the drives and in the mills themselves. The multiple roll backed-up mill requires machinery of a quality not at all comparable with the old-fashioned mills. In turn a higher grade of skilled mechanic is required to take care of it. He has had to throw his sledge hammer away and replace it with a micrometer and a set of feelers. The machinery manufacturers should receive much credit for their assistance in this development.

Studies in Finishing Departments

Just how far the development will carry is hard to predict, but it seems well within the bounds of possibility that the rolling of tin plate and the processing of both tin plate and high finished sheets will be affected profoundly. Concurrently with the development of the rolling mills themselves, the processing, pickling, annealing and cold rolling processes have been the subject of study, analysis and invention. As in the rolling mills, continuous operation of a sequence of processes is the achievement to be desired, simultaneously effecting an equally great reduction of labor and improvement in quality, due to scientific control.

Most of the inventions and discoveries necessary for the successful operation of the new method have been covered by patents, possibly to a greater extent than any single section of the steel industry save perhaps that of wire making. The rolling process and machinery and the subsequent processing, annealing and pickling, all come within the scope of this patent protection. It would be unfortunate if the situation were handled in any but the fairest manner, for which the leaders of the American steel industry are eminently fitted.

Schedule of the next installments of the ***Business Analysis and Forecast,*** *by Dr. Lewis H. Haney, Director New York University Bureau of Business Research, follows:* ***Jan. 12****—Activity in Steel Consuming Industries;* ***Jan. 19****—Position of Iron and Steel Producers;* ***Jan. 26****—General Business Outlook.*

Steel Trade Now Looks to 1928 to Compensate for 1927

(*Concluded from page 5*)

lands, 29,756 tons; and Sweden, 19,728 tons. This leaves 25,309 tons supplied from all other sources.

Machinery exports in the first 11 months are reported at $397,335,175. This is a gain of practically $30,000,000 over the corresponding period of 1926. If December shows up as well as November did, the total will be about $433,000,000 for the year. This is the largest export volume in a number of years. Agricultural implements made a large gain in 1926 and a further one in 1927, the total for 11 months having been $83,849,667. Heavy gains were made also in oil-well machinery, road-making machinery, machine tools, textile machinery, sugar mill machinery, refrigerating and ice machinery, air compressors, and type-setting machines. There were notable declines in automobile engines, electric locomotives, mining and quarrying machinery, and some of the smaller lines.

UNITED STATES EXPORTS OF IRON AND STEEL
(Gross Tons)

	1922	1923	1924	1925	1926	1927

---

*Estimated, as to December.

1927 Earnings Declined Sharply

Low prices and lessened production were reflected in the earnings of the leading steel companies. The contrast with 1926 was most marked in the third quarter when the United States Steel Corporation reported earnings representing a decline of $11,250,000, or more than 20 per cent, from the third quarter of 1926. Assuming that the corporation's fourth quarter profits will show a further decline, it is probable that the full year's net income will be 15 per cent under 1926. In the last three years the Steel Corporation's quarterly earnings were as follows:

Quarter	1927	1926	1925
First	$45,584,725	$45,061,285	$39,882,992
Second	46,040,460	47,814,105	40,624,220
Third	41,373,831	52,626,826	42,400,419
Fourth	....	53,503,525	42,630,840

At the annual meeting in April last year the Steel Corporation's common issue was increased by a stock dividend of 40 per cent or 2,033,210 shares and the dividend rate of $7 a year has since been maintained on the enlarged issue. This increased the quarterly dividend charge by $3,518,117. As a result only $17,775,683 was added to the surplus in the first three-quarters of 1927, as compared with $39,832,768 in the first nine months of 1926. Earnings per share of common stock in the past year were at the rate of $2.81 in the first quarter, $2.78 in the second and $2.15 in the third.

Profits of the Bethlehem Steel Corporation also showed a decline from 1926, amounting to $5,618,038, $5,048,680 and $2,788,053 respectively in the first, second and third quarters of 1927, as compared with $5,865,850, $5,348,023 and $4,550,978 in the corresponding three quarters of 1926. The $13,454,771 earned thus far in 1927, however, is almost equal to the profits for all four quarters of 1925, which amounted to $13,858,196. In the early part of the year there was some public reference to the possibility of the company beginning dividend payments on its common stock, but earnings in the third quarter at the rate of only 61c. a share on the common stock made such action a matter of the future.

The Jones & Laughlin Steel Corporation reported net profits of $9,841,816 in the first three quarters of 1927, of which $3,658,724 was earned in the first quarter, $3,576,079, in the second, and $2,607,013, in the third. This compares with $3,843,045 in the first quarter of 1926, $3,658,724 in the second and $4,257,787 in the third quarter of that year, a total of $11,759,556. The 1927 earnings represent a decrease of 16 per cent.

Net profits of the Youngstown Sheet & Tube Co., amounting to $5,857,070 in the first three quarters of 1927, were less than half of the $11,994,092 earned in the first nine months of 1926. Each quarter showed a falling off in view of the lessened demand for the company's chief products, sheets and pipe, particularly the latter, also the year's lower prices.

Republic Iron & Steel Co. earnings fell off rather sharply, particularly in the September quarter, when they were $501,992, against $1,312,266 in the third quarter of 1926. Net profits amounted to $2,534,528 in the first nine months of 1927, or about $1,250,000 less than in the corresponding period of 1926, and a little more than equaling the profits of the first three quarters of 1925.

Inland Steel Co., with net profits of $5,590,041 in the first three quarters of the year, bettered its 1926 showing for the like period by more than $500,000 and was the only one of the larger companies to show an increase. The company had considerably better earnings in both the first and second quarters of 1927 than 1926, but profits in the third quarter amounted to $1,244,021, as compared with $1,701,286 in the September quarter of 1926.

American Rolling Mill Co. Announces Refinancing Program

Announcement of a refinancing program has been made by the American Rolling Mill Co., which has sold a $25,000,000 bond issue of 20-year 5 per cent sinking fund gold debenture notes to W. E. Hutton & Co. and Harris, Forbes & Co. It is the intention of the company to call on April 1 the outstanding 7 per cent cumulative preferred stock, amounting to $11,625,300, and by July 1, the outstanding 15-year notes, totaling $6,650,000. Furthermore, from the proceeds of the bond issue will be retired the preferred stock and bonds issued in connection with the purchase last July of the Columbia Steel Co. In addition, each common stockholder of record as of Jan. 10, 1928, will be given the right to subscribe to one share at $75 for each six shares then held. Since there were approximately 926,000 common shares outstanding at the time of the company's last annual statement and one stock dividend of 5 per cent has been paid in the interim, the new subscription rights will call for the issuance of more than 162,000 new common shares at $75 a share. The money derived from the sale of common stock on this basis will be used to take care of the company's heretofore announced plans for improvements and extensions at its various plants, which will materially increase its production capacity.

Through the completion of this program, approved by the board of directors on Dec. 30, the capital structure of the American Rolling Mill Co. will be so simplified that only the common stock and the new bond issue of $25,000,000 will be outstanding. A public offering of the bond issue is expected some time in January.

Iron and Steel Prices for Sixteen Years

Monthly Averages Computed from the Weekly Market Quotations of THE IRON AGE in the Period of 1912 to 1927

IN this issue of THE IRON AGE are our two colored price charts, in which plotted lines indicate the course of prices for pig iron, billets, scrap and leading forms of finished iron and steel and non-ferrous metals in the 16 years ended with 1927. The diagrams are based on monthly averages of prices quoted week by week in our market reports from the leading selling centers. In the tables following are the monthly average prices of more than 80 products, including those on which the charts are based.

Better Forgings Produced Through Furnace Control

BY E. J. EDWARDS*

Billets Charged in Cool Furnaces and Heating Cycle Controlled by Pyrometers—Handling Equipment Also Features American Locomotive Co. Shop

RECOGNIZING that every care must be taken in the manufacture of locomotive forgings, the American Locomotive Co. has built a new forge plant at its Brooks Works, Dunkirk, N. Y. While the production consists of driving axles, engine truck and trailing axles, driving rods, crank pins, piston rods and valve motion work, the shop is completely equipped to produce commercial forgings up to 16 in. in diameter or thickness.

In 1902 a forge plant 80 ft. wide and 400 ft. long was constructed with what was then considered modern equipment. The heating facilities in this shop consisted of eight coal-fired furnaces, each with two or three doors. Over these furnaces were mounted waste heat boilers for generating steam from the hot furnace gases, the steam being used to operate the light hammers then in use. By far the larger tonnage produced in those days consisted of iron forgings; the hammers of the lighter capacity and the coal-fired furnaces were quite satisfactory for the material being forged. But with the advent of locomotives which require forgings of a larger sectional area in straight carbon as well as alloy steel, it was recognized that the heating of such material could not be handled properly in the old furnaces, nor could the proper grain refinement be obtained by hammers of such light capacity.

The new shop, which has been in operation since 1926, is 424 ft. long, 97 ft. wide and 59 ft. 7 in. high to the top of the truss. It is of modern fireproof construction throughout. Special care has been exercised in its design to provide maximum light and ventilation, as is apparent from photographs. It is interesting to note that even in midsummer there is no complaint from the workmen because of the heat. The building is equipped with a 15-ton Shaw electric traveling crane with a 70-ft. span, mounted on a runway 39 ft. from the floor. This crane runway extends outside the shop over a storage yard 150 ft. long for raw materials such as ingots, billets and bar material. A special door in the end of the building permits the crane to bring materials into the shop without difficulty.

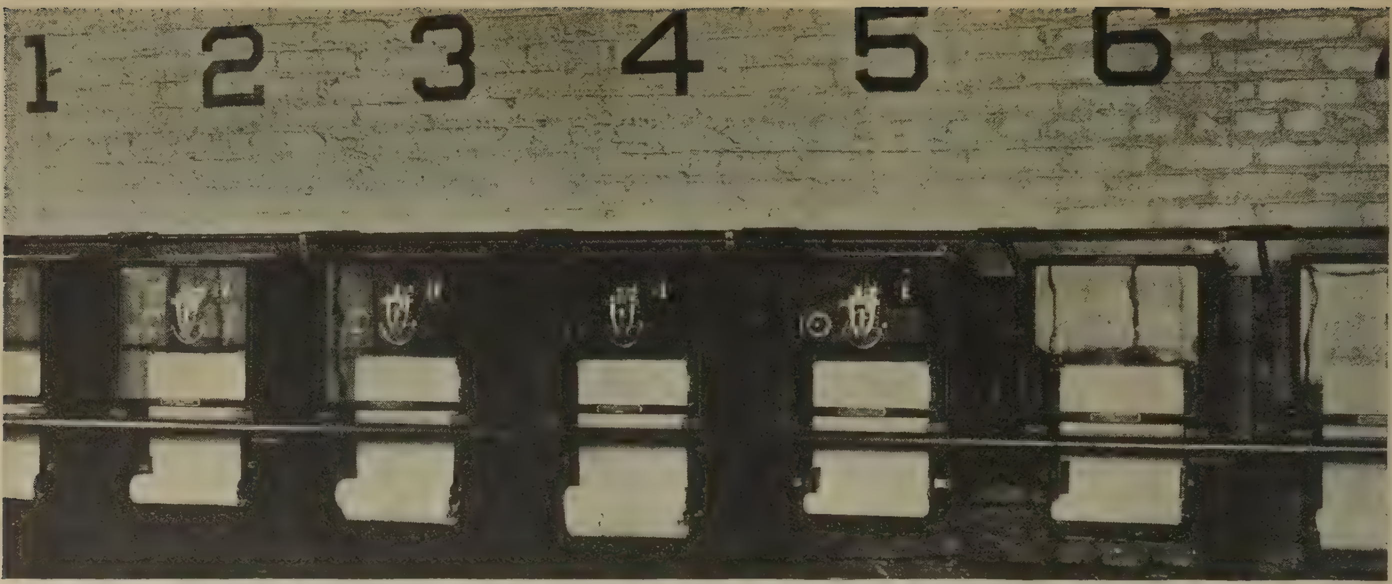
Heating before forging is of vital importance. Steel should not be charged into a hot furnace, as this often causes internal ruptures. This is especially true for the alloys and the higher carbon steels, and even for medium steel in cold weather. To avoid damage to the billets and to insure complete control over the heating of the steel before forging, six furnaces are installed which operate in two sets of three. In normal operation there are each morning two cool furnaces ready for charging, two hot furnaces containing steel ready for the press and hammer and the remaining two cooling off. These furnaces are of the regenerative type, of Stevens design and oil-fired. The chambers are 8 ft. in depth by 14 ft. in width; the capacity of each is approximately 25 tons of steel. Each furnace is equipped with two charging doors. The flame at no time comes in direct contact with the charge in the furnace.

The above described furnaces are used for the heating of steel only. Work is not confined entirely to steel, as there is still a considerable tonnage of heavy wrought iron forgings used by railroads in the United States. To heat this wrought iron, two additional Stevens regenerative furnaces were installed at the end of the shop.

All the furnaces are equipped with Leeds & Northrup indicating and recording pyrometers. The equipment illustrated gives a complete history of the forging during heating and enables one to know the rate at which the heat was applied, the time of soaking at heat to insure proper penetration and whether or not the material was withdrawn for forging at the proper temperature. The time of soaking steel and the rate at which the temperature is increased depend entirely on the cross-section of the material. In the past this important phase of the work has not been given the serious consideration due it.

---

*Engineer of Tests, American Locomotive Co., Schenectady, N. Y.



Battery of Recording Pyrometers for Controlling Heating Furnaces in Forge Shop

Bristol pyrometers to record the checker temperatures and thermostatic regulators for controlling the flow of water through the furnace jambs are also provided, together with automatic shutoffs at the fuel oil burners to safeguard against explosions. This battery of furnaces has proved to be economical from a fuel and maintenance standpoint.

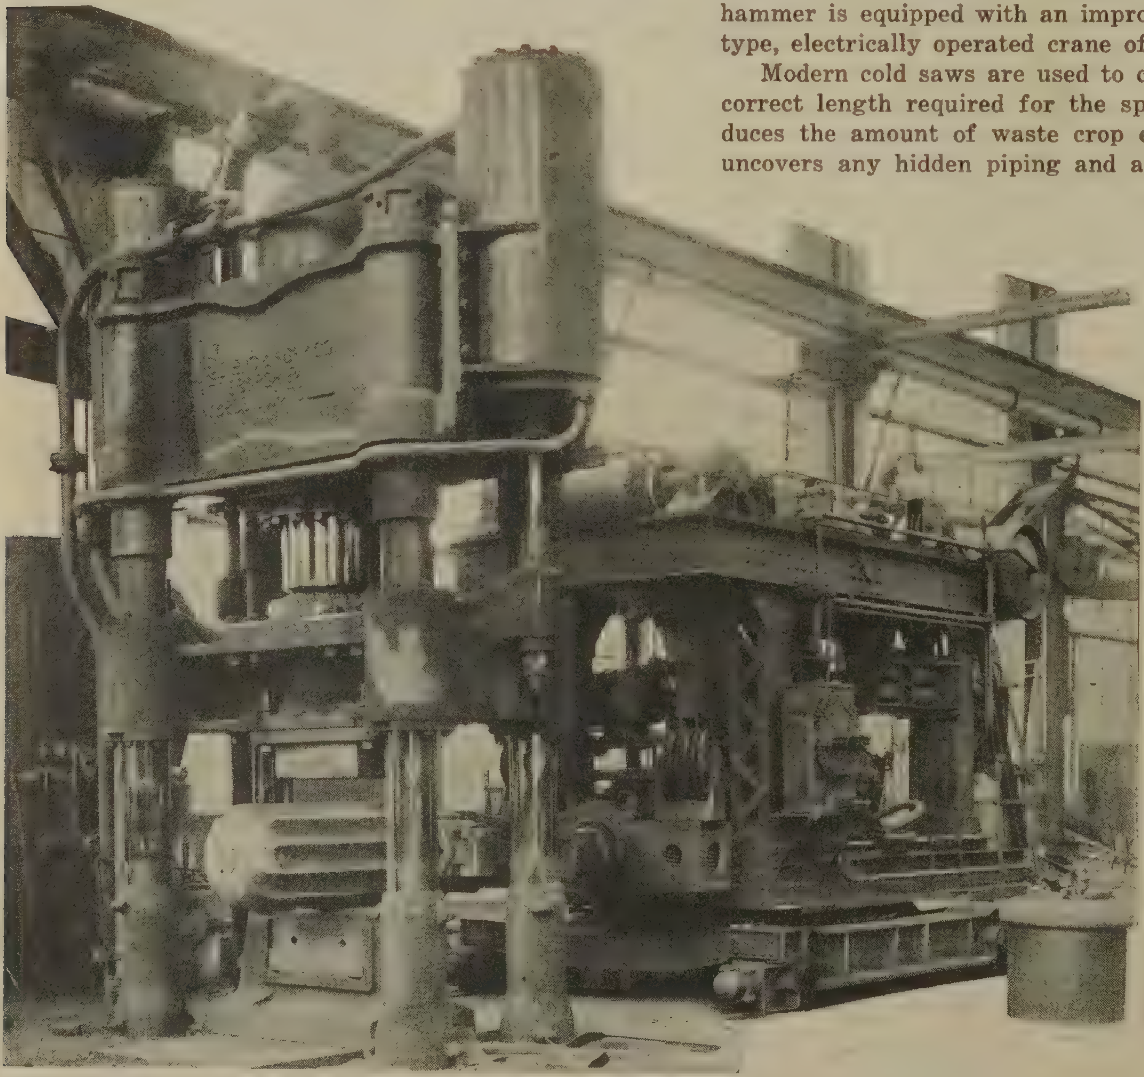
Electric Charging Machine and Manipulator

All of the large round work, such as driving and trailing axles, as well as main crank pins, are forged under a 1000-ton high-speed steam-hydraulic press made by United Engineering & Foundry Co. A manipulator of 10,000 lb. capacity, manufactured by the Alliance Machine Co., reduces materially the labor in the production of such forgings, and requires much less muscular effort on the part of those men who are needed. The manipulator moves and revolves the ingot or billet to the varied positions as required. When one end is finished, the forging is placed on a turntable alongside, and turned end for end. This scheme avoids making any tong scrap. A press of this capacity permits depth penetration and refinement in the steel, even to the center of the mass, all of which are contributing factors in producing quality.

Further to facilitate handling and reduce labor an electric charging machine operates directly in front of the furnaces on a 23-ft. gage track. This machine, with a peel 20 ft. long, is used for charging the furnaces and moves the steel from the furnace to the press or hammers as required.

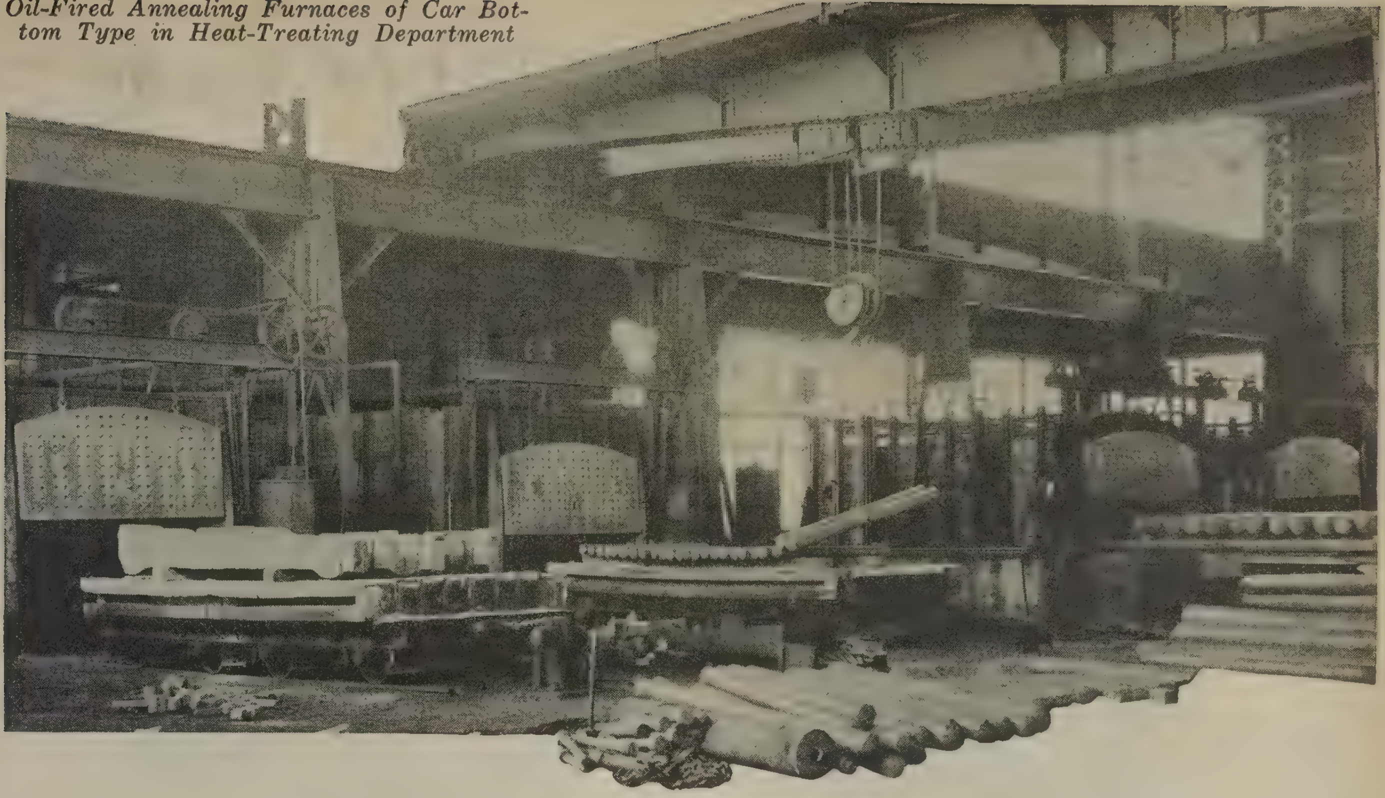
In addition to the press, the hammer equipment in this shop consists of a 12,000-lb. Erie steam hammer and three 8000-lb. steam Bement hammers for forging steel, and two 6000-lb. Bement hammers in front of the wrought iron furnaces. The heavier work is confined to the hammers of the greater capacity. Each hammer is equipped with an improved Whiting, pillar-type, electrically operated crane of 10,000 lb. capacity.

Modern cold saws are used to cut the billets to the correct length required for the specific job. This reduces the amount of waste crop ends to a minimum, uncovers any hidden piping and also reduces the cost



1000-Ton Hydraulic Press. Manipulator in right background holds fluted ingot on anvil. Turntable in right foreground

Oil-Fired Annealing Furnaces of Car Bottom Type in Heat-Treating Department



of heating for the forging. A special duplex machine for cutting axles to the required length at one setting is also installed.

Extensive Heat-Treating Department

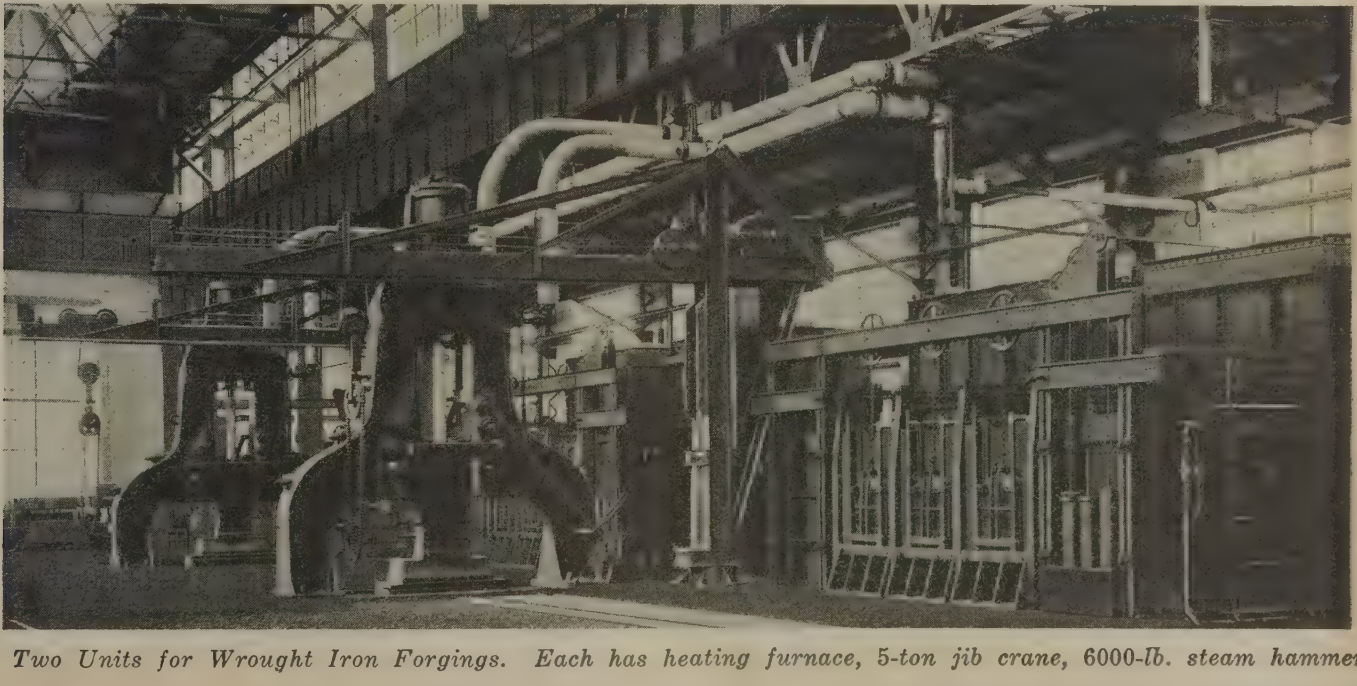
A modern forging plant would not be complete without the best in heat-treating facilities, because manufacturing is not complete until the forging has been heat treated, tested and found to meet the specified requirement.

A new heat-treating plant, 122 x 159 ft., with roof 33 ft. high, of modern fireproof construction, a complete unit in itself, adjoins the forge shop. The forgings are transferred to this heat-treating plant on cars hauled by a storage battery truck. Major items of equipment are two 10-ton electric cranes for charging the annealing furnaces—eight low-pressure, oil-fired, car-type furnaces of varied dimensions. All the furnaces are equipped with a perforated arch which keeps the flame from coming in direct contact with the materials being heated, and more evenly distributes the heat into the mass.

Forgings are loaded on the car hearth, each piece being placed on cast iron blocks which raise it about 4 in. from the hearth. Space is allowed around each of the forgings, which are charged in single tiers, all of which enables complete and uniform radiation and proper heat penetration into the forging. The annealing furnaces are equipped with Brown indicating and recording pyrometers, which write a complete history of the treatment. Each heat is also checked by the use of a Siemens water pyrometer. To avoid delays when the forgings are ready to be air-cooled, the car-body hearths are pulled out by Sprague electric car pullers, one for each furnace.

Most of the forgings are normalized and annealed, but to take care of such forgings as are specified to be quenched, a 16 x 21 x 10-ft. tank is installed. The quenching medium is cooled by a motor-driven circulating pump, which passes the liquid through cooling coils in a vertical water cooler. All of the quenched forgings are given a proof test under a drop testing machine.

Because of the exacting specifications, considerable testing is required. Test coupons are cored out with a hollow drill by means of a horizontal boring mill, which reduces the time required to a minimum. To complete the work, a modern laboratory with chemical and physical facilities is provided, all being real factors in the production of high quality forgings.



Two Units for Wrought Iron Forgings. Each has heating furnace, 5-ton jib crane, 6000-lb. steam hammer

Alloy Bearings Applied to Trains

RAILROADS have been experimentally operating passenger trains which are equipped with roller bearings in all the journals. Several trains thus equipped are on the Chicago, Milwaukee & St. Paul, the Chicago & Northwestern and other railroads. Some facts about the particular alloy steel, nickel-molybdenum, used in one type of these roller bearings, are given in this article.

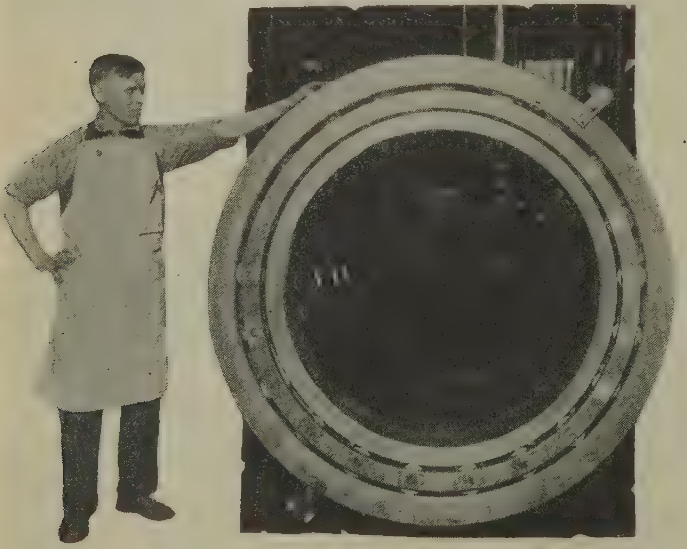
BY DR. F. C. LANGENBERG AND
CHARLES MCKNIGHT*

A COMBINATION of nickel and molybdenum in an alloy steel is not new but, due to its utilization in an industrial bearing field which is being given a great deal of prominence at the present time, it is believed that certain facts about this combination will be of interest. The authors will not attempt to give any extended bibliography on these steels, as this has been very admirably done by Dr. H. W. Gillett and E. L. Mack in their book "Molybdenum, Cerium, and Related Alloy Steels."

Nickel-molybdenum steel in the low-carbon compositions has been very satisfactorily used for several years in a number of parts such as piston pins, differential gears, ring gears, steering knuckle pins, and other carburized parts. The possibility of obtaining a fine core and a hard case after a single quench gives this composition certain advantages over other types of steel used for similar purposes. Instances are on record where large nickel-molybdenum crankshafts have been given a single quench after carburizing and a scleroscope hardness obtained between 80 and 85 after an oil quench.

Although the Society of Automotive Engineers has not yet presented a physical property chart of nickel-molybdenum steel, the data shown in the curves in the reproduced chart have been obtained from most reliable sources, and it is believed they will be of interest. The chart shows the physical properties of the core of a case-hardened steel after the treatments recommended for a steel of this composition.

Two of the illustrations show the application of two types of anti-friction bearings to a railroad journal. In both cases, the cones and races are made of nickel-molybdenum steel, case hardened. A very hard wearing surface is obtained after the proper treatment and, in conjunction with the hard wearing surface, a strength of core results which gives a high resistance to shock and impact.



Race and Cone of This Two-Ton Bearing for a Cement Mill Are Made of Nickel-Molybdenum Steel

The application of this composition is not confined to railroad bearings, as is illustrated in another illustration. This is a bearing weighing over two tons for a cement mill, in which both the race and cone are made of carburized nickel-molybdenum steel. In comparison with this bearing, it should be borne in mind that the very smallest bearings for machine tools and those in the automotive industry are likewise fabricated, and in many instances the rollers themselves are a carburized steel similar to the races and cones.

Heat-Treated: Applicable for High Temperatures

AN inspection of the physical property chart, already referred to, of the nickel-molybdenum carburized steel shows one very decided characteristic, namely, the uniformity of the elastic limit after the steel has been subjected to different drawing temperatures. This fact suggests the possibility of applying this composition for high temperature work, and with this in view certain experiments have been conducted which are outlined below.

The following chemical analysis was selected utilizing a rolled bar 2 in. in diameter:

C.	Mn.	Sul.	Phos.	Sil.	Ni.	Mo.
0.305	0.51	0.021	0.018	0.19	1.14	0.14

This was then cut into bars 12 in. long. These were then placed in a muffle furnace and given the following heat treatments:

	Deg. Fahr.
Normalize at	1,650
Quench (in water)	1,450
Draw at	900
Draw at	1,000
Draw at	1,100
Draw at	1,200
Draw at	1,300

All bars were normalized from a temperature of 1650 deg. Fahr. and then reheated to 1450 deg. Fahr., and quenched in water. Bars were then drawn at each of the following temperatures:

900 deg. Fahr.; 1000 deg. Fahr.; 1100 deg. Fahr.; 1200 deg. Fahr.; and 1300 deg. Fahr.

At least one specimen from each draw was pulled at room temperature (74 deg. Fahr.), 600 deg. Fahr., and at 1000 deg. Fahr. The table shows the draw, the temperature of the test, yield point, ultimate strength, elongation and contraction of area.

---

*The authors are respectively vice-president Climax Molybdenum Co. and metallurgist, development and research department International Nickel Co., New York.

Charpy bars broken at room temperature (74 deg. Fahr.) gave the following results:

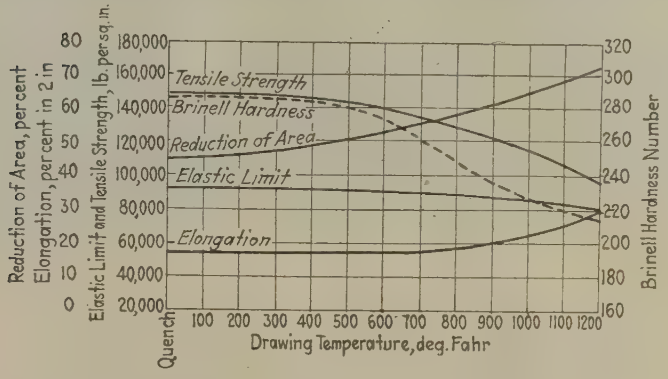
It is very obvious from an inspection of these data that nickel-molybdenum steel, in the higher carbon ranges, gives a high resistance to impact as compared to other compositions when the same physical properties as regards elastic limit and tensile strength are obtained. It is also apparent that the elastic limit at temperatures above atmospheric does not fall off as rapidly as is the case for some other compositions.

This at once suggests its use for high temperature applications, such as valve bodies and bolts. This characteristic is not being overlooked by the manufacturers of valves and fittings, and some quite interesting work is being done at the present time on the manufacture of castings, the results of which it is hoped can be made public at a later date.

Alloys in Scrap Recoverable

FROM the economical viewpoint, both nickel and molybdenum have the chemical characteristics which make them completely recoverable alloys. In other words, nickel-molybdenum steel scrap can be safely charged into any type of melting unit with the assurance that the alloying elements will be recovered in the finished heat. One plant, engaged upon the production of bearings, utilizes nickel-molybdenum steel almost exclusively.

In view of the fact that the weight of the finished bearing is only a small proportion of the metal charged into the furnace, the item of recoverable alloying elements becomes an important economic factor. In a plant fabricating its own steel, or in a plant so located that turnings and other returned scrap can be utilized, the necessity of employing an alloy steel having recoverable elements becomes exceptionally important when the article manufactured utilizes only a very small proportion of the raw material.

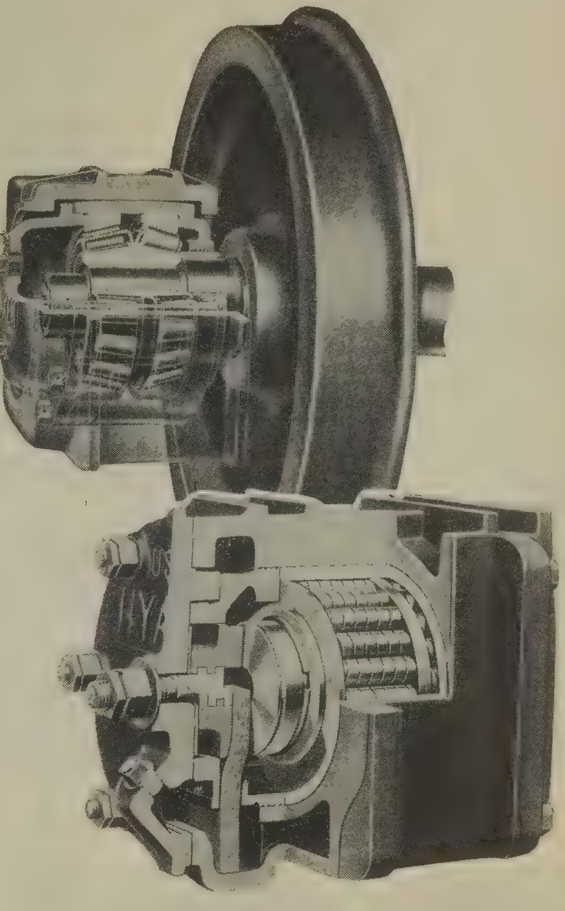


Physical Properties of Core of Case-Hardened Nickel-Molybdenum Steel, Single Treatment.

The analysis of this steel was: Carbon, 0.15; *manganese,* 0.58; *silicon,* 0.25; *nickel,* 1.62; *molybdenum,* 0.286; *sulphur,* 0.032, *and phosphorus,* 0.016 *per cent.*

The recommended heat treatment is: Forge at 2100 *to* 2200 *deg. Fahr.; normalize at* 1625 *to* 1650 *deg.; anneal at* 1550 *to* 1575 *deg. and quench at* 1450 *to* 1470 *deg. after carburizing in oil. Test pieces treated in* 1*-in. rounds*

The manufacture of ordnance was always regarded as a hazardous enterprise, due to the fact that the weight of the product shipped was so exceptionally low as compared to the weight of the product charged into the melting furnace for its fabrication. Roller bearings are very similar to ordnance in respect to the point that their finished weight does represent a very small percentage of the metal melted for their fabrication. If the application of anti-friction bearings to the railroad industry continues as is anticipated, there can be no question but what the utilization of an alloy steel having a high scrap value will be an important economic factor.



Application to Passenger Cars of Two Types of Roller Bearings Made by Two Large American Companies

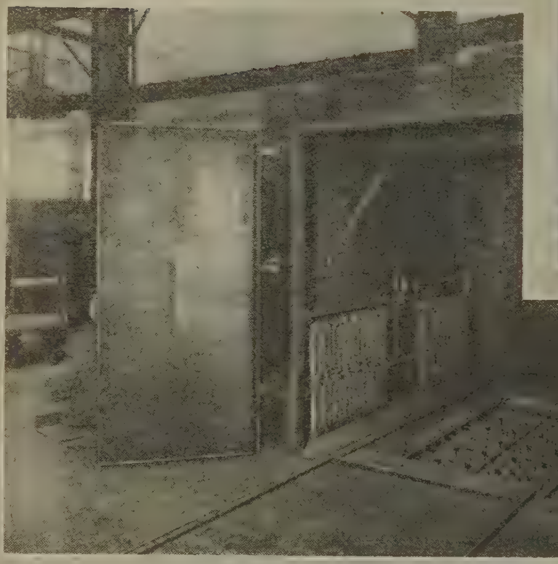
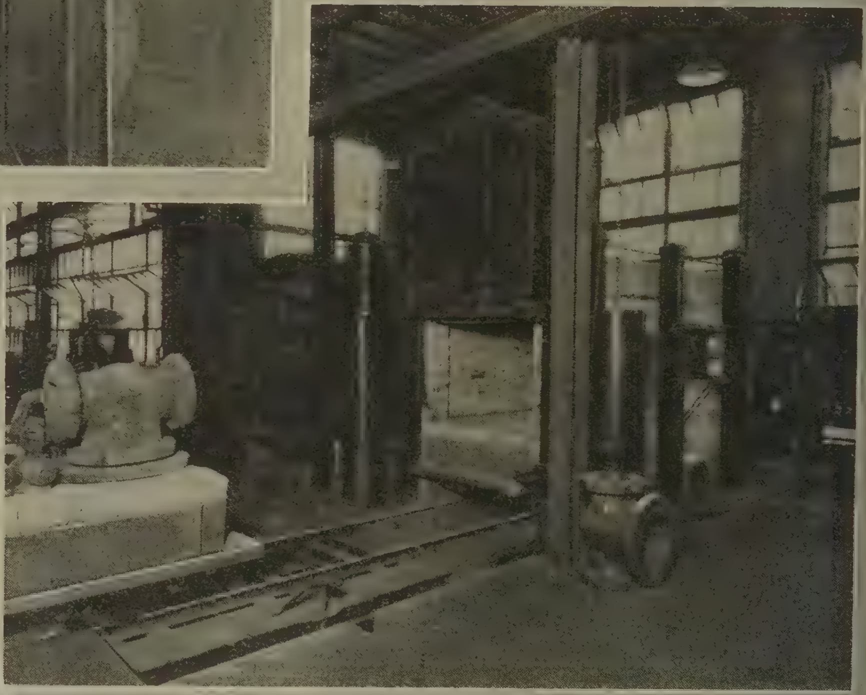
Total apparent consumption of babbitt metal in November, 1927, based on reports received by the Department of Commerce from 21 firms, was 4,505,954 lb., compared with 5,115,598 lb. in October. Total apparent consumption during the first 11 months of 1927 was 55,646,056 lb., compared with 61,426,584 lb. and 63,602,444 lb. during the corresponding periods of 1926 and 1925, respectively.

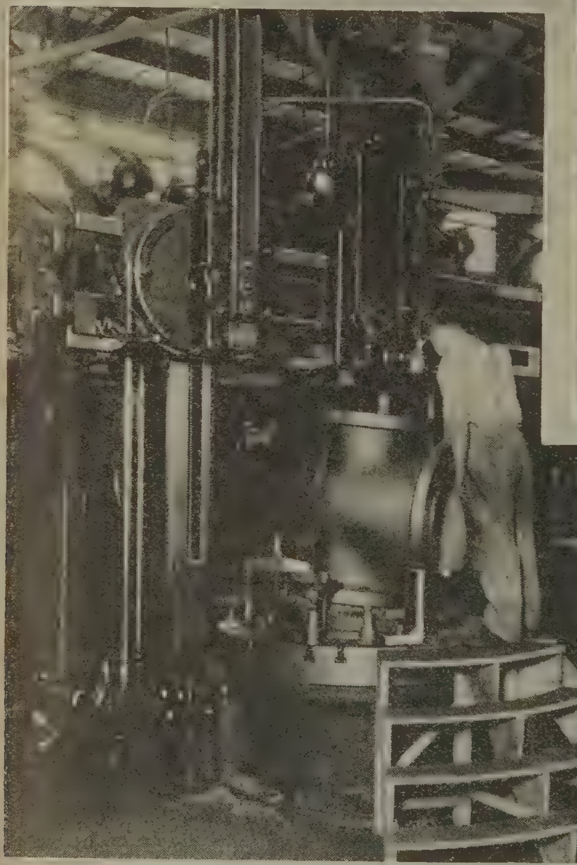
Electric Foundry of Lunkenheimer Co.

AT the Carthage plant of the Lunkenheimer Co., Cincinnati, where iron and steel valves are made, there are two 2½-ton electric steel furnaces.

INTRICATE and the more important cores are baked in electric ovens, while large, bulky cores are baked in gas-fired ovens.







FOR annealing an electrically heated furnace is used. The castings are transferred from the heated chamber to an unheated chamber for the cooling period, an arrangement making for efficient and economical operation.

INDIVIDUAL motor-driven machine tools, together with electric cranes and hoists, help to make possible one-man operation on much of the work.

Canadian Outlook Hopeful for 1928

Improvement in Steel and Related Industries Expected to Continue—Pig Iron Trade Suffers from United States Competition

TORONTO, ONT., Jan. 10.—The outlook for 1928 in Canadian industry is for a continuance of the betterment which has been in evidence for some months. While some industries have shown greater improvement than others, the industrial situation as a whole has benefited by last year's high wheat yield, the greater activity in mining operations and the increase in the supply of hydroelectric power at low cost.

In some branches of the iron and steel industry there was marked improvement in 1927, while in others operations remained at about the same level as in 1926. With the exception of the lowering of duties on a few minor products, the Government did not put further obstacles in the way of the iron and steel industry. But at the same time nothing was done to correct the situation created by tariff revisions of former years, and as a consequence the industry faced the same conditions with respect to outside competition that it had in 1925 and 1926. The reduction of the tariff on agricultural implements in April, 1925, followed by the dropping of the duty on pig iron and certain other raw materials as a compensation to Canadian implement manufacturers, deprived Canadian blast furnace operators of a part of their market, as iron from the United States undersells Canadian iron.

One of the Best Years Since 1920

From the standpoint of demand for products and plant operations, 1927 was one of the best years Canadian iron and steel mills have had since 1920. Throughout the year the principal mills at Sydney, N. S., Hamilton and Sault Ste. Marie, Ont., were in operation on almost a 100 per cent basis. Jointly these companies spent upward of $1,100,000 on plant additions and improvements. The Dominion Iron & Steel Co., Sydney, N. S., made general improvements costing $500,000; the Steel Co. of Canada, Ltd., Hamilton, Ont., spent more than $300,000 on a new sheet mill and other extensions, and the Algoma Steel Corporation, Sault Ste. Marie, Ont., remodeled its rail mill and made other changes in its equipment costing $300,000.

The Algoma Steel Corporation operated at almost full capacity from Jan. 1, 1927, until about the middle of August, when it completed rail orders on hand and blew out one of its two operating blast furnaces, shut down its rail mill and curtailed operations of open-hearth furnaces. In November the company again started up its rail mill and announced that it had 100,000 tons of unfilled rail orders on its books, sufficient to keep its mill running until spring.

The Steel Co. of Canada, Ltd., reported an exceptionally good year. Besides enjoying an active domestic business, the company closed some large orders for export.

The Dominion Iron & Steel Co. has shown a marked improvement in operations. A statement issued by company officials late in November showed that for the first time since 1925 every one of the 2600 men on the payroll of the Sydney plant was working full time six days a week, with the definite prospect that the mills would continue on that basis for the rest of the winter. At the annual meeting it was announced that the company's unfilled orders were more than 20,000 tons in excess of those it had at the beginning of 1926.

The British Empire Steel Corporation has announced that the 1928 output of its Bell Island, Newfoundland, iron mines, estimated at 1,300,000 tons, has been contracted for. Of this amount, 800,000 tons will be shipped to Germany, 400,000 tons to the company's furnaces in Nova Scotia and 100,000 tons to the United States. The company has been shipping iron ore to Germany and to the United States for several years.

Production of pig iron in Canada in 1927 showed a slight reduction from that of 1926. For the first six months, however, production proceeded at a higher monthly average than in 1926, but during the last half there was a sharp decline, due chiefly to the blowing out of furnaces at Sydney, N. S., and Sault Ste. Marie, Ont., during August, and to the closing down of one of the two furnaces at Hamilton, Ont., in September for relining. To some extent, increased importations of pig iron had an adverse effect on Canadian output. A comparison of 1926 and 1927 pig iron production figures by months is given:

(Gross Tons)

	1927	1926
January	51,717	56,644
February	50,695	49,746
March	75,637	53,251
April	77,240	67,607
May	78,987	72,762
June	69,437	70,854
July	50,997	67,232
August	63,234	58,780
September	52,470	64,187
October	38,097	79,124
November	37,989	52,347
December	*50,250	53,971
Total	696,750	737,503

*Estimated.

Production of steel ingots and castings gained about 12 per cent. Monthly outputs of steel ingots and castings are compared in the following table:

(Gross Tons)

	1927		1926	
	Ingots	Castings	Ingots	Castings
January	55,898	2,653	66,221	2,315
February	52,144	3,476	50,207	2,950
March	102,141	5,240	54,641	3,924
April	104,540	4,567	76,046	3,890
May	92,227	4,484	85,604	3,909
June	55,443	4,497	77,684	3,593
July	52,776	2,474	62,396	2,451
August	74,319	3,160	43,546	2,128
September	52,010	2,240	57,164	1,673
October	54,190	2,181	61,415	2,127
November	78,436	2,294	52,116	2,195
December	*80,250	*2,500	56,310	2,183
Total	854,375	39,766	743,550	33,338

*Estimated output.

While import figures are available only for the first nine months of 1927, they give some indication of the increase in pig iron shipments into this country. For the nine months ended with September, 1927, imported pig iron reached a total of 32,940 tons, as compared with 21,433 tons for the corresponding nine months of 1926. Of the nine months' imports, 27,887 tons came from the United States as against 13,946 tons from this source in the same period of 1926.

Improvement in Other Industries

Foundry operations throughout the year showed a slight improvement compared with 1926. In the agricultural implement industry there was general improvement and greater output. With the large crop yield in the Canadian West, this industry expects even better conditions for this year.

The index of Canadian industrial production for the first 10 months of 1927, compiled by the Dominion Bureau of Statistics, set an average monthly level of 156.3, a gain of 10.4 points over the average level of 145.9 for all of 1926, and a still broader improvement over 1925, which was 128.8.

Constituents of Annealed Steel

Frequently Include Massive Cementite in Addition to Ferrite and Lamellar Pearlite

BY JAMES J. CURRAN*

TEXTBOOKS on metallography usually focus the reader's attention on the statement that lamellar pearlite is the normal condition of the eutectoid in slowly cooled plain carbon steels. That this is by no means true is known to experienced observers, and demonstrated by the micrographs below. Spheroidized or massive pearlite may be produced in steels of any carbon content by proper anneals. Three constituents in one field represent an intermediate stage in the change from lamellar pearlite to massive cementite (spoken of in advanced textbooks as the most stable constituent containing carbon).

Massive cementite in a plain carbon steel containing less than 0.10 per cent carbon may be new to many. In the top row is the conventional appearance of a rivet steel, magnified 50 diameters, after etching 30 sec. in 1 per cent nital. The center view represents a similar view, magnified 250 diameters. The dark areas here are not fine grained pearlite, but massive cementite, as proved by the right hand view of the same specimen, after repolishing and etching in alkaline sodium picrate.

The groups below represent three carbon steels, each annealed at two different temperatures. The anneals were applied to adjoining sections of the same bar in the forged, normalized, and air-cooled condition. The microphotographs show that long heating near the critical temperature will break up lamellar pearlite and materially soften the steel. The lower six are etched 30 sec. in 1 per cent nital and magnified 250 diameters.

No Retreat From World Steel Markets

Banker's View That Exports Be Reduced Vigorously Refuted on Ground of International Relations, Domestic Economy and Merchant Marine

BY A STEEL EXPORTER

AN ADDRESS was given before the Academy of Political Science on Nov. 18, 1927, by O. H. Cheney, vice-president American Exchange-Irving Trust Co., in New York, and published one week later in the *Annalist*. It was entitled "America in the World Steel Markets—A Warning," and asked the question "Should the American steel industry let the foreign steel producers take away its world markets?" answering it with the words "It should."

This pronouncement, while little commented on in the press, has been a subject of criticism in business circles. At THE IRON AGE'S invitation, I present some facts, which while generally well known to those engaged in foreign trade, are apparently not so well known elsewhere.

European Steel Exports Expanding Rapidly

Mr. Cheney said:

> "The export business of Europe's steel producers means the very life of Europe's fundamental industry. The recovery and maintenance of that industry is at the very heart of the recovery of international economic stability. Continued instability would be the price we would have to pay and make Europe pay for insisting on a growing export market for steel and other commodities."

Earlier in the same article it is stated that the continental European producers have recovered from the war and that in 1926 their total exports exceeded prewar totals; also, that in 1927 the world is 10 per cent ahead of 1926 in steel production. So far then from the progress of recovery of the European nations having been hindered by our comparatively small tonnage of exports of iron and steel products, the European steel industries have already secured as large a share of the total world business as even the most optimistic could have expected. Note the following figures showing the change in export trade:

Germany	1,307,000 tons in 1923	4,887,000 tons in 1926
France	778,000 tons in 1921	4,183,000 tons in 1926
Belgium	902,000 tons in 1921	3,761,000 tons in 1926
United States..	1,988,085 tons in 1922	2,167,048 tons in 1926

These figures, coupled with the declining ratio of American exports, clearly disprove any contention that American exports had made inroads on the annual increase secured by continental European manufacturers, or affected the steady increase in production and exportation of European steel.

American Sales Made on Quality Rather Than Price

The fact of the matter is that there are many customers and markets in the world which are willing to pay such a substantial premium for American quality that this export business is obtainable, with the exercise of considerable effort, notwithstanding the discrepancy of higher costs, wages, inland and ocean freight rates and discriminatory duties. Furthermore, much export trade of the United States in iron and steel products is with Canada and certain other nearby countries, which, because of their proximity, are natural markets for this country.

The article further says:

> "If our export business in iron and steel could possibly be increased, it could only be by a bitter price-cutting struggle."

Of course, the assumption here is that this struggle would be solely due to American efforts to secure more export business, whereas the fact is that for many years past there has been a bitter price-cutting struggle for export business between the various European manufacturers. So disastrous has this condition been to the European manufacturers generally—involving the selling of heavy tonnages at less than the net cost of manufacture, even at the low rates of wages and other conditions prevailing in Europe—that a number of international cartels have been formed for the limiting of production and the apportioning of estimated demand. These have not, however, been as yet successful in securing the desired effect; recent press advices are to the effect that efforts are now being made to establish joint selling agencies which will be able to maintain more satisfactory prices and apportion the orders among the various manufacturers in accordance with their cartel agreements.

During the last 25 years there has never been a time (except during the World War and the years immediately following it when European competition was discontinued) when that competition was not encountered on a basis of lower costs and consequent lower prices. It is worthy of repetition that the American exports of steel have been accomplished, not by cutting prices below those of European competitors, nor even by meeting their prices when that would involve too great a sacrifice, but principally by furnishing material of superior quality and adaptability for the purposes for which it was intended, for which foreign customers have been willing to pay a premium over the prices of cheaper but inferior European material.

Much Study Given to Technical Problems

A further criticism by Mr. Cheney is:

> "If the American steel producers could devote the knowledge and thought needed in developing export business against desperate foreign competition to solving their urgent domestic problems the returns would be many times greater." The article also suggests that "if the steel industry could strive to regain some of the market now being given up to cement it would not only increase volume but would have to gain some new efficiency in the process."

This ignores so much that is going on in the steel industry of this country that a detailed reply is unnecessary in these columns. It is, and has been for many years past, the constant and earnest endeavor of the principal American producers of iron and steel products, to solve problems of every kind in the conduct and development of their industry. The paper entitled: "Technological Problems of the Steel Industry," which was read by William A. Forbes, assistant to president United States Steel Corporation, at the Oct. 28, 1927, meeting of the American Iron and Steel Institute, is illustrative. The final statement in this pamphlet read in part:

> "The United States Steel Corporation and its subsidiary companies operate 179 laboratories devoted to chemical, physical, microscopical, metallographical and other testing, these laboratories directly requiring a total force of 2115 employees, and the rest of the steel industry of this country unquestionably has proportionately as many."

But what is of more importance, not only to the steel industry itself, but to the nation as a whole, is to have a correct appreciation of reasons for maintaining and expanding our export business in iron and steel products.

In the first place, the lowest costs of production are only possible if the mills are operated at a high percentage of capacity. Plants which are wholly or partly closed down constitute a heavy charge upon production, and increase costs. Experience has shown that export orders have frequently enabled continuous operation of mills which would have been compelled to close for an extended period had they been dependent alone on domestic orders. Continuous operation of these mills reduced the average cost of their products, and this was undoubtedly reflected in the prices at which they were sold—not only to the foreign purchasers, but also to the domestic trade—likewise in reduction of unemployment and in maintenance of high wages.

Heavy Steel Exports Necessary for Efficient Merchant Marine

Another important reason for maintaining and extending our export trade in iron and steel products is the necessity for providing outward bound heavy-weight cargo for our merchant marine. We presume that no one will question the advantage to this country of an adequate merchant marine. It is generally recognized desirable that at least 50 per cent of our inward and outward sea-going cargo should be carried in American vessels. This desirable percentage has not yet been attained; in 1920, 42 per cent of the nation's foreign trade was carried in American ships, but at present only about 30 per cent. Even this quantity is being carried at the expense to the taxpayers represented by the deficit from the operation of the fleet of the United States Shipping Board. Economical operation by private American owners under the existing laws is also extremely onerous.

A ship cannot be operated without heavy loss to its owners—or in the case of Shipping Board vessels to the taxpayers of the United States—if it can obtain a full cargo only one way and has to be operated in the other direction in ballast or with only a small, inadequate amount of cargo. Furthermore, it cannot be safely or economically operated with only what is known as measurement cargo, i.e.: light weight cargo. One of the best and most convenient classes of dead weight cargo consists of iron and steel products, the very kind which Mr. Cheney thinks we ought to cease selling for export.

It is not merely a question of the cruder forms of iron and steel, as the exports of the United States also include very respectable quantities of finished products into the manufacture of which steel largely enters. For instance, during the ten months, January to October, 1927, there were exported from the United States over $167,000,000 worth of industrial machinery and over $78,000,000 worth of agricultural machinery, all of which naturally had to compete in quality or price with similar products of European manufacturers. There would not seem to be any difference in principle between developing an export business in steel products generally, which Mr. Cheney deplores, than in machinery, or, for that matter, in automotive vehicles which apparently are approved by him. It is estimated that American exports in automobiles in 1927 will be close to $475,000,000, a gain of some $50,000,000 as compared with 1926.

Exports of Other Industries Compete with Europeans

The total value of exports of steel manufactures—except machinery and vehicles—as given by the Department of Commerce, for the first ten months of 1926, and the same period in 1927, is as follows:

	1926 (10 Months)	1927 (10 Months)
Iron and steel semi-manufactures	$73,452,000	$74,471,000
Steel mill products manufactures	66,871,000	62,015,000
Iron and steel advanced manufactures	62,715,000	61,099,000

The two latter items are understood to cover the direct exportation of iron and steel commodities now under discussion, but are inclusive of commodities which few of the steel mills export. Compare these figures with the total value of exports of industrial machinery and agricultural machinery for the first 10 months of 1927, which is $719,479,000. We also find that in the first 10 months of 1927 there were exported:

Textiles—manufactured and unmanufactured	$798,499,000
Wood and paper products.............	161,829,000
Non-metallic minerals	555,472,000
Chemicals and related products.......	109,568,000
Miscellaneous manufactured goods.....	113,143,000

It would be interesting if Mr. Cheney would give an analysis of the relative advantages and disadvantages of stopping exports of these various classes of goods, as compared with the stoppage of exports of steel, and of the resulting economic consequences to the respective industries.

Repercussions of 5 Per Cent Steel Curtailment

To refute, therefore, more specifically the question and answer in the *Annalist*, "Should the American steel industry let the foreign steel producers take away its world markets? It should," by *reductio ad absurdum*, let us assume the impossible postulate that there were an embargo against steel exports—or what is equally absurd, an agreement by all American steel manufacturers that they would do no export trade. On the basis of there being 600,000 direct employees in the steel industry and its collateral branches engaged in the production or transportation of steel or its components, there would be a theoretical reduction of 30,000 employees, due to the discontinuance of 5 per cent of the total steel production of the country now exported.

This would represent a total of 150,000 persons, consisting of such employees and their dependents, having a present annual income of approximately $50,000,000.

The recurring purchasing power of this $50,000,000 spread over the numerous necessaries of life might easily involve an eventual contraction of some $400,000,000 of commodity exchange. It is conceded that the contraction of employment would not amount to the full 30,000 people now engaged in the manufacture of export steel. A large proportion of this number would necessarily be given modified or reduced employment, but the full effect of the curtailment would be found in the increased costs of manufacture. This increase—so long as the mills of this country could not replace the lost export tonnage with domestic business—would necessarily be reflected in higher prices to the consumer, or in a reduction in profits to the steel industry. On the normal basis of operation at some 15 to 25 per cent less than maximum capacity, a competitive struggle to obtain a relatively larger share of the domestic business would naturally ensue, and bring a logical tendency in the direction of both higher costs and lower selling prices. Thus, instead of the return of 5.33 per cent on the investment which is obtained from the steel industry today (which return the article deplores as insufficient), the condition of still lower dividends would, no doubt, be created—until such time as domestic consumption, without the aid of exports, should overtake production. To what extent this curtailment in turn would create further depressing factors, coupled with a reduced volume of business due to decreased employment in the steel industry, must be left to the further imagination of the economist.

Danville Structural Steel Co. Sold to Charles M. Schwab

The Danville Structural Steel Co., which operates two plants at Danville, Pa., has been sold to Charles M. Schwab. The transaction was announced by Clarence Weymouth, Mr. Schwab's representative. The company was capitalized at $900,000 and was headed by Carlton S. Wagner, a nephew of Mr. Schwab. It was formed by a merger of the Danville Structural Tubing Co. and the Pennsylvania Brake Beam Works. The plants have been shut down temporarily for overhauling. Mr. Weymouth said that orders would soon be in hand sufficient for six months' operation.

Wabana Ore Mines Produced Record Tonnage in 1927

WASHINGTON, Jan. 10.—Between Jan. 1 and Dec. 11, 1927, the record tonnage of 1,151,923 tons of iron ore was taken from the mines of Newfoundland, according to a report received by the Department of Commerce from Consul Avra M. Warren, St. Johns. Production was confined entirely to the Wabana mines at Bell Island. Shipments totaled 1,333,622 tons, of which 800,000 tons went to Germany, 61,030 tons to the United States and 472,592 tons to the furnaces of the operating company, the Dominion Iron & Steel Co., Sydney, Nova Scotia.

Turret Lathe for Bar Work Up to 2½-In. and Chucking Work to 12-In.

A new turret lathe, designated as the 1L and intended for bar work up to 2½ in. and chucking work up to 12 in., has been added to the line of the Gisholt Machine Co., Madison, Wis. The machine is of the same general design as the company's 2L turret lathe described in THE IRON AGE of Sept. 1, page 552, and features include cross feeding or fixed center turret; power rapid traverse to the cross-slide, the side carriage and to the turret carriage.

The headstock is of rectangular box design with walls carried well above the spindle bearings. The headstock cover is a flat plate carrying only the operating levers. Spindle bearings are of the same adjustable taper design as in other of the company's turret lathes, except that tapered roller bearings are employed. The headstock drive shaft, intermediate shaft and reverse shaft are also mounted on tapered roller bearings.

The single drive pulley runs at 600 r.p.m. Twelve spindle speeds, ranging from 20 to 486 r.p.m., are provided through sliding gears and positive jaw clutches mounted on splined shafts. The spindle control lever, located just back of the spindle nose, operates a multiple-disk clutch on the drive shaft for starting or reversing the spindle, and when placed in neutral engages a brake which instantly stops the spindle. This clutch is made up of saw steel and phosphor bronze plates, running in oil, and when necessary it can be adjusted without opening the headstock.

From the headstock to the final drive of the carriages all power shafts are mounted on ball bearings. The upper of the two shafts along the front of the bed rotates at suitable speed for feeding the aprons, while the lower shaft rotates at higher speed for the rapid traverses.

The full universal, full swing, two carriage principle of the company's larger turret lathes has been employed in the design. A fixed center turret is standard equipment and a cross feeding turret is optional. Eight independent reversible feeds are incorporated in each apron, with another range of eight feeds, each slightly coarser, available through a lever at the headstock end. Longitudinal rapid traverses are provided for both carriages, with automatic stops at the extremes of travel. Rapid traverse is also provided for the in-and-out movement of the square turret tool post on the cross-slide. Engagement of the traverses is made through serrated tooth clutches of hardened steel, and a low-power friction is carried on the traverse drive shaft to cushion the traverse action and to serve as a safety. It is stated that the two carriages may collide in traversing or be run against a dead stop without danger of breakage.

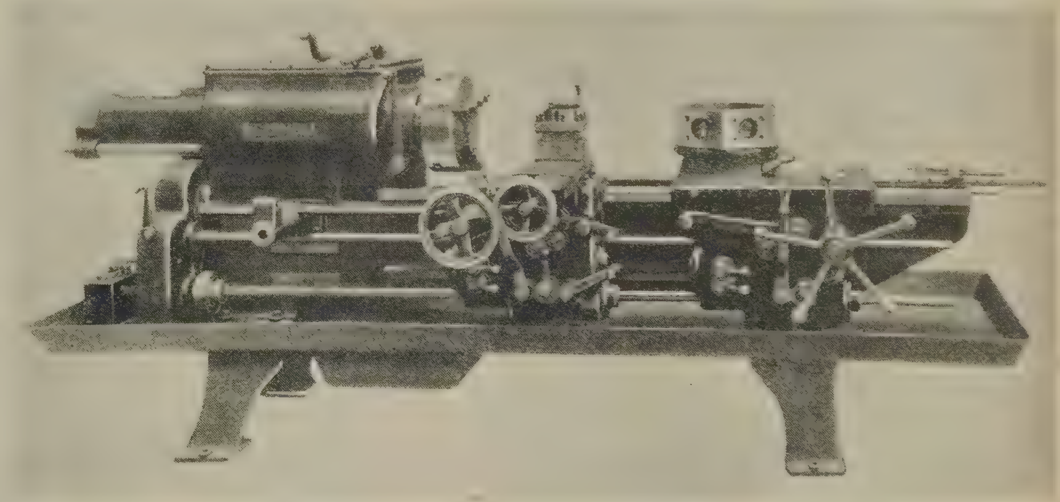
The square turret on the cross-slide automatically indexes one quarter turn as the clamping lever is released. The hollow hexagon turret is of thick section and is clamped to its base by a double-bevel steel clamping ring operated by a compound toggle. A tapered index pin seating in hardened bushings locates the turret holes central with the spindle but the strain of the cut is entirely taken by the bevel clamp ring. Automatic trips are provided for the longitudinal feeds of both carriages, and for the cross movement of both square turret and cross feeding turret.

Hardened steel plates, of 75 Rockwell hardness, cover the ways of the bed, these plates being securely attached with heat-treated alloy steel taper head screws and ground in place. Each movement of the rapid traverse lever, whether forward or back, feeds a small amount of oil by pressure from a plunger in the apron through the under side of the carriage to the ways. Dirt and chips are excluded by felt and brass wipers.

The headstock gearing and clutches run in a bath of oil, a part of which is collected in a splash box, strained and carried to the spindle bearings. Feed train and traverse drive are lubricated with fresh oil from a Madison-Kipp automatic lubricator. Each apron contains its own oil reservoir from which its gears are constantly lubricated by the splash system.

For motor drive, the motor may be mounted either on the headstock or on a special back plate and connected by Texrope, flat belt or silent chain. A 1200-r.p.m. motor of 3 to 7½-hp., depending on the nature of the work, is recommended. An improved power-operated bar feed, consisting of a screw driven carrier coupled by a flat cone friction clutch to the headstock power, is provided. An automatic chuck with master collet and size pads is operated by the same lever as the bar feed. A 12 in. three-jaw universal chuck is standard equipment for chucking work, but air chucks or wrenchless chucks can be furnished. Taper attachment, lead-screw thread chasing attachment and a complete line of bar and chucking tools are accessory equipment.

The maximum swing over the ways is 17 in.; and over the side carriage, 14 in. The maximum distance from the face of the hexagon turret to the end or the spindle nose is 45 in. The weight of the machine without tools is 4900 lb. net.



Cross Feeding Turret Is Optional Equipment. Longitudinal rapid traverses are provided for both carriages, and rapid traverse for the in-and-out movement of the square turret tool post on the cross-slide

---

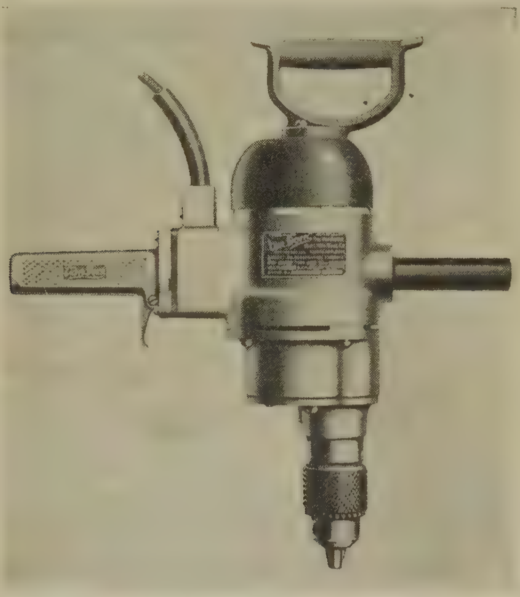
Bankers to Give Views on Scientific Management in Industry

The interrelation of finance and scientific management has been selected for discussion at a series of three meetings planned by the New York section of the Taylor Society.

The first, a dinner meeting to be held Jan. 19 at the Fraternity Clubs, New York, will be addressed by F. W. Shibley, vice-president of the Bankers Trust Co., New York, on "A Banker's View and Experience of Scientific Management in Industry." The chairman of the meeting will be Henry Bruere, first vice-president of the Bowery Savings Bank, New York. The second meeting, Feb. 16, will be devoted to "The Common Interests of Modern Banking and Business Management," and the third, planned for March 15, will be on "What Interest Has the Investment Banker in Scientific Management?"

Portable Drill for Use in Maintenance Work

A new standard ½-in. electric drill, designed particularly for maintenance work in metal-working and other plants, being adapted in power, weight and speed for use by millwrights, plumbers, electricians and general repair men, has been added to the line of the Van Dorn Electric Tool Co., Cleveland.



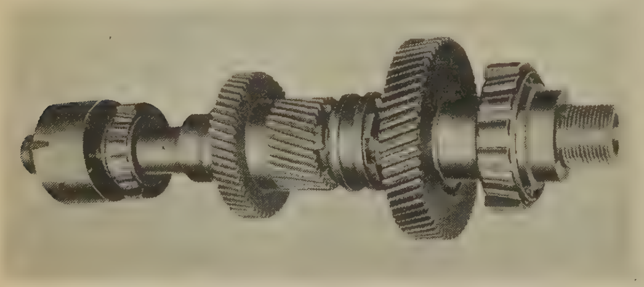
The Armature Is Mounted on Ball Bearings and Thrust Is taken on Ball Bearings

The motor operates on either alternating or direct current and has a no-load speed of 540 r.p.m. and full-load speed of 300 r.p.m. The drill has a ball bearing armature and spindle thrust, and hardened alloy steel gears. An automatic safety switch is also a feature. The capacity is for drilling up to ½ in. in steel. The weight of the machine is 14 lb., and the length, overall, is 15⅝ in. Equipment includes a combination spade and breast plate handle, a three-jaw screw-back chuck and 10 ft. of cable, with plug. The drill is furnished for 32, 110, 220 and 250 volts.

Offers Lathes with Tapered Roller Bearing Spindle Mounting

The Monarch Machine Tool Co., Sidney, Ohio, is offering its 14-in. to 30-in., inclusive, helical geared-head lathes equipped with spindles mounted in precision-type Timken roller bearings. This spindle mounting, which is optional extra equipment, is emphasized as providing greater rigidity and extreme accuracy.

These bearings are made to tolerance limits of 0.0002 in. to assure accurate spindle alinement. End thrust of the spindle is taken against the front bearing. In mounting the bearings an initial thrust load is imposed, thereby removing radial as well as end movement of the spindle. Although only infrequent adjustment should be necessary, means for adjustment are provided. With a spindle mounted in plain bearings a film of oil between the bearings and the spindle is always necessary. With the anti-friction bearings, it is pointed out, the metal-to-metal contact permits taking of heavier cuts without chatter or vibration. Ease of replacement of the roller bearings, should replacement be necessary, is another feature stressed. Filtered oil is supplied to both spindle bearings.

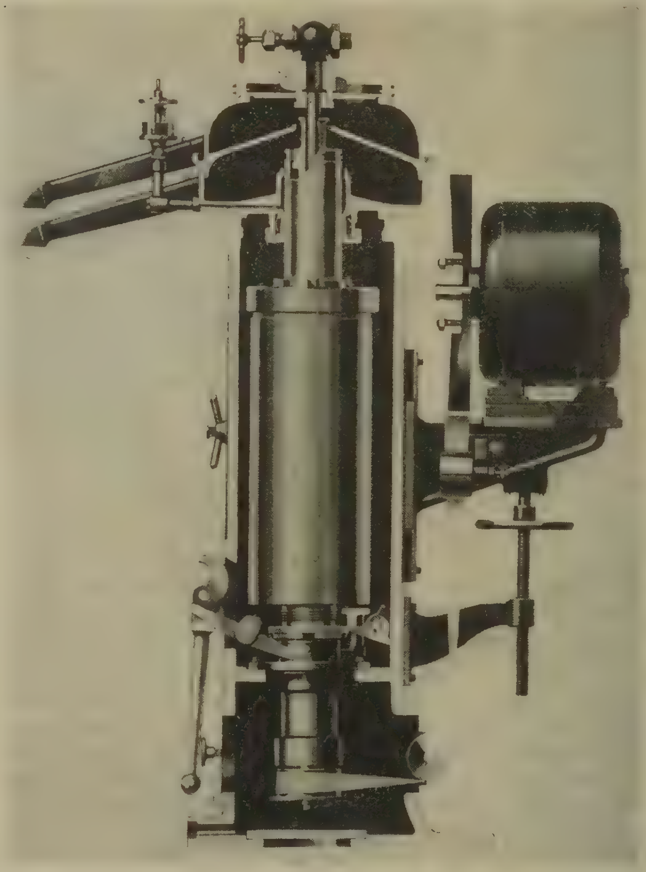


End Thrust of the Spindle Is Taken Against the Front Roller Bearing

Centrifugal Separator and Clarifier for Cutting Oils and Compounds

A centrifugal separator and centrifugal clarifier adapted for use in metal-working plants for the removal of dirt, sand and other foreign material from cutting and lubricating oils and cutting compounds, is being marketed by the Positive Machinery division of the National Acme Co., Cleveland.

The machine combines two units and may be converted conveniently from a separator into a clarifier, although it also clarifies during the separating operation. Features include a bowl of large capacity to permit long runs without cleaning, and facilities for the handling of the large bowl by one operator, without the use of chain blocks. The filter cylinders, which are continuously self-cleaning, centrifugally, are pointed out as combining the filtering principle with centrifugal force. Material is forced through 100 in. of travel or four centrifugal treatments in thin layers during one passage. Simplicity of design and ruggedness are also features emphasized. The step bearing rides on two ball bearings and the bowl is supported by a large bronze bearing. Bowl, cylinders and pulleys are statically and dynamically balanced. The top bearing is designed to assure uniform operation when the machine is mounted on a portable truck or otherwise subjected to uneven operating conditions. A patented handbrake is provided at the bottom of the bowl to stop the machine quickly.



Clarifier of Stationary Type with Side of Housing Removed. The base measures 20 in. square and the height to the intake is 53 in.

Multiple-speed or constant-speed driving motors may be furnished. In the case of multiple-speed motors bowl speeds are indicated by means of a scale, and on constant-speed motors by standard diameters of pulley, three of which are furnished. A tachometer may be attached to the motor shaft.

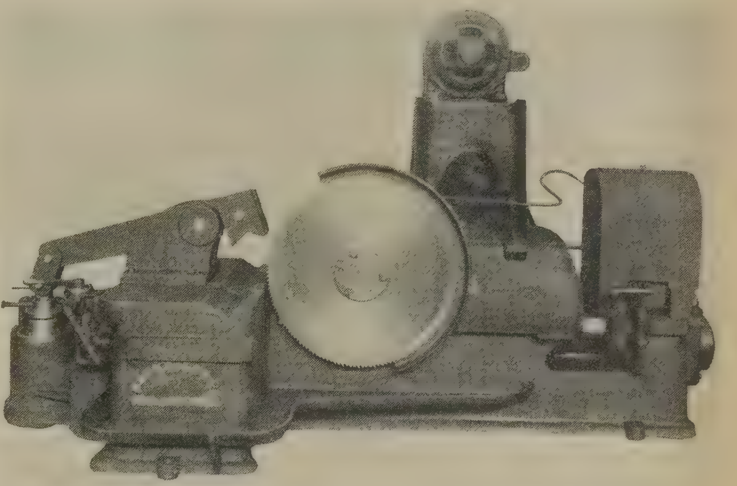
The separator is converted into a clarifier by interchanging the separating disk with the clarifying disk, and removing the middle pan with its spout. For cloudless products, the standard inner cylinders in the clarifier and separator are replaced with filter cylinders. The clarifier is fitted with a strainer, which may be removed conveniently for cleaning without disturbing the hose connection. A motor-driven pump, flexible metal hose for attachment to the intake, and a control valve, are furnished. The flexible hose may be detached and the machine fed by gravity.

High-Speed Sawing Machine for Billets and Other Material

High production, due not only to fast sawing but also to quick handling of material and rapid functioning of the machine between saw cuts is the main claim for a new semi-automatic high-speed sawing machine of the Espen-Lucas Machine Works, Philadelphia.

The machine was designed for use in cropping the ends and the sawing to length of cast, solid and tube billets, it being required to supply an extruding mill at the rate of two sawed billets per minute. The machine saws through 7 in. diameter solid billets in 7 sec., and the time required for clamping and unclamping is 3 sec. The output is dependent therefore upon facilities for passing the work through the machine. With suitable apparatus the complete cycle of operations has been made in 15 sec.

Features include quick-return and quick-feed traverse to the saw carriage by the maker's low pressure (hydraulic) oil feed system. A quick-acting clamp which may be operated either by air or oil pressure is incorporated. All controls are at table end. Material may be passed from the machine without the workman touching it. The drive may be either by direct or alternating current motor, by constant, multi or variable-speed motor.



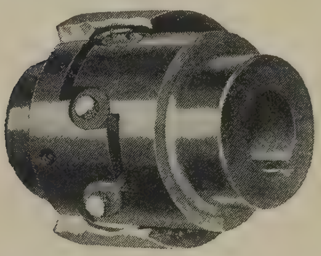
Rapid Traverse of Saw Carriage Is by Hydraulic System

Coupling with Wide Range of Flexibility

Unusual range of flexibility is claimed for the L-R flexible coupling here illustrated, which has been brought out by the Lovejoy Tool Works, 319 West Ohio Street, Chicago. Angular misalinement up to 7½ deg. in each direction; parallel misalinement of 1/16 to 3/16 in. and endwise shaft movement of ¼ to ¾ in., are said to be made possible without loss of efficiency.

The device is a jaw coupling with radially disposed loosely floating resilient rollers, placed between jaws which extend from the flanges parallel with the shafts. This arrangement is intended to assure rolling contact between the rollers upon relative movement caused either by misalinement or end movement of the shaft. Either solid rubber or rubber covered metal rollers are employed, as conditions require, and an external sleeve is provided to prevent the flying out of idle rollers under centrifugal force. The coupling may be used for rotation in either direction, half the rollers being under compression and the other half being idlers.

It is stated that inasmuch as the force is transmitted by compression, and relative movement of the shafts is accomplished by a rolling movement of the power transmitting elements, not only end thrust in the shaft will be absent, but also radial thrust. It is claimed that the life of the coupling is therefore long and the coupled equipment made safe and shockproof.



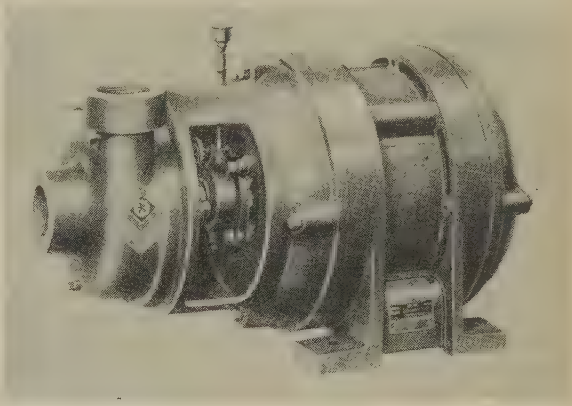
Floating Rollers Between the Jaws Are Important Elements

Other features include noiseless operation; balance, permitting any speed; and convenience of replacing rollers without removing members. No lubricant is required. The device is available in several sizes for shafts up to 5 in. in diameter.

The Kalman Steel Co., Chicago, has purchased the plant and assets of the Sykes Metal Lath & Roofing Co., Niles, Ohio, and is reported to be considering a plan to consolidate its Youngstown and Niles properties and create a fabricating unit.

Centrifugal Pump With Pump and Motor Combined in One Unit

Centrifugal pumping units which combine motor and pump, arranged as illustrated, have been brought out by the Allis-Chalmers Mfg. Co., Milwaukee. Compactness is a feature, the complete machine being not much larger than a motor alone. In these machines, which are designated as the type SSU, the pump impeller is fastened to one end of the extended motor shaft, which is of liberal diameter, and the pump casing is bolted to an integrally cast extension of one of the motor end housings. This arrangement is emphasized as providing simplicity of construction, eliminating a base plate, coupling and pump bearings, and as assuring alinement between the pump and motor. The motor bearings, which are the pump bearings as well, are oversized Timken tapered roller bearings. They have ample thrust and radial capacity, and are mounted in dust and grease tight housings. Renewal of the lubricant is necessary only at infrequent intervals.



The Pump Impeller Is Fastened to One End of the Extended Motor Shaft

The pumps are available in 1¼-in. x 1¼-in.; 1½-in. x 1½-in.; 2-in. x 2-in.; and 2½-in. x 2½-in. sizes, and can be used with 1-, 1½-, 2-, 3-, 5- and 7½-hp. motors. Capacities range from 25 to 200 g.p.m. against heads from 50 to 100 ft.

Pratt & Whitney Airplane Motors to Be Built in Germany

The Pratt & Whitney Aircraft Co., Hartford, Conn., announces that it has sold the manufacturing rights in Germany to its airplane engines to the Bavarian Motor Works of Munich. The Bavarian Motor Works is one of the oldest engine building concerns on the Continent. For several years it has made water-cooled engines for aircraft, but negotiated for rights to manufacture the Pratt & Whitney air-cooled motors rather than to develop a design of its own. The Pratt & Whitney company is producing two sizes of radial air-cooled engines, the 400 hp. "Wasp" and the 500 hp. "Hornet."

European Mills Face a Struggle For Foreign Markets in 1928

Decline of Home Demand May Make Germany Larger Exporter While Britain Seeks to Regain Lost Customers—France Must Retain Heavy Exports

Great Britain

ALTHOUGH still seeking some effective means of stemming the flow of Continental iron and steel into their domestic market and struggling to regain export markets lost during the coal strike, British producers look forward to 1928 with confidence that it will be better than last year. Among the proposed solutions to the British problem of meeting foreign competition at home and abroad are tariff protection, mergers and syndicates.

A YEAR ago the British iron and steel industry was slowly awakening from the lethargy ensuing from months of virtual idleness enforced by the coal strike. A number of blast furnaces had resumed operations, and order books for iron and steel generally were well filled as a result of a gradual accumulation of orders gathered during the period of inactivity. Makers were looking forward to some months of developing prosperity and on all sides the future was regarded with confidence.

Unfortunately few of these expectations were realized, and for the past six months makers have been struggling to keep their heads above water. The domestic demand has been of some assistance, but the volume of export trade has been of little consequence. The inevitable result of the coal strike last year was that a part of the business normally coming to British works was diverted to other channels, particularly to the Continent, and in addition to foreign producers gaining a foothold in markets which hitherto had been considered as British preserves, more than 4,000,000 tons of semi-finished and finished material was imported. In fact, a continuous stream of iron and steel products of all kinds entered Great Britain throughout the year. Faced with this serious situation, British producers naturally have urged "protection," and it is still being discussed in many quarters.

Efforts Made to Reduce Imports

Strong, but hitherto unsuccessful, efforts have been made to keep out foreign products, and representations have been made to Parliament for relief under the "Safeguarding of Industries Act." While the Government so far has been unwilling to act, it is by no means certain that this attitude may not be modified as increased pressure is brought to bear.

An influential group of the heavy steel makers has endeavored to stem the tide of imports and to encourage consumers to place their orders with domestic mills by granting them a rebate on a varying scale provided they fulfill certain obligations. However, the margin between the prices of British and foreign material is generally too great for the plan to be of much real assistance, although certain ship owners, swayed by patriotic rather than economic motives, have fallen into line and a number of new shipbuilding contracts have been booked. Railroad programs also have called for considerable quantities of material, but these do not compensate for the lack of export business, which is the mainstay of the industry.

A solution of the problem undoubtedly lies in a reduction of costs, but high wages, heavy taxation and burdensome overhead charges are serious obstacles. Another suggestion for restoring the industry to its former position lies in the direction of syndicates and mergers, with the attendant scrapping of high-cost units in favor of the more economical plants.

Competition of Foreign Iron Serious

The pig iron market has to a great extent suffered in a like manner. At the beginning of 1927 most furnaces had full order books and domestic users had closed heavy contracts for Continental pig iron, but once the sellers had cleared their books of the strike accumulation, they experienced much difficulty in securing new business. Throughout the year imports of pig iron were heavy, and for many months now the Scottish market, a very important outlet for Cleveland iron, has been virtually lost to the Middlesbrough furnaces.

Toward the end of the year the Cleveland producers evolved a plan of allowing a rebate of 2s. 6d. (61c.) per ton on sales for export and for Scotland, a decision which caused a great deal of dissatisfaction among other consumers and merchants. But this was only a preliminary to eliminating the Scottish merchant altogether, for at the end of November the Middlesbrough producers announced that in the future they would not sell iron to Scotland through merchants, but only through their own agency to be established in Glasgow. This agency is now operating, but whether or not it will be successful remains to be seen.

British Mills Watch International Cartel

British iron and steel makers have had a watchful eye on Continental developments, especially the operation of the International Steel Cartel and the efforts of Germany to secure the establishment of international sales offices for various materials. That the established offices for certain products have not worked very satisfactorily, however, is evidenced by the collapse during the autumn of the International Wire Syndicate, while the Pig Iron Syndicate, because of the abstention of the German furnaces, has never been more than a loose agreement.

An International Wire Rod Cartel was eventually set up and is now operating, but there is still one large group not included. Throughout the year efforts were made to establish a cartel for semi-finished products and beams, but as a result of the inability of the Belgian producers, and to some extent of the French also, to reach an agreement among themselves, no real progress was possible.

The present outlook in the British iron and steel trade is for better business in 1928 than in 1927, which indeed, was almost without exception one of the worst years financially ever experienced. Efforts will undoubtedly be made to curtail the volume of iron and steel imports, and British sellers will endeavor to reestablish themselves in certain foreign markets.

Germany

VIEWING the extraordinary activity of the most prosperous year since the war, German mills are inclined to believe that, despite the continued heavy domestic demand, the end of this period of prosperity is approaching. Should their domestic market in 1928 cease to be the great factor that it was in 1927, German producers are prepared to seek again a larger foreign trade.

THE past year was the most prosperous since the war, with general industry operating at maximum capacity and with the metal-consuming industries, including shipbuilding, machinery manufacture and building construction, unusually active. As a result of the extraordinarily heavy domestic demand for iron and steel, Germany temporarily became a large importer and a relatively smaller exporter. Throughout the year the blast furnaces and steel plants had orders booked for several months ahead, and unemployment in the metal-working branches of the labor unions declined from 16 per cent at the beginning of the year to about 4 per cent at the end.

Although coal production showed a slight decline during the year, the total output of coal probably exceeded the 1926 figure, with 114,400,000 metric tons mined in the first nine months compared with 104,600,000 tons in the same period of 1926. Export of coal at low prices was made possible by the profitable level of the domestic market, and competition with British sellers was severe, no progress having been made toward an international understanding.

Throughout the year the pig iron market was active, but in the second half, British competition began to be a factor in export sales. In exports of steel, the principal competition came from French and Belgian mills. In neither pig iron nor steel, however, did foreign competition affect the domestic market, but in the export field prices were made unprofitable and the limited tonnage of German steel that was available for shipment abroad was sold at much lower prices than prevailed at home. A system of rebates on material delivered by the steel syndicate to manufacturers converting for export was continued, the rebates increasing as the disparity between German and other Continental prices became greater.

Establishment of 8-Hr. Day Postponed

With the iron and steel industry so unusually active labor became restive and there was a slight increase in strikes, but the steel mills were unaffected. Wages advanced steadily, but on the whole remained rather low. On Oct. 1, the average weekly wage of skilled workers in the iron and steel industry was 47.97 m., about $11.40, and of unskilled labor, 33.31 m., about $8. At the blast furnaces the 8-hr. day was in effect, but the steel mills continued on the 10-hr. day. In July the Government decreed the 8-hr. day for steel plants, to be adopted by Jan. 1, 1928. Claiming that the time allowed was too short for the necessary reorganization, the mills threatened toward the end of the year to suspend operation unless the time limit was extended. This resulted in objections by labor, and, finally, only a few days before the new year, the Ministry of Labor, while making no change in the 8-hr. day order, decided to postpone the effective date, especially for steel mills not employing the basic Bessemer process. Under the ruling, mills are permitted to apply for extension of time, provided they can show that it is impossible for them to comply with the conditions immediately. Meanwhile, the ministry will carry out an extended survey of the industry, which will probably require several months, during which there will be progressive application of the 8-hr. decree.

Year of Heavy Production

Production in 1927 was in excess of 1926 output. Pig iron production in the first 10 months of 1927 was 10,833,463 metric tons as against 7,595,430 tons in the corresponding period of the previous year; steel ingot output was 13,537,954 metric tons as compared with 9,780,437 tons in 1926, and the production of rolled products was 10,687,093 tons as against 8,190,629 tons.

Prices of iron and steel in domestic markets changed but little. In the fall, pig iron quotations were reduced slightly, first as a result of competition from a German producer not a member of the pig iron syndicate and later because of competition from British iron. Apart from local price adjustments, the steel ingot price established by the Ingot Steel Syndicate at its foundation in 1925 was maintained without change.

One of the most active branches of the industry was iron mining, which had been severely depressed during 1926. The year saw a heavy demand for semi-finished material, bars, shapes, wire rods, wire and heavy and medium-gage sheets. Light-gage sheets were quiet and, as a result of sharp competition, prices later in the year developed a tendency toward weakness.

In foreign trade an export surplus was maintained, but it was considerably smaller than in 1926. During the first nine months of the year, imports of iron and steel totaled 2,070,359 metric tons, while exports were 3,489,001 tons, leaving an average monthly export surplus of 157,627 tons, compared with an average surplus in 1926 of 340,000 metric tons a month. The surplus of machinery exports over imports was more than maintained in 1927, with only 40,455 metric tons imported in nine months and 327,819 tons exported.

Domestic Mergers and New Cartels Numerous

During the year, mergers of large companies continued and additional cartels and syndicates were formed in Germany. In the formation of international cartels, however, little was accomplished. The inclusion of German pig iron producers in the Franco-Belgian Pig Iron Entente was proposed, but no action was taken. The International Steel Cartel was something of a disappointment to the German membership. As it had failed completely to maintain profitable prices, it was decided in the fall that separate selling syndicates should be established for all products which the international cartel controlled, and negotiations are still under way with moderate prospect of success. In furtherance of this plan for separate syndicates, an International Wire Rod Cartel was formed during the year, but it did not become effective until late in the fall.

Some of the dissatisfaction of German members with the International Steel Cartel probably came from the heavy penalties for overproduction, which Germany had to pay into the treasury of the cartel. The fine fixed at the time the cartel was established in 1926 was $4 per ton for all production in excess of the quota. In 1927 the cartel took into consideration the position of the German mills, which were being forced to overproduce to meet unusually heavy domestic demands, and for that part of the excess production consumed in the domestic market the fine was reduced to $2 and later to $1 per ton.

There have been several important company mergers, some of which were begun in 1926 but not completed until 1927. The Edelstahlwerke A. G. was established through a merger of producers of special quality steel, and two large corporations were established, one the Mitteldeutsche Stahlwerke, controlled by the Vereinigte Stahlwerke, the other the Oberschlesische Huettenwerke, a combination of Eastern companies. A close association, which is expected to develop into one or more corporations, was formed by 30 railroad car-building companies. Efforts to establish a thin-sheet syndicate failed, so that this product is the only important steel material with no association.

While preparatory investigations and hearings began for reduction of the present tariff in accordance with recommendations of the Geneva Economic Conference, it is understood that iron and steel duties will not be changed.

Prospects for business in iron and steel during the coming year are considered doubtful. At the end of 1927 steel works had orders sufficient to occupy them for a number of months, but there were distinct signs of a slackening of demand. Should the domestic market become less active as the year progresses, German competition for orders in the international market will undoubtedly increase proportionately.

France

FACED with excessive stocks held by consumers, a result of the heavy buying movement which developed during the unstable financial situation of 1926, *producers of iron and steel experienced a steadily declining market in* 1927 *until the closing months of the year. Greater exports aided in the maintenance of operations, but despite all efforts French producers were unable to reach the maximum of the quota allotted them by the International Steel Cartel.*

ALTHOUGH 1927 was a year of greater financial stability, the gradual rise of the franc, which began in the fall of 1926, brought a slackening of business. In the past year there have been occasional upward movements, but in most cases these have been of short duration. Confidence in the financial future of the country has been restored, and there is no longer a desire to turn money into raw materials or manufactured products. The sudden change in the financial situation, however, found both producers and consumers with heavy stocks of material as a result of the large purchases made in 1926, when actual material was a far safer investment than paper francs of indeterminate value.

For most of the year consumers have been able to satisfy their requirements from these large stocks, with only occasional small purchases, and it was not until early in October that there was a slight improvement in domestic demand, accompanied by more firmness in prices. Following this temporary recovery, purchasing declined again, but there is still considerable strength to prices, largely on account of the belief of producers that the cessation of buying was caused by the holiday period.

Year of Declining Prices

A comparison of domestic and export prices as of Dec. 1, 1926, and Dec. 1, 1927, shows a considerable decline in both in the intervening 12 months. In the domestic field phosphoric foundry iron receded from 587 fr. ($23.07) per metric ton to 420 fr. ($16.50) per metric ton, and hematite has dropped from 690 fr. ($27.12) to 535 fr. ($21.03) per ton. Thomas steel billets, which were quoted at 780 fr. ($30.65) per ton in December, 1926, declined to 485 fr. ($19.06) per ton in December, 1927. Merchant steel bars, which were 860 fr. per metric ton (1.53c. per lb.), reached 560 fr. per ton (1c. per lb.) in December, 1927. Other products show corresponding reductions.

Export prices also registered a decline in the 12 months. Phosphoric foundry iron, which was £4 5s. ($20.74) per ton, f.o.b. Antwerp, Dec. 1, 1926, was only £3 to £3 2s. ($14.64 to $15.13) Dec. 1, 1927. Thomas steel blooms dropped from £4 12s. 6d. ($22.57) to £3 17s. 6d. ($18.91) per ton, and billets from £5 4s. ($25.38) to £4 3s. 6d. ($20.37) per ton. Beams, which were £5 11s. 6d. to £5 12s. 6d. per ton (1.23c. to 1.24c. per lb.) in December, 1926, dropped to £4 7s. to £4 8s. 6d. per ton, (0.98c. to 0.99c. per lb.). Thomas steel bars declined from £5 12s. 6d. (1.23c. per lb.) to about £4 15s. per ton, (1.05c. per lb.). Even the low prices of Dec. 1, 1927, were not the minimum quotations of the year, the lowest levels in most products having been reached in October and early November, after which there was a slight recovery caused by increased buying preceding the holiday period.

Steel Cartel Only Partial Success

Despite its lack of anything like effective control over Continental market conditions, the International Steel Cartel, established Sept. 30, 1926, added several of the smaller producing countries in Europe to its membership in 1927, so that today it includes a good share of the steel industry of the Continent and its meetings attract wide attention. However, as an agency for controlling steel production and, indirectly, prices, it has given only partial satisfaction to its membership. Germany, to meet the demands of its domestic market, exceeded the cartel quota throughout the year and, as a consequence, was fined for output in excess of its allotment. French producers, on the other hand, were unable to reach the maximum quota allowed them, but even with reduced output, production was larger than demand.

As a solution there has been an effort to establish separate selling syndicates or ententes to control certain products. The European Rail Makers' Association, which was in existence prior to formation of the International Steel Syndicate, has apparently been funcioning reasonably well, and in October, following long negotiations, the International Wire Rod Cartel was formed. The most desirable of separate syndicates, however, would be agencies for handling semi-finished material, bars and beams, and with their formation in view numerous meetings were held during the year. There is a growing belief among producers that, unless they enter international selling syndicates, there is little prospect of stronger prices, especially for export.

Iron Ore Output Shows Increase

Production of iron and steel in 1927 is estimated to have been slightly smaller than in 1926. Ore output, however, is estimated to have been in excess of the 1926 output, with an estimated total production for the 12 months of about 43,700,000 metric tons, based on a monthly average of 3,649,000 tons for the first nine months of the year. The monthly average in 1926 was 3,213,000 tons.

Iron and Steel Production Smaller

During the year the number of blast furnaces in the country increased by three, to a total of 220. Based on an average monthly output of 773,700 metric tons, the total pig iron production for the 12 months is estimated at 9,300,000 tons, or slightly less than the 9,393,000 tons in 1926.

Steel ingot output is also estimated at slightly less than the 1926 total. On the basis of statistics for 10 months, the production for the entire year is estimated at 8,230,000 tons, compared with 8,380,000 tons in 1926.

Imports Smaller and Exports Increase

Imports of pig iron and ferroalloys were larger in 1927 than in 1926, 30,034 metric tons of pig iron having been received in the first 10 months as compared with 20,700 tons in the corresponding period in 1926, while receipts of ferroalloys were 24,554 tons and 18,486 tons respectively. Imports of rails were also larger than in the previous year, but receipts of steel ingots, semi-finished material, bars, hoops, sheets and wire rods all registered considerable declines.

Export tonnages were all larger than in 1926. A total of 715,219 tons of pig iron was exported, compared with 555,958 tons in 10 months of 1926. Shipments of pig iron to the United States were only 2976 tons in 10 months of 1927, compared with 22,493 tons in 1926. Exports of semi-finished material, beams and bars to the United States were slightly larger than in 1926. Of a total of 2,386,710 metric tons exported in 10 months, the United States received 36,362 tons. This compares with 31,782 tons shipped to the United States in the corresponding 10 months of 1926 out of total exports of 1,612,495 tons.

CARNEGIE LIBRARY OF ATLANTA

Business Analysis and Forecast

BY DR. LEWIS H. HANEY

DIRECTOR, NEW YORK UNIVERSITY BUREAU OF BUSINESS RESEARCH

Statistical Data Concerning the Chief Consuming Industries Indicate That:

Activity in chief consuming industries has been fairly well sustained, though spotty.

Car and locomotive buying in December made a large gain over recent stagnation.

Automobile production declined 20 per cent in November; general manufacturing in other lines fell off only 4 per cent.

Building volume continues large; industrial building is relatively small; structural sales have held up, making 1927 the best year, except for 1925.

Outlook for pipe in petroleum States should improve, as present activity is at about bottom; mining demand has not been good.

Iron and steel exports have helped out somewhat; imports are less than a year ago.

DEMAND has two aspects, namely, quantity and value. To be really strong, demand must involve large quantities and also a readiness on the part of buyers to pay a good price. This generalization is stated here for the reason that the only improvement in the demand for steel seems to lie in the quantity that consumers are willing to take, and on the whole the steel market is still a "buyers' market." We are on record as anticipating a stronger demand early in 1928, and still expect such a development. The rising trend in unfilled orders results from a continued fair volume of new business and a moderate production. Together with prospects of a general business improvement, they make an upturn in the steel business probable.

It must be recognized, however, that no real strength of a sustained character is to be expected in the steel markets until the business of the chief consuming industries picks up. Of this there is not yet much evidence. There has been a spurt in equipment buying and prospects for expansion in automobile production are quite definite, but that is about all. It is to be hoped meanwhile that the steel makers will not become too optimistic in anticipating expanded buying, for if they do they will continue to find the price side of demand unsatisfactory. (This observation seems pertinent, because of the upward trend of steel production in December.)

Production Adjusted to Steel Demand

OUR composite demand line, based on an estimate of the activity of the chief iron and steel consuming industries, declined in November to the lowest point since the latter part of 1924. This fact amply explains the slackening in the steel business in that month and the accompanying decline in production. Fortunately, however, it can again be stated that the production of steel ingots appears to have been amply adjusted to requirements. In other words, the production curve in the first chart lies well below the composite demand line. Indeed, there is some reason to believe that the actual buying of steel a few months ago was even less than the activity in the consuming industries would normally have required, and that in the last two months orders and sales have been better than the current activity in those industries would have indicated.

Declines of considerable magnitude occurred in railroad freight traffic, in manufacturing activity, and in the automobile industry in particular. General manufacturing, exluding the automobile industry, declined about 4 per cent more than usual in November, while the decline in the automobile industry was over 20 per cent. On the other hand, mining (including petroleum production) gained more than usual for the season, and machine tool orders showed an appreciable upward trend. Exports of iron and steel in November were up slightly more than usual.

Conditions in Particular Industries

The outlook for the near future is moderately encouraging. There has already been a good recovery in the buying of *railroad equipment*, which proves that the carriers had postponed some necessary purchases. It continues to seem highly probable that equipment buying will be better in 1928 than in 1927 and that a considerable gain will develop by spring, when railroad

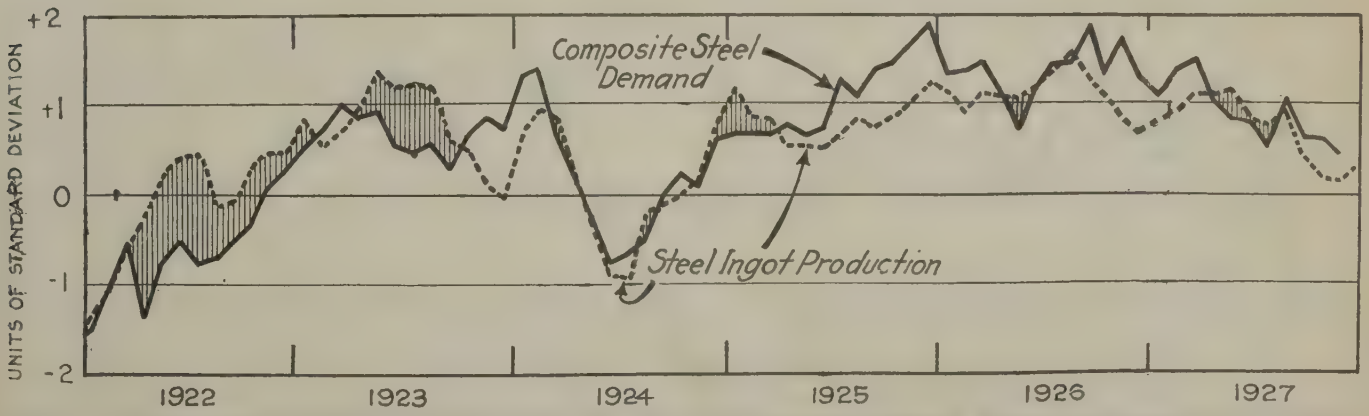


Fig. 1—Current Steel Production Is Still Below the Curve of Composite Demand, Which Has Fallen to the Lowest Point Since 1924. The outlook for the near future is moderately encouraging

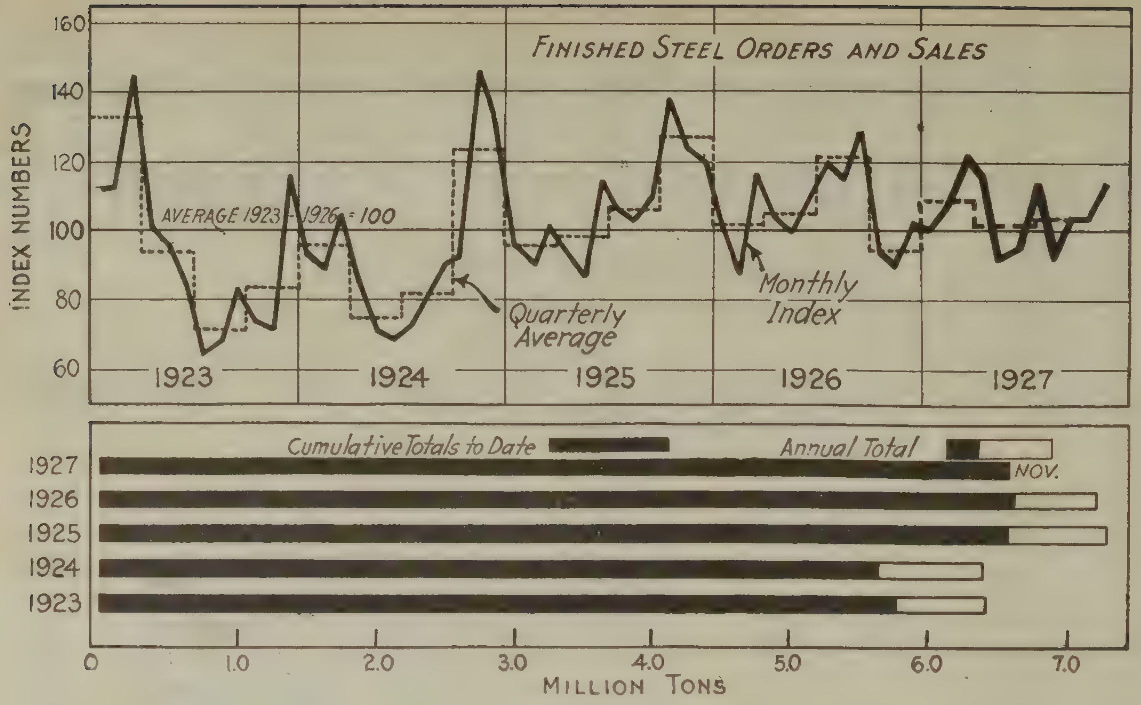

Fog. 2—For the First Time Since 1924 the Trend from August to December Has Been Upward in Sales of Finished Steel. The fourth quarter may equal the first

traffic should be on the up-grade. For the present, however, it is to be remembered that not only is traffic small and earnings much reduced (only 3.7 per cent annual rate on the investment in November), but that the surplus of equipment available is also rather large.

Building activity promises to continue in about normal volume. *Automobile* production is almost certain to expand considerably in the spring. Great sales effort and production programs are already in evidence and the recent wave of price cutting at least promises numerous sales. Probably the hopes of all automobile manufacturers cannot be realized and severe competition is almost a foregone conclusion. The prospect is for a large volume of automobile steel, but with a great pressure from the manufacturers for low prices.

General manufacturing (excluding the iron and steel and automobile industries) was sharply lower in November and will probably show a further decline in December. It has fallen below normal. In general, however, supplies of commodities are rather small and, as retail trade continues to show large consumer buying, and as our business barometers indicate improvement during the first half of the year, it seems that the steel industry should benefit.

Both the *mining and oil* industries appear to be fairly well stabilized but, as everyone knows, are in a depressed condition. Gradual improvement is to be expected in the oil and copper industries at least. The gasoline situation is fundamentally strong, but supplies of crude petroleum and fuel oil are so large that it will be the part of wisdom to restrict drilling operations for some time.

Agriculture continues to show moderate improvement and affords favorable prospects to the manufacturers of agricultural machinery and implements, which should mean continued good buying of steel from that quarter.

The expansion of steel production abroad makes it continue probable that *exports* will be irregular, and sustained only by making low prices. A continued good volume of foreign trade in automobiles and machinery, however, will help to sustain the demand from domestic manufacturers.

Orders and Sales May Have Exceeded 1926

SALES of finished steel made a rather good showing in the latter part of 1927—at least insofar as tons are concerned. A little study of the second chart will demonstrate that this is the first year since 1924 that the trend between August and December has been upward, or that it could be said that November orders were the largest since July. The upswing has not been nearly so sharp as in 1924—that could hardly be expected, in view of the well sustained volume during the past year—but it has nevertheless been clear-cut.

The December figure, of course, is still uncertain, but it seems possible that the orders and sales may show a further gain in that month and may even equal the March volume. In that event, the fourth quarter total may be as large as, or larger than, the first quarter. If so, that will constitute a very favorable indication. Reasons for moderate optimism concerning the December figures are found in current reports of large equipment orders and in a large gain in the unfilled orders for steel sheets. There is reason to suppose that increased business for car and locomotive

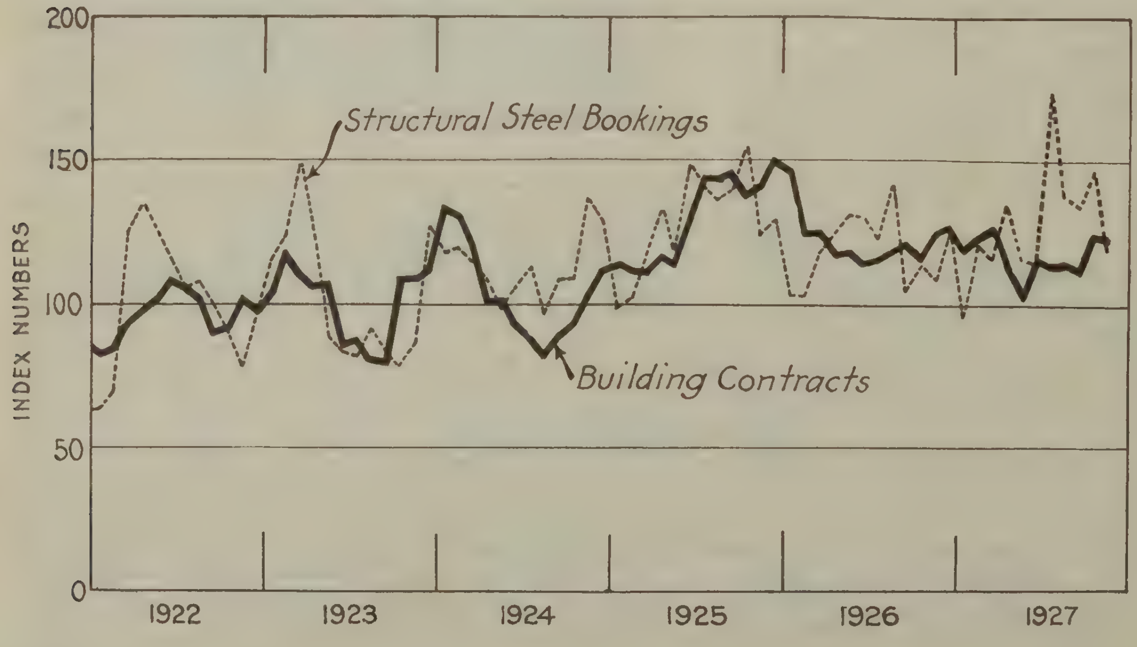

Fig. 3 — Building Contracts Showed a Seasonal Drop in December. Structural steel bookings show good volume and should resume a high level in the spring. The total for 1927 was the best except for 1925

manufacturers and expanded programs of automobile manufacturers will have been reflected in the December steel business. Coupled with a good volume of structural steel business in that month, these facts indicate a gain.

Production Has Been Moderated to Demand

It follows also that our estimate of orders and sales for the year 1927 may equal or even exceed the 1926 total. This would mean that the quantity of plates, steel castings, sheets and fabricated structural steel *sold* has been well sustained. It would also mean that, in view of the decreased ingot production, the stocks of steel have probably been reduced. It tends to confirm indications given by our composite demand line to the effect that the production of steel has been moderate in comparison with the demand.

November sheet sales increased and were the largest of any month of the year except March. The bookings of steel castings also gained but, though the tonnage was the largest since July, it still was rather small for the season. There is every preliminary indication of a further increase in December. Fabricated structural steel awards declined in November. Though considerably above a year ago, the 213,100 tons made a good showing. Judging by weekly trade reports, the official figures for December awards should show an appreciable increase. The poorest showing was made in the case of fabricated plates. It remains to be seen whether the spurt in equipment buying will be reflected in the December business in this line.

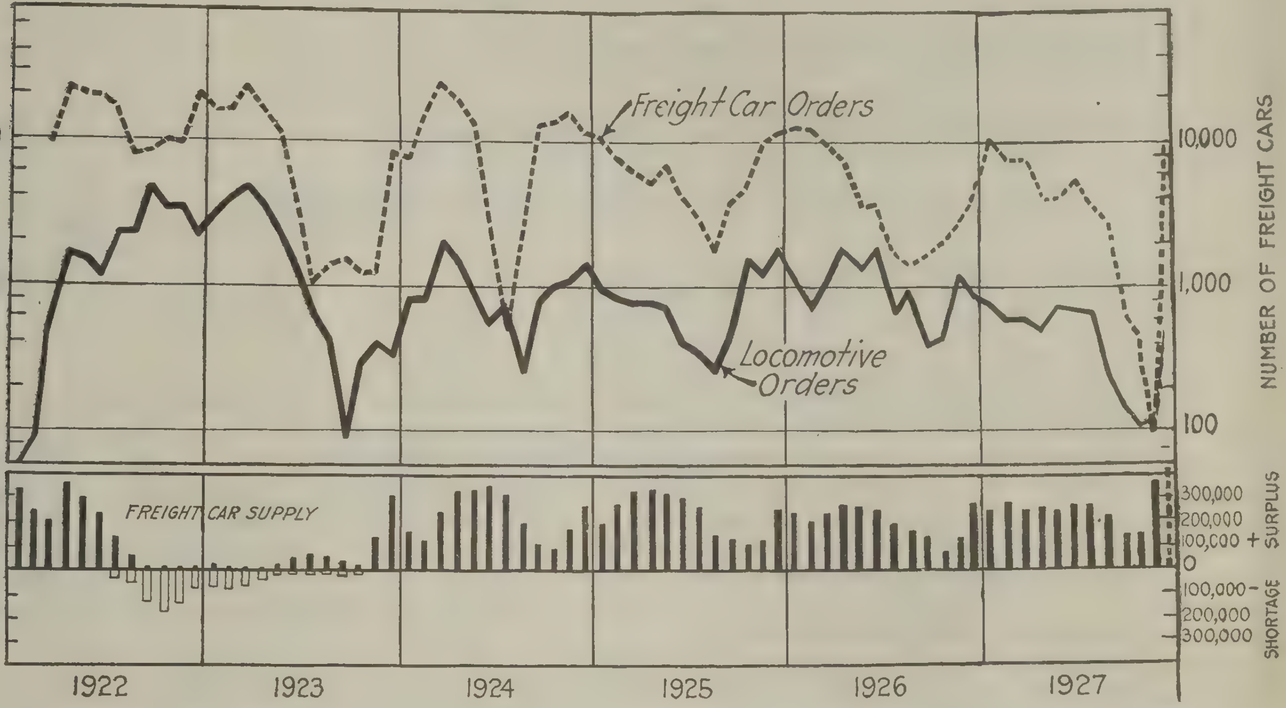

Fig. 4—Locomotive and Railroad Car Orders Gained Decidedly in December, as Forecast a Month Ago, with Consequent Betterment in Demand for Certain Steel Products

Construction Has Held Up Well

TWO curves, showing the trends of building contracts and the bookings of structural steel, as presented in the third chart, came together again in November. Once more the fundamental relation between the two sets of statistics is shown, and incidentally the fact that the two statistical series are fundamentally accurate is indicated.

December building figures showed a large decrease in speculative operations, particularly in residential building. Probably, however, the December drop was not much more than seasonal. A decrease of over 10 per cent in building contracts (floor space) is normal for December, and total contracts awarded last month were not that much below November. Our adjusted index is 125.6 per cent of the average for 1921-25, against 122.9 in November, and 127.4 a year ago. It is now certain that the year ended a little lower than did 1926 and, of course, much below the peak reached at the end of 1925, when the index was 150.4. The total volume of the year, however, may fairly be called good.

Large Structural Steel Sales

This showing for the year is due to the large volume of public works, bridges, roads and miscellaneous industrial construction. The situation is clearly illustrated in the unusually wide divergence of the structural bookings from the total building contracts awarded between June and November. Total structural steel sales in 1927 have been exceeded only in 1925.

The outlook for the first half of 1928 is good. Though some tightening of money rates is to be expected in the spring, the money markets are easy at present and are likely to continue so during January. The considerable let-up in speculative building during 1927 is likely to be followed by a more normal growth this year, especially as the outlook for agricultural sections seems good and the well-being of the general mass of the people is well sustained.

Car and Locomotive Orders Pick Up

AS shown in the fourth chart, orders for railroad equipment gained decidedly in December. Official figures indicate an increase in locomotive unfilled orders, in spite of larger shipments. It seems reasonable to infer that this development should bring greater strength to the market for plates.

McClintic Marshall Co. has started to erect the structural steel at the two new open-hearth furnaces to be constructed at the plant of the Wisconsin Steel Co., Chicago. These furnaces are to be known as Nos. 6 and 7.

This Issue in Brief

Better forgings produced by charging billets into cool furnaces. Charging into a hot furnace often produces internal ruptures. Locomotive builder varies soaking time and rate of temperature increase in accordance with cross-section of the material, keeping a detailed record of the heating cycle.—Page 127.

1927 was best year since 1920 for Canadian steel industry. And outlook for 1928 is promising. Steel output was 12 per cent above 1926, but pig iron production fell off 5.5 per cent, due principally to competition from United States.—Page 133.

Lamellar pearlite is not the normal condition of the eutectoid in slowly cooled plain carbon steels, says metallurgist. Declares text books are incorrect, and supports his contention by micrograhps. Spheroidized or massive pearlite may be produced in steels of any carbon content by proper anneals, he declares.—Page 134.

American machinery increasingly popular abroad. Exports for first 11 months show increase of 30 million dollars over same period of 1926, a gain of more than 8 per cent.—Page 177.

Abandon export steel business, urges American banker. This would help Europe recover and would make for international economic recovery, he declares. Steel exporter points out that Europe's export steel trade is progressing very nicely, even with the small share of business we are taking. The loss of this business, representing about 5 per cent of our output, might throw many Americans out of employment, and would increase our costs of manufacture.—Page 136.

Dr. Haney warns steel makers against over-optimism in anticipating expanded buying. Otherwise the price side of demand will continue to be unsatisfactory.—Page 143.

Anti-friction bearings, applied to railroad cars, show high resistance to impact. Nickel-molybdenum steel bearings withstand temperatures above the atmospheric without a rapid decline in elastic limit.—Page 131.

Price cuts in automobiles will result in great pressure being brought to bear by automobile manufacturers for low prices on raw materials, says Dr. Haney. The prospects are that along with considerable expansion in automotive industry by spring, will come severe competition and insistence on low prices.—Page 144.

End of their prosperity is approaching, German iron and steel makers believe. Heavy domestic demand gave the German iron and steel industry the most prosperous year since the war. They are prepared to seek again a larger foreign trade, when home sales lessen.—Page 141.

Cuts forging billets exact length required, and thereby reduces heating costs. By this practice, locomotive builder also reduces to a minimum the amount of waste crop ends and uncovers any hidden piping.—Page 128.

Finished steel sales show upward trend from August to December for first time since 1924. Sales made a rather good showing in latter part of 1927, says Dr. Haney, and fourth quarter may have been as large, even larger, than the first.—Page 144.

Will England be forced to abandon her free trade policy with regard to steel? English iron and steel industry has suffered heavily from imports, and is bringing strong pressure to bear on Parliament to provide "protection."—Page 140.

American exports of rolled and finished steel fell off 6 per cent in first 11 months as compared with 1926, while imports increased 1.5 per cent.—Page 175.

Sharp decline in pig iron imports. In first 11 months of 1926 we imported 430,990 gross tons. In the same period of 1927 only 118,769 tons came into the country.—Page 175.

More than a half million ton gain in Steel Corporation's unfilled orders. Total at Dec. 31 was 3,972,874 tons, highest since March, 1927. Increase in December of 518,430 tons was greatest monthly gain in three years.—Page 163.

Avoids tong scrap in making heavy forgings, by turning forging end for end. Manipulator moves and revolves the ingot or billet in the press, to the varied positions required. When one end is finished, the forging is placed on a turntable and the ends reversed.—Page 128.

Gain of 50 per cent in machine tool exports over 1926. Shipments for first 11 months of 1927 were valued at $9,897,000, as compared with $6,408,000 for same period of 1926.—Page 177.

Steel output increased 1.6 per cent in December. Average daily rate was 121,167 gross tons, as compared with 119,299 tons in November.—Page 167C.

Shall We Stop Steel Exports?

FOR inscrutable lack of Americanism, naive willingness to become almoner of the property and labors of others, and for fiscal and economic statesmanship well worthy to bear the label "made in Germany," commend us to the proposal that the United States retire in favor of Europe from the steel markets of the world. Here for years the policy of increasing our trade with foreign lands in all that we produce has been held up as patriotic and in all ways desirable. Administrations at Washington have come and gone; but whatever the party in power, there has been an unvarying pressure upon the country's consular agents in every quarter of the globe to exert themselves to the utmost to increase the use of American products to the largest possible extent. The American manufacturer, or his agent, as he has crossed oceans to cultivate trade relations with white men, black men, yellow men and brown men, in whatever country or clime, has had cooperation in any and all ways, of our Government's representatives abroad.

At Washington, all appropriations committees, whether under Democratic or Republican control, have vied with each other in making large outlays for the extension of the work of the Department of Commerce. Nothing has ever developed, in all these years of persistent effort to increase American exports, indicating that the expansion of the use of American steel in foreign countries was not an achievement ranking as high as any other in the campaign for a larger place for the products of American invention and labor in the lives of distant peoples. And men in the steel trade have not forgotten that back in 1915, when the United States Circuit Court of Appeals gave its decision at Trenton, refusing the Government's petition to dissolve the Steel Corporation, great stress was put by the court on the corporation's contention that the building up of an export trade in steel was one of the main reasons for forming a consolidation completely integrating all the materials and processes necessary for the manufacture of all forms of finished steel.

It need hardly be said that all the thinking of American men of business on this subject has been one way and that their pride in the building up of foreign markets for our steel products is just that which they have taken in every other advance of American trade in foreign lands. When they read recently that a New York banker had publicly advocated that our steel manufacturers retire from foreign steel markets, so that European steel companies might have undisputed possession, it was natural that a motive should be sought for so amazing a proposal. Certainly the reasons given, as reviewed in the article on another page, are far from adequate explanation—about as far from being adequate, indeed, as the statements concerning conditions in the American steel trade are from the actual facts.

Something more than $100,000,000 of securities of European steel companies have been marketed in the United States, far the larger part of the proceeds going to Germany. Is it seriously urged that the interests of these stockholders should outweigh those of the tens of thousands of American steel workers engaged in the production of export steel, or of the thousands of holders of stocks in companies which have built up our foreign trade in steel?

Do these workers and these holders of domestic steel securities agree that the European situation calls for such a policy of scuttle by the men whose high enterprise has won for American steel the favor in which it stands today in the markets of the world? If it is decided that this country should do more than it has already done in helping Europe, why ask a single industry to make the contribution? Let the whole people be generous together.

PANAMA Canal traffic has reached such volume, and shows such a steadily rising trend, that serious thought is being given to the probability that transisthmian carrying capacity will have to be increased in the near future. Whether this will take the form of an additional flight of locks at Panama, paralleling the dual flights now in use, is undecided. There are many who believe that in the interests of strategic safety an entirely new canal should be built, at a different location. Naturally, the Nicaragua route comes to mind, because it once was almost decided upon instead of that at Panama. And the United States Government has an option on that route. A far look ahead is called for. But no longer will the question of cost be paramount, for the Panama Canal, despite its enormous costs of construction, is now paying a good dividend.

Smaller Steel Companies Grow

IT may have been noticed that in the annual summaries of new construction published by THE IRON AGE the largest steel companies have been conspicuous by their almost complete absence from the lists of builders of new steel-making capacity. In the summary for 1927, which appeared a week ago, the largest new construction was by the Ford Motor Co., and not one of the six largest steel companies appeared at all. The case was not exceptional. A summary of the annual reports covering the nine post-war years shows that these six companies contributed scarcely more than 25 per cent of the total new construction for steel making, yet these six companies represent 85 per cent or more of the total steel production.

By no means should it be inferred that these large steel makers were backward in making improvements, for the case in general was quite otherwise. Their efforts were directed to refinements and economies through the improvement of existing plant, and there is no doubt that their actual ability to make steel was increased. The point is that, despite the large capacity that was left at the end of the war, the highly competitive condition and the heavy cost of construction, smaller companies have been able and have seen fit to grow.

Just as was the case for years after the Steel Corporation was formed twenty-seven years ago, when "the independents" grew apace, so in these recent years the smaller producers have been growing more rapidly than the larger producers.

According to our annual summaries, new construction of steel-making units in the nine years 1919 to 1927 inclusive gave new capacity capable of producing 5,105,000 gross tons in a year. A small portion of this was in open-hearth furnaces for steel castings, and there was also the United States Government construction at Charleston, W. Va. The total steel ingot capacity was approximately 5,000,000 tons. The largest companies contributed only the following:

Steel Corporation	650,000
Bethlehem	400,000
Inland	250,000
Republic	50,000
Total	1,350,000

Neither the Youngstown Sheet & Tube Co. nor the Jones & Laughlin Steel Corporation appeared at all. The six companies contributed about 27 per cent of the grand total. In 1922 there was some new construction by the Steel & Tube Co. of America, absorbed the following year by the Youngstown Sheet & Tube Co.

Conspicuous among contributors to the remaining 73 per cent was the Weirton Steel Co., which only began building its steel plant in 1919, but now has seven 100-ton and four 200-ton open-hearth furnaces, representing not far from one-fourth of all the post-war new construction there has been. Then there are the Ford Motor Co., with about 400,000 tons, Colorado Fuel & Iron Co., McKinney, Andrews, Lukens, Interstate, Mansfield, Otis, Wisconsin, Trumbull and others.

Moreover, the new construction by the larger companies was chiefly special in character. The Steel Corporation's new construction, but one-eighth of the total, was confined to Gary, Ind., and Fairfield, Ala. Bethlehem's was only at Sparrows Point.

We do not have here a case of the large growing larger. If they grow stronger it is due to their refinements and reductions in costs through getting greater outputs from existing units.

Poisons for Metal

LUCKY is the blast furnace operator who has not been blamed at some time or other for unsatisfactory steel made from his pig iron. Even though the sulphur and phosphorus were within the specification, something "poisoned" the metal beyond the ability of the open-hearth to cure. Nitrogen is often blamed, although it is possible that this gets into the steel from case-hardened scrap. With specifications for physical properties and surface finish becoming constantly more severe, the steel maker must turn his attention to both the pig iron and the scrap he uses. So much alloy steel is coming back to the furnaces from wrecked automobiles and scrapped war equipment that the "pick-up" of nickel, chromium and other elements is influencing the resulting steel.

This problem is not alone with the steel maker. The user of secondary metals in the non-ferrous industry is also facing it. His troubles range all the way from innocuous nickel in brass (picked up from nickel-plated articles), and from antimony getting into bearing bronzes from particles of babbitt to real poison like aluminum coming from various sources into bronze fittings for high-pressure service.

The word poison is used with some hesitation, despite its common colloquial use. Also W. A. Forbes, in the paper on the "Technical Problems of the Steel Industry," presented before the last American Iron and Steel Institute meeting, devoted some space to the properties of the ferrite grain and the action of certain unspecified "poisons." Nevertheless, the word should be used with caution, for it is impossible to range all the elements into categories, one of which would be called poisons and the other foods. As recalled recently in these columns, manganese has too long borne an undeserved reputation as an undesirable citizen. Furthermore, aluminum, while ruinous to steam-tight brasses, is a very useful foundry addition to other analyses frequently cast into plumbing fittings.

Such are the manifold and various ways in which metals and alloys are influenced that it is not surprising to note the trend in recent metallurgical research toward the production of large metallic crystals of extremest purity. Only by knowing what are the properties of each metal in its utmost simplicity can the effect of each additive element be measured. Eventually we may be able to predict when and how an alloying element is poisonous—that is to say, modifying the original properties for the worse—or a food, enabling the metal to grow stronger and better. Or it may be found that such prediction is possible only in certain rare instances. But the day when all such things are known is far distant. In the meantime much precise and painstaking work will be needed, taxing the best ability to perform and interpret. Furthermore, specifications must frequently be adjusted, as the supposed effect of certain elements or treatments is found to be wrongly appraised, either from over-emphasis or entire neglect.

Small Growth in Coal Tonnage

PRODUCTION of anthracite and bituminous coal in the United States last year was substantially the even amount of 600,000,000 net tons, and as closely as can be estimated stocks were the same at the end of the year as at the beginning. There was about 21,000,000 tons excess of exports over imports, so that the apparent consumption of coal in the United States, including coal coked, was about 580,000,000 tons. Consumption in 1926 was approximately 614,000,000 tons, so that there was a decrease of about 34,000,000 tons or 5 to 6 per cent. The decrease in production was about 9 per cent. As is well known, there were unusual exports in 1926 and some stocking in anticipation of the coal strike.

The decrease in coal consumption from 1926 to 1927 need not be dwelt upon, as that decrease was small and very close figuring is impossible. We have the long range comparison, which is accurate and measures important trends of progress in coal economy.

Last's year's total coal production of 600,000,000 net tons was exceeded in five preceding years—1917, 1918, 1920, 1923 and 1926. As early as 1910 production was 500,000,000 tons, and the average production in four years, 1910 to 1913 inclusive, was 520,000,000 tons. There is an increase of 1 per cent a year, over a period long enough to be indicative of the general trend. In the twenty years preceding, or from the quadrennium through 1893 to the quadrennium through 1913, there had been an annual average increment of 5.7 per cent.

In sharp contrast with this slowing down, almost to the vanishing point, in the increase in coal consumption, is the fact that the power requirements of the country have been rapidly increasing in these recent years.

It is not a case of water power making serious inroads upon coal consumption. Hydraulic power largely creates its market, and the present developed water power is only about 12,000,000 hp., or 21 per cent of the total primary power, with 5 or 6 per cent being internal combustion power and the remainder steam, out of a total of about 57,000,000 hp. of primary power, excluding steam railroads, as ascertained by the Federal Power Commission.

The almost stationary volume of coal production, with steadily increasing service obtained from coal, in power generation, metallurgical and other operations and in heating of buildings of all sorts, is representative of steady and important improvement in methods of utilization. This will continue, both because much utilization is still far below the best standard, and because from year to year the best standards are improved.

The futility of expecting growth in coal demand to do anything at all toward righting the miserable situation that exists as to the production and marketing of coal is obvious. The best mines will in fact increase in tonnage. The solution has yet to be found. There is no economic barrier of the public being unable to pay higher prices for coal. A ton of coal renders so much more service than formerly that its intrinsic value is increased. We have it, in fact, that coal can be produced more cheaply than at present, when mine operation is so irregular, and the public is well able to pay more money for coal. Thus there is ample latitude for the solution of a problem which accumulating years of experience suggest is incapable of solving itself.

Hazards of Employee Stock Ownership

OWNERSHIP by 800,000 American employees of a billion dollars worth of their companies' securities, an average of $1,250 per employee stockholder, may carry with it occasional instances of hazardous investment, in the opinion of the National Industrial Conference Board, which has made a study of employee stock purchase plans. For this reason some corporations have avoided responsibility by distributing their employees' investments in the securities of a group of companies, instead of putting all the eggs in one basket.

The chief benefit from the sale of stock to employees, the report states, lies in promoting the habit of saving. This is more important even than the direct influence which stock ownership may exert on the employee's interest in the company's affairs and his attitude toward the management. The purchase of stock helps wage earners to provide against old age, it aids them in acquiring an independent source of income during the active years of their earning capacity. The feeling of security obtained through such savings, many employers reported, definitely reflects itself in the quality of their products.

As to hazards of investing in industrial securities, where such investments represent life savings, the report states that certain risks in employee stock purchase plans are found to exist, particularly those due to general fluctuations in the securities market, although a few companies have taken measures to protect employee stockholders against declines in the market price. There is also always the chance of the employing company's business declining, in which case the employee's stock likewise may fall in market value and yield.

It is to overcome this latter risk, the board finds, that some companies have devised plans under which employees may buy securities of various other companies as well as their own, thus diversifying the investment so that it will not be wholly dependent upon the fortunes of the employing company. Such plans, in some instances, have resulted in heavy stock purchases during recent years.

Securities of certain industries, where the product is not a staple need and the demand is subject to sharp fluctuations, may be subject to considerable risk. For instance, textile mills that specialize on certain kinds of dress goods may be thrown into idleness by a whim of fashion, as has happened in more than one case in the past few years. In other industries the buying of raw materials involves a speculative factor because of rapid declines or advances in prices. But in industries where no violently disturbing element beyond a change in the degree of national prosperity is to be feared, and where management is capable, no employee need fear that his savings are not wisely and safely invested.

CORRESPONDENCE

Ethics of Engineering Contracting

To the Editor: There is a growing tendency on the part of most buyers to violate what engineering contracting companies have termed the "buyers' code of ethics." This has become particularly acute in the last 10 years, or, in other words, since the war.

In placing large contracts, involving considerable engineering and manufacturing skill, the procedure usually is as follows:

The purchaser, having only a meager idea of what is necessary to meet his requirements, first submits his problem to several of the engineering contracting companies in a brief specification, outlining in general terms what the machinery is to accomplish and asking that recommendations and bids be submitted accompanied by complete specifications with drawings in sufficient detail to show what is proposed.

The very best talent is required to design the required machinery, draw the specifications and make proposal drawings detailed sufficiently so that bids may be compared and analyzed.

Conferences between the bidders and the purchaser are usually held both preceding and following such bids, at which ideas are exchanged, but always at the expense of the bidders.

When all bids are received and analyzed the purchaser discovers that there is one, or perhaps two, unusual and outstanding designs which fully meet the requirements, while the others are ordinary and not worth considering. The prices for the unusual designs, however, are higher per pound than the prices for the ordinary and worthless; so the purchaser selects the unusual design, but rejects the bids.

New inquiries incorporating the unusual design and specifications thus appropriated are then submitted to builders of this class of machinery and also to "jobbing manufacturers" not capable or qualified to submit a design and proposition on the original inquiry. This enables the jobbing manufacturer with a small shop, with no engineering staff overhead, and who has nothing to contribute to the general fund of engineering, to underbid the reputable engineering contractors, with the result that the purchaser then either offers the business to one or more of the experienced builders *at the low price*, or, rather than pay more than the lowest pound price, actually places the contract with the inexperienced and improperly manned shop. In the latter case the final result is usually a loss to the inexperienced jobbing shop and the delivery of unsatisfactory equipment to the purchaser, all of which would have been avoided if the contract had been placed with a reputable builder at a fair price.

This method of buying, in the long run, is also harmful to the buyer. It eliminates competition by weakening the leading firms, which, in most cases, are substantial buyers of the products of the purchaser. It kills the initiative of leaders in improving designs, and makes it impossible for engineering contracting firms subjected to such unfair competition to carry the necessary staff of trained engineers to develop new lines. In other words, if pound price is the ultimate determining factor in purchasing, what advantage is there in offering specially designed and more efficient equipment?

It is possible for a builder to copyright his drawings, but this is rather impracticable. He can cover special features by patents. However, unless such patents are basic, they are of little value and often mean endless litigation with its attending expense and the time of busy men whose efforts would otherwise be used on productive work.

These unfair buying practices, if continued, will force engineering contracting firms to become jobbing shops and will compel buyers to do their own engineering development, for which they are unfitted. In the first place, their efforts in this age of specializing and sharp competition should be centered on their products and their markets. They do not have the benefit of interchange of ideas which the engineering contractor obtains in solving similar problems for others, and consequently they are likely to make many experimental installations which, unknown to them, have already been proved to be failures.

Wouldn't it be much better economically for all if the process of evolution were left in the hands of the engineering contractors with an assured fair reward for their services when they solve unusual problems and submit outstanding designs with their original bids, rather than to appropriate such designs without recompense and use them as clubs against their originators?

ENGINEERING CONTRACTOR.

British Iron and Steel Companies Having Hard Sledding

Financial statements for the past several years, covering six of the leading iron and steel manufacturing companies of Great Britain, are listed in a recent number of *Economist* (London). Only one company of the six has paid any dividends on common stock in the past three years. In the case of that one, the rate was reduced from 10 per cent to 5, and even then it was paid out of surplus in one year. Some of the individual results follow:

> Bolckow-Vaughan & Co. have run in "red ink" for the past six years. During that period they have not paid any dividends on common stock. During the three latest years they have paid no preferred dividends and the last year preferred dividends were paid, they were cut in half.
>
> Dorman, Long & Co. have paid no common dividends in three years. During one of those years they ran a heavy deficit, while only one year of the three provided any surplus whatever after paying interest charges.
>
> Cargo Fleet Iron Co. has paid no dividends in six years. The last two years have shown deficits after providing for interest and other charges.
>
> South Durham Steel & Iron Co. showed an operating deficit in one of the last three years, while another year gave a deficit after interest and other charges were paid. This company has not suspended common dividends, but cut them in half two years ago.
>
> Baldwin's, Ltd., has paid no common dividends in six years and no preferred dividends in the last two years. Manufacturing operations have yielded a profit, but not enough to take care of interest, depreciation, etc. As a result, two of the last three years have shown a heavy drain on surplus, while the other year showed only a small addition to it.
>
> United Steel Companies, Ltd., has paid no common dividends in six years and no preferred dividends in five years. The last year of preferred dividends showed a heavy cut in the rate. The last three operating years have shown heavy drafts on surplus, after paying interest and other charges.

Iron and Steel Markets

Further Gain in Steel Output

Sustained Railroad Buying and Heavy Awards of Concrete Bars and Structural Steel Feature Week—Mills Face Price Test on Automobile Steel

STEEL mill operations have shown a further gain, reflecting the recent bulge in specifications against fourth quarter contracts. Steel ingot production in Pittsburgh and nearby districts has risen to 75 per cent of capacity, or almost 15 points above the low point of last month. The Steel Corporation has lighted two blast furnaces in the Valleys and has added the second in two weeks at Chicago.

Sheet manufacturers have fully 900,000 tons of unfilled business, with independent mill operations averaging close to 90 per cent of capacity. Substantial increases have been registered also in the schedules of mills producing hot-rolled bars, cold-finished bars and strip steel. At Chicago, rail output averages 80 per cent. Production of tin plate and pipe, however, is showing relatively little improvement.

Comfortably filled order books and heavier mill engagement do not offset the fact that present commitments are at prices below those now quoted. Apart from sheets and strip, for which specifications at fourth quarter contract prices are still being accepted, the bulk of specifying has been completed, and current activity is limited chiefly to shipping instructions.

Little fresh buying has developed, but it is recognized that mill quotations face a real test as a result of efforts of the automotive industry to shift the burden of recent concessions in motor car prices.

Encouraging developments are a continuation of railroad equipment buying, further rail purchases, large placements of fabricated steel and concrete bars and increased activity of farm implement manufacturers.

In fact, good-sized railroad purchases, together with the first quarter instalment on large tin plate contracts, help to explain the gain of 518,430 tons in the Steel Corporation's unfilled orders in December. Rollings against the rails bought will be spread over a period of several months. It is significant that the gain in unfilled tonnage is the largest since that of December, 1924, which was 785,000 tons.

Railroad equipment orders for the week call for 1800 cars, of which the Texas & Pacific bought 1000 and the Southern 500, bringing the latter's total up to 5950, including those ordered in December. The Central of Georgia and the Union Pacific have each inquired for 500 cars. The Rock Island and Illinois Central are expected to come into the market for about 3000 cars each.

Rail purchases include 13,800 tons by the Cotton Belt and 10,000 tons by the Western Pacific, with about 100,000 tons yet to be placed by various Western roads, not all of which have issued definite inquiries.

The Pennsylvania Railroad has inquired for its first quarter steel requirements amounting to 25,000 tons of plates, 8000 tons of bars, 2000 tons of shapes and smaller lots of other products.

Structural steel awards total 44,500 tons, inclusive of 9000 tons of shields for the Fulton Street tunnel, New York, while fresh inquiries aggregate 45,500 tons, of which 8000 tons is for a building in Chicago and 7800 tons for New York subway construction. The Fulton Street tunnel also calls for 54,000 tons of cast iron segments, awarded to two companies, and 2000 tons of special bolts.

Reinforcing steel awards of more than 21,000 tons include two projects of unusual size, the Coyote Point bridge across San Francisco Bay, calling for 8500 tons, and a viaduct in Cincinnati, 3500 tons.

Pig iron shipments are increasing in the Detroit district because of demands from foundries engaged in automobile work. The week's buying included 25,000 tons at Cleveland, 15,000 tons at Philadelphia and upward of 12,000 tons at St. Louis.

Small sales of malleable iron in the Valley district brought that grade down 25c. a ton, but a stiffening tendency in prices is noted in some other districts, particularly in eastern Pennsylvania, where an advance of 50c. on foundry grades has been announced, and at Cleveland, where recent large sales have lessened the efforts of Lake furnaces to sell in competitive markets. Buffalo iron is at a minimum of $16.50 in New England and adjacent districts.

Production of steel ingots in December, at 3,150,345 tons, or 121,167 tons a day, showed a gain of 1.6 per cent over the November output of 3,101,764 tons, or 119,299 tons daily. In December, 1926, average daily production was 133,337 tons and the peak rate of 1927, in March, was 166,663 tons.

A new price schedule on 12 to 24-in. hot-rolled strip in No. 12 gage and heavier has been adopted by some mills in an effort to equalize quotations with those on two keenly competitive products, blue annealed sheets and light plates. The new prices are based according to gage on prices of 1.80c. on plates and 2.10c. on blue annealed sheets. A concurrent move was an advance of $1 a ton in the prices of strip not covered by the schedule.

A price of $33, mill, on sheet bars, or a reduction of $1 a ton, has appeared at Cleveland, and as low as $32 has been reported in the Valleys.

THE IRON AGE pig iron composite price has advanced to $17.59 a ton, from $17.54 of the past four weeks, its low of recent years. The finished steel composite remains for a fourth week at 2.314c. a lb.

*The average switching charge for delivery to foundries in the Chicago district is 61c. per ton.

On export business there are frequent variations from the above prices. Also, in domestic business, there is at times a range of prices on various products, as shown in our market reports on other pages.

Pittsburgh

Larger Orders and Operations in Steel Industry Offset by Unsatisfactory Price Situation

PITTSBURGH, Jan. 10.—Relatively full order books in most finished steel products and a substantial increase in rolling mill and steel works operations do not offset the facts that the orders and operations are based on low prices and that the efforts to establish a more profitable price level have not been particularly successful. While manufacturers are cheerful about the volume of business, they find it rather difficult to become optimistic over prices, especially as one of the results of the automobile price war has been a demand from motor car companies for help in carrying on the struggle. The steel industry faces a severe test on prices, for if it yields to the demands of the automotive industry, prices to other consuming industries cannot be well maintained.

Makers of hot rolled strips are making an effort to stiffen prices and some have actually come out with an advance. The year is too young for the low-priced business entered late last year to be worked out and the advances made in the closing weeks of the old year are yet to become fully effective. It was supposed that 4c., base, for automobile body sheets had represented a minimum based on costs, but in the week there have been reports of concessions of as much as $2 a ton, and the formal first quarter prices on common finishes remain an objective rather than an actual basis.

Steel ingot production in Pittsburgh and nearby districts has risen nearly to 75 per cent of capacity, or almost 15 points above the low point of last month. There is almost a full operation of independent sheet mills, although it is commented upon that the current demands do not call for an operation of much more than 75 per cent. Bar mill schedules have come up in remarkable fashion, in keeping with the fact that makers of cold-finished bars are running some 15 to 20 per cent better than in December, which in turn showed an appreciable gain over the months before. Strip mill operations also have grown substantially. Tin plate and pipe mills, however, are limbering up rather slowly. The Carnegie Steel Co. has put on two furnaces in the Valley districts and now has 24 of its 51 furnaces in blast.

Pig iron is slow both in point of demand and shipments, since the melt of the foundries has not increased much. Scrap prices have weakened again, as they usually do after buyers cover and withdraw from the market. The interesting event of the week in fuel is the posting of a new wage scale by the Pittsburgh Coal Co., which reduces the pay to most of the company's workmen. Wage scales in the coal mines in this part of the country have become largely individual and the adjustment just announced by the Pittsburgh company is based on its own scale rather than upon the wages paid by other operators.

Pig Iron.—Except for some activity in malleable iron, which has developed a drop of 25c. per ton in the price, the local market has been devoid of feature. The melt of foundry iron is not heavy, and as the larger consumers are covered at least through the present quarter of the year, shipments as well as sales suffer. Producers still are making an effort to get $17.50, Valley furnace, for No. 2 foundry and in a few instances they have obtained that price, at points where the freight from the furnace is low. In the Pittsburgh district proper, however, $17.25, Valley furnaces, appears to be all that can be got. A few single carloads of malleable iron have been sold in the past week at $17.50, Valley furnace, but on the worth-while tonnages makers have not been able to do better than the price of No. 2 foundry, with which malleable grade for some time was alined. The market for malleable iron here is a limited one and consumers often have a chance to buy iron grading close to malleable analysis at less than the price of standard iron. There is no open market activity in basic iron and little in Bessemer.

Prices per gross ton, f.o.b. Valley furnace:

Basic	$17.00
Bessemer	17.50
Gray forge	16.75
No. 2 foundry	17.25
No. 3 foundry	16.75
Malleable	$17.25 to 17.50
Low phosphorus, copper free	27.00

Freight rate to the Pittsburgh or Cleveland district, $1.76.

Ferroalloys.—A few steel makers have not contracted for supplies for this half of the year, but most of them are covered. Some have sufficient stocks to carry through the first quarter. There is a fairly good movement of ferrosilicon and spiegeleisen on contracts.

Semi-Finished Steel.—Open market activity is limited, but heavier operations of sheet, tin plate and strip mills are reflected in larger demands by non-integrated manufacturers. Prices of billets, slabs and sheet bars are unchanged. The regular quotation on wire rods is $42, base Pittsburgh or Cleveland, but large users are so well covered at lower prices that only occasional small sales are being made at the higher figure. Skelp prices are no more than steady at 1.80c.

Wire Products.—All makers in this area are quoting nails at $2.55, base, per keg, Pittsburgh or Cleveland, plus the card of extras adopted as of Dec. 1 last. First quarter contracts, which have been numerous, carry that price, but so far as current shipments are concerned there are few, if any, except at the old base prices and the old card of extras. Jobbers have so heavily augmented their stocks that there must be a considerable movement into consuming channels before the mills can hope to benefit much from the new schedule. There is only moderate activity in other wire products, but some betterment is noted in spring wire as automobile builders increase their production schedules.

Rails and Track Supplies.—Winter track-laying has not been as extensive this year as last and there is not as much ordering of spikes, tie plates and track bolts as at this time last year. Light-section rails are slow, but prices are firmly held as they are on other products under this heading.

Tubular Goods.—There is no sign of a revival in demand from the oil industry, and, except in the sections of the country favored by mild weather, no appreciable gain in the demand for standard-weight pipe. Mills have not recently added much pipe line business, but several of them have fair-sized backlogs in this product. A Youngstown mill last week started shipments on an order for 30,000 tons of 10-in. pipe for a line from Mexia, Tex., to Healdton, Okla., for the Sinclair Pipe Line Co. Boiler tubes and mechanical tubing are only moderately active.

Sheets.—Order books of makers, already heavy as result of the sales of last month, have been further swelled in the past week by some good-sized orders from automobile body builders. This business, however, is largely in releases on orders placed some time ago, when the price receded to 4c., base Pittsburgh. Ideas entertained by makers that they might be able to negotiate first quarter contracts at a higher price have vanished in the past week and body sheets, at least for this quarter, are not now considered likely to be any higher; indeed, there are reports that even that price has been shaded to the extent of $1 to $2 a ton. Estimates that sheet steel manufacturers were starting the new year with 1,000,000 tons of unfilled business are regarded as too high by some producers, but it is noted that many of the independent mills are operating full and independent mills as a whole are averaging close to 90 per cent. The American Sheet & Tin Plate Co. has not yet reached a 70 per cent operation of its sheet mills.

Tin Plate.—Mill operations are gaining momentum, but it is a gradual process and 75 per cent is probably a liberal estimate of the present gait. It was much higher a year ago, but there is not the tendency to produce in advance of specifications now.

Cold-Finished Steel Bars and Shafting.—There is a good movement of screw stock on contracts carrying prices $2 a ton below those now quoted. While makers encountered some resistance in securing first quarter commitments at 2.20c., base, they appear to have been successful in maintaining that price and in securing a full complement of such business.

Cold-Rolled Strips.—Business is better, but prices are simply steady, as there was a little too much coverage during December for makers to make a successful stand for an advance at this juncture.

Fluorspar.—Domestic gravel fluorspar now is freely available at $15 per net ton at mines, or $20.25, delivered Pittsburgh, Youngstown and Buffalo. Producers who have been naming higher prices have gone to $15, and it develops that on some recent business of size even that price was shaded by 50c. per ton. In their argument for an increase in the import duty on foreign spar, domestic producers placed their costs several dollars a ton higher than the prices some of them have accepted lately.

THE IRON AGE Composite Prices

Finished Steel

Jan. 10, 1928, 2.314c. a Lb.

One week ago	2.314c.
One month ago	2.307c.
One year ago	2.439c.
10-year pre-war average	1.689c.

Based on steel bars, beams, tank plates, plain wire, open-hearth rails, black pipe and black sheets. These products constitute 86 per cent of the United States output of finished steel.

	High		Low	
1927	2.453c.,	Jan. 4;	2.293c.,	Oct. 25
1926	2.453c.,	Jan. 5;	2.403c.,	May 18
1925	2.560c.,	Jan. 6;	2.396c.,	Aug. 18
1924	2.789c.,	Jan. 15;	2.460c.,	Oct. 14
1923	2.824c.,	Apr. 24;	2.446c.,	Jan. 2

Pig Iron

Jan. 10, 1928, $17.59 a Gross Ton

One week ago	$17.54
One month ago	17.54
One year ago	19.39
10-year pre-war average	15.72

Based on average of basic iron at Valley furnace and foundry irons at Chicago, Philadelphia, Buffalo, Valley and Birmingham.

	High		Low	
1927	$19.71,	Jan. 4;	$17.54,	Nov. 1
1926	21.54,	Jan. 5;	19.46,	July 13
1925	22.50,	Jan. 13;	18.96,	July 7
1924	22.88,	Feb. 26;	19.21,	Nov. 3
1923	30.86,	Mar. 20;	20.77,	Nov. 20

Mill Prices of Finished Iron and Steel Products

Iron and Steel Bars

Soft Steel	*Base Per Lb.*
F.o.b. Pittsburgh mills	1.80c.

Hot-Rolled Flats (Hoops, Bands and Strips)

	Base Per Lb.
All gages, 2 in. and narrower, P'gh,	2.10c. to 2.20c.
All gages, wider than 2 in., to 6 in., P'gh,	2.00c. to 2.10c.
*All gages, 6 in. and wider, P'gh	1.80c. to 1.90c.
All gages, narrower than 6 in., Chicago	2.40c.
All gages, 6 in. and wider, Chicago,	2.20c. to 2.40c.

---

*Mills follow plate or sheet prices according to gage on wider than 14 in.

Cold-Finished Steel

	Base Per Lb.
Bars, f.o.b. Pittsburgh mills	2.20c.
Bars, f.o.b. Chicago	2.20c.
Bars, Cleveland	2.25c.
Shafting, ground, f.o.b. mill	*2.35c. to 2.80c.
Strips, under 12 in., 1 up to 3 tons, P'gh,	3.00c. to 3.15c.
Strips, under 12 in., 1 up to 3 tons, Cleveland	3.00c. to 3.15c.
Strips, under 12 in., 1 up to 3 tons, del'd Chicago	3.20c. to 3.45c.
Strips, under 12 in., 1 up to 3 tons, Worcester	3.25c. to 3.40c.

---

*According to size.

Wire Products

(To jobbers in car lots, f.o.b. Pittsburgh and Cleveland)

	Base Per Keg
Wire nails	$2.55
Galvanized nails	4.55
Galvanized staples	3.25
Polished staples	3.00
Cement coated nails	2.55
	Base Per 100 *Lb.*
Bright plain wire, No. 9 gage	$2.40
Annealed fence wire	2.55
Spring wire	3.40
Galv'd wire, No. 9	3.00
Barbed wire, galv'd	$3.20 to 3.25
Barbed wire, painted	2.95 to 3.00

Chicago district mill and delivered Chicago prices are $1 per ton above the foregoing. Birmingham mill prices $3 a ton higher; Worcester, Mass., (wire) mill $3 a ton higher on production of that plant; Duluth, Minn., mill $2 a ton higher; Anderson, Ind., $1 higher.

Woven Wire Fence	*Base to Retailers Per Net Ton*
F.o.b. Pittsburgh	$65.00
F.o.b. Cleveland	65.00
F.o.b. Anderson, Ind.	66.00
F.o.b. Chicago district mills	67.00
F.o.b. Duluth	68.00
F.o.b. Birmingham	68.00

Sheets

Blue Annealed	*Base Per Lb.*

Tin Mill Black Plate	
No. 28, f.o.b. Pittsburgh	2.90c. to 3.00c.
No. 28, f.o.b. Chicago dist. mill	3.00c. to 3.10c.
Automobile Body Sheets	
No 20, f.o.b. Pittsburgh	4.00c.
Long Ternes	
No. 24, 8-lb. coating, f.o.b. mill primes	4.10c.

Tin Plate

	Per Base Box
Standard cokes, f.o.b. P'gh district mills	$5.25
Standard cokes, f.o.b. Gary and Elwood, Ind.	5.35

Terne Plate

(*F.o.b. Morgantown or Pittsburgh*)

(Per package, 20 x 28 in.)

8-lb. coating I.C.	$11.40	25-lb. coating I.C.	$17.30
15-lb. coating I.C.	14.45	30-lb. coating I.C.	18.75
20-lb. coating I.C.	15.80	40-lb. coating I.C.	20.85

Alloy Steel Bars

(F.o.b. Pittsburgh, Chicago or Ohio Mill)

S. A. E. Series Numbers		*Base Per* 100 *Lb.*
2100*	(½% Nickel, 0.10% to 0.20% Carbon)	$2.90 to $3.00
2300	(3½% Nickel)	4.00 to 4.10
2500	(5% Nickel)	5.00 to 5.25
3100	(Nickel Chromium)	3.00 to 3.10
3200	(Nickel Chromium)	4.75 to 5.00
3300	(Nickel Chromium)	6.75 to 7.00
3400	(Nickel Chromium)	6.00 to 6.25
5100	(Chromium Steel)	3.00 to 3.10
5200*	(Chromium Steel)	7.00 to 7.50
6100	(Chrom. Vanadium bars)	4.00 to 4.15
6100	(Chrom. Vanad. spring steel)	3.50 to 3.75
9250	(Silicon Manganese spring steel)	3.00 to 3.15
Carbon Vanadium (0.45% to 0.55% Carbon, 0.15% Vanad.)		4.10 to 4.20
Nickel Chrome Vanadium (0.60 Nickel, 0.50 Chrom., 0.15 Vanad.)		4.05 to 4.20
Chromium Molybdenum bars (0.80—1.10 Chrom., 0.25—0.40 Molyb.)		4.00 to 4.25
Chromium Molybdenum bars (0.50—0.70 Chrom., 0.15—0.25 Molyb.)		3.05 to 3.10
Chromium Molybdenum spring steel (1 — 1.25 Chrom., 0.30 — 0.50 Molybdenum)		4.50 to 4.75

Above prices are for hot-rolled steel bars, forging quality. The ordinary differential for cold-drawn bars is 1c. per lb. higher. For billets 4 x 4 to 10 x 10 in. the price for a gross ton is the net price for bars of the same analysis. For billets under 4 x 4 in. down to and including 2½ in. squares, the price is $5 a gross ton above the 4 x 4 billet price.

---

*Not S. A. E. specification, but numbered by manufacturers to conform to S. A. E. system.

Rails

	Per Gross Ton
Standard, f.o.b. mill	$43.00
Light (from billets), f.o.b. mill	36.00
Light (from rail steel), f.o.b. mill	34.00
Light (from billets), f.o.b. Ch'go mill	36.00

Track Equipment

	Base Per 100 *Lb.*
Spikes, 9/16 in. and larger	$2.80
Spikes, ½ in. and smaller	$2.75 to 2.80
Spikes, boat and barge	3.10
Tie plates, steel	2.25
Angle, bars	2.75
Track bolts, to steam railroads	3.80 to 4.00
Track bolts, to jobbers, all sizes, per 100 count,	70 per cent off list

Welded Pipe

Base Discounts, f.o.b. Pittsburgh District and Lorain, Ohio, Mills

Steel			*Iron*		
Inches	Black	Galv.	Inches	Black	Galv
		Butt Weld			
⅛	45	19½	¼ to ⅜	+11	+39

9 and 10	45	32½	9 to 12	16	2
11 and 12	44	31½			

To the large jobbing trade the above discounts on steel pipe are increased on black by one point, with supplementary discount of 5 and 5%, and on galvanized by 1½ points, with supplementary discount of 5%. On iron pipe, both black and galvanized, the above discounts are increased to large jobbers by one point with supplementary discounts of 5 and 2½%.

Note.—Chicago district mills have a base two-points less than the above discounts. Chicago delivered base is 2½ points less. Freight is figured from Pittsburgh, Lorain, Ohio, and Chicago district mills, the billing being from the point producing the lowest price to destination.

Boiler Tubes

Base Discounts, f.o.b. Pittsburgh

Lap Welded Steel		*Charcoal Iron*	
2 to 2¼ in.	27	1½ in.	+18
2½ to 2¾ in.	37	1¾ to 1⅞ in.	+ 8
3 in.	40	2 to 2¼ in.	— 2
3¼ to 3¾ in.	42½	2½ to 3 in.	— 7
4 to 13 in.	46	3¼ to 4½ in.	— 9

Beyond the above discounts, 7 fives extra are given on lap welded steel tubes and 2 tens to 2 tens and 1 five on charcoal iron tubes.

Standard Commercial Seamless Boiler Tubes

	Cold Drawn		
1 in.	60	3 in.	45
1¼ to 1½ in.	52	3¼ to 3½ in.	47
1¾ in.	36	4 in.	50
2 to 2¼ in.	31	4½, 5 and 6 in.	45
2½ to 2¾	39		
	Hot Rolled		
2 and 2¼ in.	37	3¼ and 3½ in.	53
2½ and 2¾ in.	45	4 in.	56
3 in.	51	4½, 5 and 6 in.	51

Less carloads, 4 points less. Add $8 per net ton for more than four gages heavier than standard. No extra for lengths up to and including 24 ft. Sizes smaller than 1 in. and lighter than standard gage to be held at mechanical tubes list and discount. Intermediate sizes and gages not listed take price of next larger outside diameter and heavier gage.

Seamless Mechanical Tubing

	Per Cent Off List
Carbon, 0.10% to 0.30%, base	55
Carbon, 0.30% to 0.40%, base	50

Plus differentials for lengths over 18 ft. and for commercial exact lengths. Warehouse discounts on small lots are less than the above.

Hot-Rolled Flats.—Hot strip mills are attempting to stabilize prices on wide strip and equalize them with blue annealed sheets and light plates by the adoption during the week of new prices on strip 12-gage and heavier, 12 to 24 in. wide. These are based according to gage on a plate price of 1.80c. and a blue annealed price of 2.10c. At the same time some mills announced an advance of $1 a ton on strip 6 in. and wider and the narrower widths. Releases on contracts are heavier than they have been and this month is showing up better than December.

Old Material—The market is hardly as strong as it was a week ago. One buyer who covered then and another who previously covered are not disposed to buy in competition with the dealers who sold them. Heavy melting steel is quotable at no more than $15.50, and dealers who were paying that price a week ago to cover short sales are now offering $15.25. Blast furnace grades are firm. It is difficult to interest foundries in purchases at more than the recent prices.

Prices per gross ton delivered consumers' yards in Pittsburgh and points taking the Pittsburgh district freight rate:

Basic Open-Hearth Furnace Grades:		
Heavy melting steel	$15.25 to	$15.50
Scrap rails	14.75 to	15.00
Compressed sheet steel	14.25 to	14.50
Bundled sheets, sides and ends	13.25 to	13.50
Cast iron carwheels	14.00 to	14.50
Sheet bar crops, ordinary	15.00 to	15.50
Heavy breakable cast	13.00 to	13.50
No. 2 railroad wrought	15.00 to	15.50
Heavy steel axle turnings	13.00 to	13.50
Machine shop turnings		11.00
Acid Open-Hearth Furnace Grades:		
Railroad knuckles and couplers	17.00 to	17.25
Railroad coil and leaf springs	17.00 to	17.25
Rolled steel wheels	16.50 to	17.00
Low phosphorus billet and bloom ends	18.50 to	19.00
Low phosphorus, mill plate	17.50 to	18.00
Low phosphorus, light grade	16.50 to	17.00
Low phosphorus sheet bar crops	17.50 to	18.00
Heavy steel axle turnings	13.00 to	13.50
Electric Furnace Grades:		
Low phosphorus punchings	16.50 to	17.00
Heavy steel axle turnings	13.00 to	13.50
Blast Furnace Grades:		
Short shoveling steel turnings	11.50 to	12.00
Short mixed borings and turnings	11.50 to	12.00
Cast iron borings	11.50 to	12.00
No. 2 busheling	10.00 to	10.50
Rolling Mill Grades:		
Steel car axles	18.00 to	19.00
No. 1 railroad wrought	11.00 to	11.50
Sheet bar crops	17.00 to	17.50
Cupola Grades:		
No. 1 cast	14.50 to	15.00
Rails 3 ft. and under	15.25 to	15.50
Malleable Grades:		
Railroad	15.25 to	15.50
Industrial	14.75 to	15.00
Agricultural	14.25 to	14.50

Bars, Plates and Shapes.—Bars continue to make the best showing of these products in orders and in mill schedules, but both plates and shapes have enjoyed a substantial betterment over the specifications for December. The current movement of these products is chiefly on shipping instructions against contracts or coverages for the fourth quarter. With the exception of plates, there are no suggestions that any first quarter business has been entered at less than 1.80c. and the concessions in plates have been exceptional. The Carnegie Steel Co. has issued a new card of extras on bars, adopting the quantity extras recently announced.

Warehouse Prices, f.o.b. Pittsburgh

	Base per Lb.
Plates	3.00c.
Structural shapes	3.00c.
Soft steel bars and small shapes	2.90c.
Reinforcing steel bars	2.75c.
Cold-finished and screw stock—	
Rounds and hexagons	3.60c.
Squares and flats	4.10c.
Bands	3.60c.
Hoops	4.00c. to 4.50c.
Black sheets (No. 24 gage), 25 or more bundles	3.65c.
Galvanized sheets (No. 24 gage), 25 or more bundles	4.50c.
Blue annealed sheets (No. 10 gage), 25 or more sheets	3.10c.
Galvanized corrugated sheets (No. 28 gage), per square	$4.39
Spikes, large	3.30c. to 3.40c.
Small	3.80c. to 5.25c.
Boat	3.80c.
Track bolts, all sizes, per 100 count,	62½ per cent off list
Machine bolts, per 100 count	62½ per cent off list
Carriage bolts, per 100 count	62½ per cent off list
Nuts, all styles, per 100 count,	62½ per cent off list
Large rivets, base per 100 lb.	$3.50
Wire, black soft annealed, base per 100 lb.	$3.00 to 3.10
Wire, galvanized soft, base per 100 lb.	3.00 to 3.10
Common wire nails, per keg	3.00
Cement coated nails, per keg	3.05

Bolts, Nuts and Rivets.—Bolt and nut business is improving but the demand for rivets still is rather slow. Prices are firm.

Warehouse Business.—Prices of sheets out of local warehouses were advanced 10c. per 100 lb. late last week. Warehouse quotations on nails also have been stiffened in keeping with the new base price and card of extras issued by the mills. Jobbers report some improvement in business with the turn of the year.

Coke and Coal.—Except that slack coal is a little less plentiful and commands more money, the general situation is about as it has been for some time, with ample supplies of both coal and coke and not much strength in prices.

Demand for Adirondack Ore Not Increasing, Says Decision

WASHINGTON, Jan. 10.—Statistics of the production of Adirondack iron ore do not afford much support to the claim of the Delaware & Hudson Co. that there is an increased demand for this ore, said the Interstate Commerce Commission in a decision made public recently denying the application of that company to acquire control of the Buffalo, Rochester & Pittsburgh Railway. It was contended by the applicant that shipments of Adirondack ore to the Pittsburgh district would largely increase "because the deposits of Lake Superior hematite ore, chiefly used in that district, are disappearing rapidly and their iron content is gradually decreasing, the standard having been 65 per cent in 1888 and being now 51.5, with the prospect of soon being reduced to 50 per cent." It was declared that it would therefore be necessary in the future to mine and utilize ores lower in iron content that can be concentrated and marketed economically at present, "and this will bring into the market increasing quantities of the Adirondack ores." The decision said that the record shows that there is practically an unlimited supply of low phosphorus, magnetic iron ore in the Adirondacks, "roughly estimated at 2,100,000,000 tons, from which almost any grade of iron can be made, while there are no Lake Superior ores from which low phosphorus iron can be made."

In stating that statistics do not support the claim of increased demand for Adirondack ore, the commission presented a table showing shipments, in tons, of iron originating on the Delaware & Hudson line in the years 1915 to 1925, inclusive, as follows:

1915	630,747	1921	109,241
1916	1,264,175	1922	180,385
1917	1,224,929	1923	562,877
1918	1,185,415	1924	202,148
1919	1,003,068	1925	342,026
1920	774,591		

Bethlehem to Offer Cash Prizes in Accident Prevention Work

The Bethlehem Steel Corporation has announced a series of gold awards for progress during 1928 in accident prevention. These awards will be made quarterly under a new plan to be inaugurated throughout the entire Bethlehem organization.

The organization will be divided into 11 groups, and the plan provides that the group making the greatest percentage of reduction in time lost due to accidents during each quarter of 1928 will be awarded a prize of $1,000 in gold. To the groups making the second and third best showings will be awarded prizes amounting to $500 and $250 respectively. A permanent trophy will be awarded to the group making the greatest reduction in the time lost due to accidents for the entire year 1928.

Semi-Finished Steel, Raw Materials, Bolts and Rivets

Mill Prices of Semi-Finished Steel

F.o.b. Pittsburgh or Youngstown

Billets and Blooms

	Per Gross Ton
Rerolling, 4-in. and over	$33.00
Rerolling, under 4-in. to and including 1¾ in.	$33.50 to 34.00
Forging, ordinary	38.00 to 39.00
Forging, guaranteed	43.00 to 44.00

Screw stock	$5.00 per ton over base
Carbon 0.20% to 0.40%	3.00 per ton over base
Carbon 0.41% to 0.55%	5.00 per ton over base
Carbon 0.56% to 0.75%	7.50 per ton over base
Carbon over 0.75%	10.00 per ton over base
Acid	15.00 per ton over base

*Chicago mill base is $43. Cleveland mill base, $42.

Prices of Raw Material

Ores

Lake Superior Ores, Delivered Lower Lake Ports

	Per Gross Ton
Old range Bessemer, 51.50% iron	$4.55
Old range non-Bessemer, 51.50% iron	4.40
Mesabi Bessemer, 51.50% iron	4.40
Mesabi non-Bessemer, 51.50% iron	4.25
High phosphorus, 51.50% iron	4.15

Foreign Ore, c.i.f. Philadelphia or Baltimore

	Per Unit
Iron ore, low phos., copper free, 55 to 58% iron in dry Spanish or Algeria	10.00c.
Iron ore, Swedish, average 66% iron,	9.25c. to 9.50c.
Manganese ore, washed, 52% manganese, from the Caucasus	39c.
Manganese ore, Brazilian, African or Indian, basis 50%	38c. to 39c.
Tungsten ore, high grade, per unit, in 60% concentrates	$10.25 to $10.75

	Per Gross Ton
Chrome ore, 45 to 50% Cr_2O_3, crude, c.i.f. Atlantic seaboard	$22.00 to $24.00

	Per Lb.
Molybdenum ore, 85% concentrates of MoS_2, delivered	50c. to 55c.

Coke

	Per Net Ton
Furnace, f.o.b. Connellsville prompt	$2.75
Foundry, f.o.b. Connellsville prompt	$3.75 to 4.50
Foundry, by-product, Ch'go ovens	9.00
Foundry, by-product, New England, del'd	11.50
Foundry, by-product, Newark or Jersey City, delivered	9.45 to 9.85
Foundry, Birmingham	5.00
Foundry, by-product, St. Louis	9.75

Coal

	Per Net Ton
Mine run steam coal, f.o.b. W. Pa. mines	$1.40 to $1.90
Mine run coking coal, f.o.b. W. Pa. mines	1.50 to 1.75
Mine run gas coal, f.o.b. Pa. mines	1.75 to 1.90
Steam slack, f.o.b. W. Pa. mines	1.00 to 1.10
Gas slack, f.o.b. W. Pa. mines	1.15 to 1.25

Ferromanganese

	Per Gross Ton
Domestic, 80%, furnace or seab'd	$100.00
Foreign, 80%, Atlantic or Gulf port, duty paid	100.00

Spiegeleisen

	Per Gross Ton Furnace
Domestic, 19 to 21%	$31.00 to $32.00
Domestic, 16 to 19%	29.00

Upset hex. cap screws, S.A.E. thread	85 and 5
Upset set screws	80, 10 and 10
Milled studs	70 and 5

Chicago

Steel Business and Prices Gain Strength —Operations Increase

CHICAGO, Jan. 10.—Chicago district steel mills, having eaten heavily into stocks of iron on the ground, are now watching the production of pig iron more closely. The Illinois Steel Co. has blown in its No. 9 stack at South Chicago, the second to be lighted in two weeks. The Inland Steel Co. is bringing its fourth stack in blast this week. These raise the active steel mill blast furnaces to 24 out of 36. In merchant pig iron the situation is different, and though shipments are on the upturn, furnace stocks are large. The operators of the Mayville furnace announce that the one unit in blast there will be blown out about the middle of the month.

Orders for railroad equipment include 1000 freight and 15 passenger cars, and fresh inquiry is for 500 freight and 20 passenger cars and 200 underframes. Business not yet in the form of definite inquiry includes 3000 freight cars for the Rock Island and at least an equal number of freight cars and additional suburban coaches for the Illinois Central.

Judged by the volume of business received and the price structure, the local steel market shows added signs of strength. In plates, shapes and bars 1.90c., Chicago, is well established and users, notably fabricators, are taking steps to pass on the advance in steel prices. Specifications are heavier than shipments, the latter representing 75 per cent of ingot capacity. Individual orders are larger as consumers feel the pinch of extended deliveries, which in the case of mild steel bars now are from two to four weeks.

Pig Iron.—Liquidation of charcoal furnace stocks, largely to middlemen, continues, with delivered prices that exceed by only a small margin the current quotations on Northern foundry iron. It is reported that close to $20, delivered, is being done at points where the freight rate is about $2.50, making the furnace price not far from $17.50 a ton. Local furnaces are taking no recognition of this competition and are holding to $18.50 on their products. Sales of Northern iron are at a steady rate and inquiry for the second quarter is more active. Shipments are gaining slowly and it is noticeable that malleable foundries, long out of the market, are in need of pig iron.

Prices per gross ton at Chicago:

Northern No. 2 foundry, sil. 1.75 to 2.25	$18.50
N'th'n No. 1 fdy., sil. 2.25 to 2.75	19.00
Malleable, not over 2.25 sil.	18.50
High phosphorus	18.50
Lake Superior charcoal, averaging sil. 1.50	27.04
Southern No. 2 fdy. (all rail)	22.01
Southern No. 2 (barge and rail)	20.18
Low phos., sil. 1 to 2 per cent, copper free	$28.50 to 29.00
Silvery, sil. 8 per cent	29.79
Bessemer ferrosilicon, 14 to 15 per cent	46.79

Prices are delivered consumers' yards except on Northern foundry, high phosphorus and malleable which are f.o.b. local furnace, not including an average switching charge of 61c. per gross ton.

Coke.—Contract and spot prices for by-product foundry coke are steady at $9, local ovens, and $9.50, delivered in the Chicago switching district.

Ferroalloys. — Spiegeleisen is showing added strength at $31, Hazard, Pa., in tonnage lots, and at $32 in carloads for the 19 to 21 per cent grade. Ferromanganese is quoted at $100, seaboard.

Prices delivered Chicago: 80 per cent ferromanganese, $107.56; 50 per cent ferrosilicon, $83.50 to $87.50; spiegeleisen, 19 to 21 per cent, $38.76 to $39.76.

Cast Iron Pipe.—It is reported that the low bid at Milwaukee on 5000 tons of 6 to 16-in. class C pipe was $25.85, Birmingham, or $34.35, delivered, which is about $2 a ton below the minimum obtained for the last several weeks. At Kenosha, Wis., the National Cast Iron Pipe Co. took 440 tons of 6- to 12-in. pipe in 16-ft. lengths at a base price of $28, Birmingham, or $36.50, delivered. Among fresh inquiries is 2000 tons of 4 to 8-in. class B pipe for Yellow Springs, Ohio, and 600 tons of 4 to 30-in. class B pipe for Portsmouth, Ohio. Indications are that a fair winter buying movement is getting under way. Deliveries are prompt in all sizes. One foundry in Birmingham has lost almost a week's production because of cold weather.

Prices per net ton, delivered Chicago: Water pipe, 6-in. and over, $36.20 to $38.20; 4-in., $40.20 to $42.20; Class A and gas pipe, $4 extra.

Plates.—Oil storage tanks for western Texas take 3000 tons of plates just purchased. Tank builders are well engaged and are issuing heavy specifications. Producers of steel are feeling the effect of recent car orders. Specifications are not heavy at the moment but car builders are actively preparing schedules against which shipments are to be made in the near future. The Texas & Pacific Railroad has ordered 500 gondola cars from the Pressed Steel Car Co., also 200 box, 300 flat and 15 passenger cars from the American Car & Foundry Co. Among fresh inquiries are 500 gondola cars for the Central of Georgia and 200 underframes for the Santa Fe. Plate mills are well engaged but still lag a little behind the rate of output of the other heavy tonnage products. Specifications from the general manufacturing trade are expanding slowly and plate requirements by structural fabricators show a decided improvement over the closing weeks of 1927. Prices are steady at 1.90c., Chicago.

Mill prices on plates per lb.: 1.90c., base, Chicago.

Structural Material.—A stir is being created in the local structural market by the possibility that fabricators will withdraw old quotations and put prices on a higher level. In some measure this is a reflection of the determination of mills to hold the recent advance in steel prices, but it also indicates that shops cannot much longer stand operation at low profit or none at all. This move has brought prospective builders and architects to realize that prices for structural steel are low and many projects have been hastened into the market. Greater activity is shown in the preparation of plans for the Marshall Field & Co. warehouse and estimaters expect plans on the Steuben Club building in the next week or so. New projects in Chicago include 6000 tons for the Forman Building, 3000 tons for an addition to the Drake Hotel, and 1800 tons for an extension of the Illinois Bell Telephone Co.'s holdings. Bridge contracts account for 3800 tons. Highway improvement programs include a large number of bridges and fabricators expect a substantial volume of business from that source during the coming spring and summer months. Prices are steady at 1.90c., Chicago.

Mill prices on plain material per lb.: 1.90c., base, Chicago.

Reinforcing Bars.—Prices for billet steel reinforcing bars are stronger at 2.30c. to 2.75c. out of Chicago warehouses. Sales are in small volume, but they measure well up to what can be expected at this time of the year. Bending shops have turned the year with shipments that represent about 55 per cent of fabricating capacity. Outstanding among new projects is 500 tons for a warehouse for Meyer-Marvis, Chicago. Competition in rail steel reinforcing bars is keen and prices range 1.80c. to 1.85c., Chicago Heights mills. New business and fresh inquiry are shown on page ....

Bars.—Mill deliveries of mild steel bars are extending and now range from two to three weeks. Sales continue active and like specifications are in excess of current shipments. Practically all classes of users are taking larger quantities though the most noteworthy improvement is from the automotive trade and accessory manufacturers. Farm implement makers are taking shipments in excess of the schedules previously arranged for the early weeks in January. The bar iron market is without feature and asking prices are 1.90c., Chicago. Shipments of alloy steel bars are growing as the automotive trade swings into heavier production. Output in the Chicago district is at 70 per cent. Bookings at rail steel bar mills are heavier than a year ago. Delivery is prompt and prices are steady at 1.80c., Chicago Heights mills.

Mill prices per lb.: Soft steel bars, 1.90c., base, Chicago; common bar iron, 1.90c., base, Chicago; rail steel bars, 1.80c., base, Chicago Heights mill.

Sheets.—Mills have heavy order books but specifications are in small volume and rolling schedules are difficult to arrange to maintain output at 70 per cent of hot mill capacity. Producers feel that a more active demand is near at hand and that the cause for the delay in specifications lies in the nearness of the inventory period and adjustments following the holiday period. There is little of note in the price situation. Order books are well loaded at lower quotations than are now being asked. Delivered prices in Chicago are 3.90c. for galvanized, 2.25c. to 2.35c. for blue annealed, depending on the width, and 3.05c. for black sheets. Stocks in the hands of manufacturers and jobbers are reported as small. Deliveries range from two to three weeks, depending on the grade.

Base prices per lb., delivered from mill in Chicago: No. 24 black, 3.05c.; No. 24 galvanized, 3.90c.; No. 10 blue annealed, 2.25c. to 2.35c. Delivered prices at other Western points are equal to the freight from Gary plus the mill prices, which are 5c. per 100 lb. lower than the Chicago delivered prices.

Cold Rolled Bars.—Producers have heavy bookings and specifications are growing in volume, affording an increase in output this week. Prices are steady at 2.20c., Chicago.

Wire Rods.—Sales are moderately active, with the bulk of orders taken at $43, Chicago mill base.

Wire Products.—Orders are in such volume that the 70 per cent rate of output reached a week ago is being maintained. There is a quickening in demand from practically all parts of the country, the Northwest excepted. Mill stocks are not being increased. Jobbers are alert to the possibility of an active spring demand and are rounding out and in some cases expanding stocks. Railroad purchases are heavier by a small margin and shipments to the manufacturing trade show improvement. Orders for nails are considered good for this time of year.

Rails and Track Supplies.—Rail purchases in the week totaled 19,000 tons. The outstanding order, from the Cotton Belt Railroad, was distributed as follows: Bethlehem Steel Co., 5000 tons; Illinois Steel Co., 4500 tons, and Inland Steel Co., 4300 tons. Fresh inquiry and business that is in the making in territory tributary to Chicago district mills total not less than 100,000 tons. Rail mill output is now close to 80 per cent of capacity. Four Western railroads have closed for 15,000 tons of track accessories, and pending inquiry gives promise of an active market for several weeks to come. Production of track supplies is lagging at 60 per cent of capacity. For the first time in months there is a moderate demand for iron tie plates and several lots have been purchased.

Prices f.o.b. mill, per gross ton: Standard-section open-hearth and Bessemer rails, $43; light rails, rolled from billets, $36. *Per Lb.:* Standard railroad spikes, 2.80c.; track bolts with square nuts, 3.80c.; steel tie plates, 2.25c.; angle bars, 2.75c.

Old Material.—This market is taking on more life. Individual purchases are not large but they are numerous and are being made principally by foundries and users of specialties. A notable development in the week is the greater activity shown by malleable foundries which are now openly seeking supplies of scrap. Dealers continue to look for added strength and they do not hesitate to bid up railroad lists. A sale of 2000 tons of cast iron borings is reported at $11.25, delivered, an advance of 50c. since the last consumer purchase. A scarcity exists in short rails and iron grades, notably iron angles, arch bars and axles. Railroads are said to have obtained close to $13.50, delivered, for heavy melting, which is a reflection of a belief in the trade that two steel mills and possibly a third will soon be in the market.

Prices delivered consumers' yards, Chicago:

Per Gross Ton

Basic Open-Hearth Grades:		
Heavy melting steel	$12.50 to	$13.00
Shoveling steel	12.50 to	13.00
Frogs, switches and guards, cut apart, and miscellaneous rails	13.75 to	14.25
Hydraulic compressed sheets	10.75 to	11.25
Drop forge flashings	9.75 to	10.25
Forged, cast and rolled steel carwheels	15.50 to	16.00
Railroad tires, charging box size	16.25 to	16.75
Railroad leaf springs, cut apart	16.25 to	16.75
Acid Open-Hearth Grades:		
Steel couplers and knuckles	15.00 to	15.50
Coil springs	16.50 to	17.00
Low phosphorus punchings	14.25 to	14.75
Electric Furnace Grades:		
Axle turnings	12.50 to	13.00
Blast Furnace Grades:		
Axle turnings	10.75 to	11.25
Cast iron borings	10.75 to	11.25
Short shoveling turnings	10.50 to	11.00
Machine shop turnings	7.75 to	8.25
Rolling Mill Grades:		
Iron rails	13.50 to	14.00
Rerolling rails	15.00 to	15.50
Cupola Grades:		
Steel rails less than 3 ft	15.50 to	16.00
Angle bars, steel	14.75 to	15.25
Cast iron carwheels	14.00 to	14.50
Malleable Grades:		
Railroad	13.75 to	14.25
Agricultural	12.50 to	13.00
Miscellaneous:		
*Relaying rails, 56 to 60 lb.	23.00 to	25.00
*Relaying rails, 65 lb. and heavier	26.00 to	31.00
Per Net Ton		
Rolling Mill Grades:		
Iron angle and splice bars	14.00 to	14.50
Iron arch bars and transoms	18.75 to	19.25
Iron car axles	21.50 to	22.00
Steel car axles	16.00 to	16.50
No. 1 railroad wrought	11.50 to	12.00
No. 2 railroad wrought	11.50 to	12.00
No. 1 busheling	9.50 to	10.00
No. 2 busheling	4.50 to	5.00
Locomotive tires, smooth	12.50 to	13.00
Pipes and flues	8.00 to	8.50
Cupola Grades:		
No. 1 machinery cast	14.50 to	15.00
No. 1 railroad cast	13.50 to	14.00
No. 1 agricultural cast	13.50 to	14.00
Stove plate	12.00 to	12.50
Grate bars	11.75 to	12.25
Brake shoes	12.00 to	12.50

*Relaying rails, including angle bars to match, are quoted f.o.b. dealers' yards.

Warehouse Prices, f.o.b. Chicago

	Base per Lb.
Plates and structural shapes	3.10c.
Soft steel bars	3.00c.
Reinforcing bars, billet steel	2.30c. to 2.75c.
Cold-finished steel bars and shafting—	
Rounds and hexagons	3.60c.
Flats and squares	4.10c.
Bands	3.65c.
Hoops	4.15c.
Black sheets (No. 24)	3.95c.
Galvanized sheets (No. 24)	4.80c.
Blue annealed sheets (No. 10)	3.50c.
Spikes, standard railroad	3.55c.
Track bolts	4.55c.

Hot-pressed nuts, squares, tapped or blank	60
Hot-pressed nuts, hexagons, tapped or blank	60
No. 8 black annealed wire, per 100 lb.	$3.20
Common wire nails, base per keg	$2.90 to 3.00
Cement coated nails, base per keg	2.90 to 3.00

Koppers Co. Not Affiliated with U. G. I.

The statement appearing on page 85 of THE IRON AGE of Jan. 5 to the effect that the Koppers Co. is affiliated with the United Gas Improvement Co. calls for correction. The two companies are entirely separate and the only connection between them is the fact that the Philadelphia City Council recently authorized the building of a coke plant in Philadelphia, which will be financed and erected by the Koppers Co., while the gas produced will be sold to the United Gas Improvement Co. Details of that transaction were published in THE IRON AGE of Dec. 29 last, page 1831.

Employees of the General Electric Co. who have been in its service for six months or more are holders of about $30,000,000 worth of General Electric Securities Corporation bonds, according to a statement of J. R. Lovejoy, president of the corporation and vice-president of the General Electric Co. Bondholders number 27,000, or about 42 per cent of the company's employees, and the average holding per person is approximately $1,000.

New York

Large Orders Placed for Iron and Steel for Tunnel

NEW YORK, Jan. 10.—The inventory period, which for some foundries will last until the middle of the month, has adversely affected pig iron buying. Sales by local brokers during the week totaled only 3500 tons. Deliveries against contracts are moving forward in good volume, however, and in some cases iron that had been held up has been released for shipment. The Worthington Pump & Machinery Corporation, New York, has closed for 300 tons for its Cincinnati plant and about 500 tons for its Buffalo works, but has not yet bought against its inquiry for 400 tons for Holyoke, Mass. The New York Central Railroad is in the market for 235 tons for delivery at Frankfort, N. Y., or Elkhart, Ind. The iron called for includes 75 tons each of No. 2 plain and No. 2X, 50 tons of No. 1 and 35 tons of 8 per cent silicon. The Baldwin Locomotive Works is asking for prices on 2000 to 4000 tons for its plant at Eddystone, Pa. Prices are slightly firmer, with $16.50, base furnace, the usual minimum on Buffalo foundry iron, and with some sales bringing $17. No sales of eastern Pennsylvania foundry iron have been reported at less than $19, base furnace, and a number of producers have advanced prices to $19.50. The Mason & Hanger Co., contractor, New York, has divided an order for 54,000 tons of cast iron segments for the Fulton Street subway tunnel connecting Manhattan and Brooklyn between the Davies & Thomas Co., Catasauqua, Pa., and the Bethlehem Steel Co. The No. 2 furnace of Witherbee, Sherman & Co. at Port Henry, N. Y., was blown in Jan. 3.

Prices per gross ton, delivered New York district:

Buffalo No. 2 fdy., sil. 1.75 to 2.25	$21.41 to $21.91
East. Pa. No. 2 fdy., sil. 1.75 to 2.25	20.39 to 21.52
East. Pa. No. 2 fdy., sil. 2.25 to 2.75	20.89 to 22.02
East. Pa. No. 1X fdy., sil. 2.75 to 3.25	21.39 to 22.52

Freight rates: $4.91 from Buffalo, $1.39 to $2.52 from eastern Pennsylvania.

Reinforcing Bars.—The market has seen little activity since the first of the year, and the small pending tonnage offers no immediate prospect of increased business. A State office building in Manhattan will require 120 tons. With small buying, distributers have had no difficulty in holding to the recently established mill price of 1.90c., Pittsburgh, and are quoting 2.20c., Youngstown warehouse, or 2.57½c., on cars at New York. Out of New York warehouses, the price is 2.80c. per lb. for lots of 5 tons or more, 2.95c. for lots of 2 to 5 tons and 3.24c. for less than 2 tons, all delivered at job.

Cast Iron Pipe.—Little new business is in the market, but most makers of gas and water pipe are fairly well sold up for 30 to 60 days and prices are maintained with $28 per ton, base Birmingham, about the minimum. The Department of Purchase, New York, opened bids Jan. 9, on about 2200 tons of pipe and fittings. On the five sections covering pipe, bids were as follows: Section 1, 260 tons of 12-in., low bid $37.10 per ton, National Cast Iron Pipe Co.; section 2, 595 tons of 8-in., low bid $39.80, Donaldson Iron Co.; section 3, 595 tons of 8-in., low bid $39.80 per ton, Donaldson Iron Co.; section 4, 595 tons of 8-in., low bid $37.10 per ton, National Cast Iron Pipe Co.; section 5, 80 tons of 6-in., low bid $37.65 per ton, National Cast Iron Pipe Co. On the fittings low bidders were R. D. Wood & Co., Thomasville Iron Co. and the Talladega Foundry & Machine Co. The Middlesex Water Co., Woodbridge, N. J., has taken bids on about 600 tons of water pipe. Charles A. Tenney & Co., Boston, recently closed on about 3000 tons of pipe for public utilities.

Prices per net ton, delivered New York: Water pipe 6-in. and larger, $37.25 to $38.25; 4-in. and 5-in., $42.25 to $43.25; 3-in., $52.25 to $53.25; Class A and gas pipe, $4 to $5 extra.

Finished Steel.—Somewhat of a lull has followed the fairly heavy specifications of the last week or two of December. Mill shipments of bars, shapes and plates are largely against fourth quarter contracts, little new buying having developed. The extent to which sheet manufacturers covered their customers for first quarter at former prices will militate against the placing of much business at the new prices for some time to come. A buyer of galvanized sheets, with 200 tons to place, is reported to have been able to cover his requirements at 3.65c., Pittsburgh, regardless of the fact that he had no contract. Some makers of hot rolled strip steel have advanced prices to 1.85c., Pittsburgh, for sizes wider than 6 in. and to 2.05c., Pittsburgh, for the narrower widths. Extras on gages which meet competition of light plates and blue annealed sheets have also been put into effect, making these widths approximately the same in price as the competitive prod-

Warehouse Prices, f.o.b. New York

	Base per Lb.
Plates and structural shapes	3.34c.

ucts. In structural steel the principal letting was 9000 tons for shields for the Fulton Street tunnel of the New York subway system, which will be fabricated by the American Bridge Co. Bids are being taken on an additional 7800 tons for subway work.

Mill prices per lb., delivered New York: Soft steel bars, 2.14c.; plates, 2.12½c.; structural shapes, 2.09½c.; bar iron, 2.14c.

Warehouse Business.—The new year has begun with a good volume of purchasing from stock. There is a moderate demand for structural material in small lots and plate users are quite active. Quantity extras on cold rolled shafting and screw stock have been revised so that the minimum quantity on which no extra is charged is 4000 instead of 6000 lb. An extra of 20c. per 100 lb. applies on purchases of less than 4000 lb. and more than 2000 lb.

Coke.—Standard foundry is substantially unchanged at about $4 per net ton, Connellsville, for prompt shipment. Furnace coke, which developed some strength on the recent report that output was being curtailed, is again obtainable at less than $3 per ton, Connellsville. The local producer of by-product coke has reduced prices from $8.75 per ton, f.o.b. ovens, to $8.30 per ton for foundry coke and to $8 per ton for screened sizes. Delivered prices on Connellsville foundry coke are: To northern New Jersey, $8.03; to New York or Brooklyn, $8.79; to Newark or Jersey City, N. J., $7.91. By-product foundry coke, on the new basis of $8.30 per net ton, f.o.b. ovens, is quoted at $9 to $9.40, delivered Newark or Jersey City.

Old Material.—New contracting is confined to small tonnages of material. Prices are firm and unchanged with a fair volume of tonnage moving to eastern Pennsylvania consumers. No. 1 heavy melting steel continues at $13.50 per ton, delivered to Bethlehem, Coatesville, Conshohocken, Pa., or Claymont, Del. On shipments to a consumer in Lebanon, Pa., forge fire is being purchased at $10.50 per ton, delivered, and specification pipe at $12.50 to $13 per ton. Yard grade of heavy melting steel is quoted at $11 per ton, delivered Phoenixville or Harrisburg, Pa. Mixed borings and turnings are quiet at $10 per ton, delivered to Bethlehem or Swedeland, Pa.

Dealers' buying prices per gross ton, New York:

No. 1 heavy melting steel	$10.00 to $10.85
Heavy melting steel (yard)	6.25 to 7.25
No. 1 heavy breakable cast	11.25 to 12.00
Stove plate (steel works)	8.25 to 8.75
Locomotive grate bars	8.25 to 8.50
Machine shop turnings	6.50 to 7.50
Short shoveling turnings	6.50 to 7.50
Cast borings (blast furnace or steel works)	6.75 to 7.25
Mixed borings and turnings	6.50 to 7.50
Steel car axles	17.00 to 17.50
Iron car axles	23.75 to 24.75
Iron and steel pipe (1 in. diam., not under 2 ft. long)	8.75 to 9.25
Forge fire	6.50 to 7.00
No. 1 railroad wrought	10.50 to 11.00
No. 1 yard wrought, long	9.00 to 9.50
Rails for rolling	10.50 to 11.00
Cast iron carwheels	11.25 to 11.75
Stove plate (foundry)	8.75 to 9.25
Malleable cast (railroad)	10.00 to 10.50
Cast borings (chemical)	11.00 to 12.00

Prices per gross ton, delivered local foundries:

No. 1 machinery cast	$13.50 to $14.00
No. 1 heavy cast (columns, building materials, etc.), cupola size	11.50 to 12.00
No. 2 cast (radiators, cast boilers, etc.)	11.00 to 11.50

Warehouse Prices, f.o.b. Cleveland

	Base per Lb.
Plates and structural shapes	3.00c.

Blue annealed sheets (No. 10)	3.25c.
No. 9 annealed wire, per 100 lb	$2.90
No. 9 galvanized wire, per 100 lb	3.35
Common wire nails, base per keg	2.90

*Net base, including boxing and cutting to length.

Cleveland

Steel Business Improved—Sheet Bars $1 Lower—Wide Strips Higher

CLEVELAND, Jan. 10.—The steel industry is feeling the effects of the increase in production schedules by automobile manufacturers and is getting a good volume of specifications from that source, particularly for forging bars, sheets, hot and cold rolled strip and alloy steel. With heavy specifications for steel bars, plates and structural material before the expiration on Dec. 31 of contracts at 1.75c., Pittsburgh, an expected lull in orders developed in the past week. However, mills during the week took a fair amount of small-lot business at 1.80c., which appears to be holding firmly in this market. Sheet and hot-rolled strip buyers were not restricted in their low-price contracts to December specifications; consequently they are still sending in good orders for these products at lower prices than the mills are now asking. Stamping plants in this territory are now running at capacity on automotive work and most of the forge shops are busy. The Ford Motor Co. is ordering steel more freely than recently and during the week placed specifications with an Ohio mill for 1000 tons of sheets.

Concessions of $1 or more a ton have appeared on sheet bars. Hot strip mills are attempting to stabilize prices on wide strip and equalize them with blue annealed sheets and light plates by the adoption during the week of new prices on strip 12-gage and heavier, 12 to 24 in. wide. At the same time they announced a price advance of $1 a ton.

A projected Detroit River tunnel will require 4000 tons of structural material. Lake shipyards have an inquiry for a fire tug for Chicago requiring 250 tons of plates.

Pig Iron.—The market is still moderately active, although the heavy buying movement that lasted for several weeks has subsided. Cleveland interests during the week sold approximately 25,000 tons of foundry and malleable or about half as much as during some of the previous weeks. A Michigan foundry purchased 5000 tons, but a large share of the week's orders were small lots. Most consumers are now covered for the quarter. Inquiry has fallen off, although one producer is quoting on about 12,000 tons. Some of the Lake furnaces that have good order books are showing less disposition to reach out for business in highly competitive districts where they must absorb a high freight rate. A few of the Lake furnaces are now holding to a minimum of $17 for foundry and malleable iron and to the regular silicon differentials. While $16.50 has not entirely disappeared, $16.75 seems to have become the more common minimum quotation. In Michigan there is a range of $17.50 to $18. Some small lot sales are reported in the Valley district at $17.25. Shipping orders, which dropped off in December, have increased materially in the past week. The Corrigan, McKinney Steel Co., has relighted a furnace that was out for repairs and has now all of its Cleveland furnaces in blast.

Prices per gross ton at Cleveland:

N'th'n No. 2 fdy., sil. 1.75 to 2.25	$18.50
Southern fdy., sil. 1.75 to 2.25	22.00
Malleable	18.50
Ohio silvery, 8 per cent	28.00
Basic, Valley furnace	17.00
Standard low phos., Valley furnace	$26.50 to 27.00

Prices, except on basic and low phosphorus, are delivered Cleveland. Freight rates: 50c. from local furnaces; $3 from Jackson, Ohio; $6 from Birmingham.

Iron Ore.—On Jan. 1 there was 6,604,339 tons of Lake Superior ore on docks at Lake Erie ports as compared with 7,139,610 tons on the same date a year ago. Shipments from these docks during December were 340,322 tons as compared with 562,404 tons in December, 1926.

Semi-Finished Steel.—A price reduction on sheet bars of $1 a ton or more from the $34 price that prevailed during the last quarter has been made by a Cleveland producer, which reports the closing of contracts with most of its trade at an average price of $33, Cleveland, the price depending on the location of consumer's plant. Billets and slabs are being quoted on the same price basis. Sheet bars are reported available from another source for early shipment on a Youngstown basis of $32.

Sheets.—Mills are getting heavy specifications against low-priced contracts placed late in the year and a moderate amount of small-lot business at the new prices. The market has a firmer tone and small-lot sales are being made at 2.90c., Pittsburgh, for black and 2.05c. to 2.10c. for blue annealed. Some galvanized sheets have been sold at 3.75c., Pittsburgh, although these are still available at 3.65c. Consumers bought so freely at the old prices that not much of a test of the market on round-lot business is expected for several weeks.

Cold Rolled Strip.—Demand has been stimulated by the increased production by automobile manufacturers and orders are more plentiful than for some time. Prices are steady at 2.75c., Cleveland, for three tons and over and at 3c. for smaller lots.

Reinforcing Bars.—Several good jobs are still pending but inquiry is light. On billet steel bars, quotations of 1.75c., Cleveland, are still reported. Rail steel bars are unchanged at 1.65c., mill.

Warehouse Business.—Orders are light but are expected to pick up as soon as inventories are over. Jobbers have placed in effect the new extras on steel bars but as yet have made no advance on sheets to reflect the higher mill prices.

Old Material.—A Valley district mill has purchased heavy melting steel for a month's needs at $15.25 for No. 1 material, or the same price it paid in December. Local mills are making no new purchases, but they have started this month to take shipments of steel-making scrap on contracts more freely. Considerable of the Detroit scrap that was going to Buffalo when Lake boats were running is now being shipped to Canton and Valley district consumers. While the market generally has a firm tone quotations are unchanged and there is not much expectation of higher prices. Dealers are able to buy heavy melting steel for shipment against outstanding orders at the prices which they have paid for several weeks.

Prices per gross ton, delivered consumers' yards:

Basic Open-Hearth Grades	
No. 1 heavy melting steel	$13.75 to $14.00
No. 2 heavy melting steel	13.25 to 13.50
Compressed sheet steel	12.75 to 13.00
Light bundled sheet stampings	11.50 to 11.75
Drop forge flashings	12.50 to 13.00
Machine shop turnings	9.00 to 9.25
No. 1 railroad wrought	11.50 to 12.00
No. 2 railroad wrought	13.50 to 14.00
No. 1 busheling	11.50 to 12.00
Pipes and flues	9.00 to 9.50
Steel axle turnings	12.50 to 13.00
Acid Open-Hearth Grades	
Low phosphorus forging crops	16.50 to 17.00
Low phosphorus, billet, bloom and slab crops	17.00 to 17.50
Low phosphorus sheet bar crops	16.50 to 17.00
Low phosphorus plate scrap	16.00 to 16.50
Blast Furnace Grades	
Cast iron borings	10.25 to 10.75
Mixed borings and short turnings	10.25 to 10.75
No. 2 busheling	10.25 to 10.75
Cupola Grades	
No. 1 cast	16.00 to 16.50
Railroad grate bars	11.00 to 12.00
Stove plate	12.00 to 12.50
Rails under 3 ft	18.00 to 18.50
Miscellaneous	
Railroad malleable	15.00 to 15.50
Rails for rolling	16.25 to 16.50

Hot Rolled Strip.—A new price schedule on hot rolled strip steel, 12-gage and heavier, 12 in. to 24 in. wide, has been adopted by some of the mills to equalize prices on wide hot strip with two keenly competitive products, light plates and blue annealed sheets. Quotations shown in the new schedule are 3/16 in. or No. 7-gage, 2c., Pittsburgh; No. 8 gage, 2.10c.; Nos. 9 and 10 gages, 2.20c.; Nos. 11 and 12 gages, 2.25c. These prices probably will be quite generally adopted. At the same time some of the mills announced an advance of $1 a ton in the regular price on strip not covered in the above classification. The new prices are 1.85c., Pittsburgh, for material 6 in. and wider and 2.05c. for narrower than 6 in.

Bolts, Nuts and Rivets.—Specifications for bolts and nuts have increased since the first of the year and some makers have been able to increase their operations. Considerable business is coming from the automotive industry. Prices are firm. Nearly all buyers are now under contract. Rivet orders show some gain.

Fluorspar.—The only activity in gravel fluorspar was in car lots, which have brought $15, mines, indicating that the market has settled to that price for small lots. The market has not been tested on a large tonnage.

Coke.—The recent cold spell has stimulated the demand for by-product coke for domestic use but the price is unchanged at $4.50, ovens, for egg size. Connellsville foundry coke is weak, with a price range from $3.75 to $4.50, except for premium brands, some of which are quoted as high as $5.35. Foundry heating coke ranges from $2.75 to $3.25.

Philadelphia

Steel and Pig Iron Improved—Pennsylvania Railroad Inquires

PHILADELPHIA, Jan. 10.—Sentiment is decidedly better both in steel and pig iron as a result of the moderate improvement in purchasing since the beginning of the year. In some cases mills report more contracts for first quarter than in any previous quarter for the past year or more, consumers apparently being convinced that prices will not be lower during the current quarter and therefore are willing to protect themselves. Some structural steel contracts made at lower prices in the fourth quarter are being held open to allow more time to fabricators, who have been unable to completely prepare specifications on certain construction work.

Requirements of the Pennsylvania Railroad for first quarter, bids on which open Jan. 20, call for about 25,000 tons of plates for car and locomotive work, about 8000 tons of bars, 2000 tons of shapes and small lots of bands and spring steel. Bids were opened Jan. 6 on 1100 tons of blue annealed, black and galvanized sheets, 250,000 track bolts, 1,600,000 spikes, 24,000 wrought steel freight car wheels, and 460 piston heads.

Pig iron is more active and a good tonnage was booked in the past week. Prices have been advanced 50c. a ton on foundry iron, but the new level is as yet untested. Scrap buying shows no improvement but prices are firmer.

Pig Iron.—Purchases in the past week are estimated at more than 15,000 tons, the greater part of which was in small tonnages. Consumers are specifying more freely against contracts. An advance on foundry iron of 50c. a ton to $19.50, base, has received no test and most outstanding quotations are at the former level. One of the larger foundry iron purchases of the past week was about 2000 tons by the East Penn Foundry Co., Macungie, Pa., divided between two furnaces. The Baldwin Locomotive Works is inquiring for about 4000 tons of floor iron, 2.50 to 3 per cent silicon, and cylinder iron, 1 to 1.40 per cent silicon. A number of inquiries for a few hundred tons each are also reported and some

Warehouse Prices, f.o.b. Philadelphia

	Base per Lb.
Plates, ¼-in. and heavier	2.50c. to 2.60c.
Plates, $\frac{3}{16}$-in.	2.80c. to 3.00c.
Structural shapes	2.50c. to 2.60c.
Soft steel bars, small shapes and iron bars (except bands)	2.50c. to 2.60c.
Round-edge iron	3.50c.
Round-edge steel, iron finished, 1½ x 1½ in.	3.50c.
Round-edge steel, planished	4.30c.
Reinforcing steel bars, square, twisted and deformed	2.50c. to 3.00c.
Cold-finished steel, rounds and hexagons	3.25c. to 5.25c.
Cold-finished steel, squares and flats	3.75c. to 5.75c.
Steel hoops	3.85c. to 4.15c.

¼-in.	5.30c.
$\frac{3}{16}$-in.	5.50c.
Rails	3.20c.
Swedish iron bars	6.60c.

small lots of low phosphorus have been closed. Basic iron is unchanged.

Prices per gross ton at Philadelphia:

East. Pa. No. 2 plain, 1.75 to 2.25 sil.	$19.76 to $20.26
East. Pa. No. 2X, 2.25 to 2.75 sil.	20.26 to 20.76
East. Pa. No. 1X	20.76 to 21.26
Basic (delivered eastern Pa.)	19.50 to 19.75
Gray forge	19.50 to 20.00
Malleable	21.00 to 21.50
Standard low phos. (f.o.b. New York State furnace)	23.00 to 24.00
Copper bearing low phos. (f.o.b. furnace)	23.50 to 24.00
Virginia No. 2 plain, 1.75 to 2.25 sil.	24.54 to 25.04
Virginia No. 2X, 2.25 to 2.75 sil.	25.04 to 25.54

Prices, except as specified otherwise, are delivered Philadelphia. Freight rates: 76c. to $1.64 from eastern Pennsylvania furnaces; $4.54 from Virginia furnaces.

Billets.—Purchasing continues small and is almost entirely for immediate requirements. Quotations are $33 per ton, Pittsburgh, for rerolling billets and $38 per ton, Pittsburgh, for forging quality.

Bars.—Quotations are firm at 1.80c. per lb., Pittsburgh, or 2.12c., delivered Philadelphia. The list of the Pennsylvania Railroad includes about 8000 tons of bars for first quarter. Consumers are quite freely making contracts for first quarter.

Shapes.—Slight irregularity of prices is evident with quotations of 2.07c. to 2.08c. per lb., base, delivered Philadelphia.

Plates.—The price of 2.05c. per lb., delivered Philadelphia, is being maintained, quotations being based on 1.95c., Coatesville mills. In cases where a Pittsburgh base would be of advantage to a consumer, Eastern mills have been willing to quote on a basis of 1.75c. per lb., Pittsburgh. On the Pennsylvania Railroad list of first quarter requirements is a total of 25,000 tons of plates.

Sheets.—There is a moderate demand for sheets, but prices are not strong. Blue annealed sheets are quoted at 2.10c. per lb., base Pittsburgh, on widths up to 40 in. Wider than 40-in. sheets are on a 2.20c. per lb. Pittsburgh base. Buyers have offered to enter into contracts at 2.10c., base, per lb., but some mills show unwillingness to go below 2.15c. on first quarter contracts. This is also evident in black sheets, which are currently quoted at 2.75c. to 2.80c. per lb., base Pittsburgh, but for which makers are asking 2.90c. per lb., base, on contracts. Galvanized sheets are quiet and fairly firm at 3.75c. per lb., Pittsburgh base.

Warehouse Business.—There is considerably more activity and prices are slightly firmer on most products.

Old Material.—Unaffected by the slight improvement that has appeared in the new material field, the scrap market continues quiet and prices substantially unchanged. No. 1 forge fire, railroad grate bars and stove plate are slightly stronger.

Prices per gross ton delivered consumers' yards, Philadelphia district:

No. 1 heavy melting steel	$13.50 to $14.00
Scrap T rails	13.00 to 13.50
No. 2 heavy melting steel	11.00 to 11.50
No. 1 railroad wrought	15.25 to 15.75
Bundled sheets (for steel works)	10.50 to 11.00
Machine shop turnings (for steel works)	11.00
Heavy axle turnings (or equivalent)	12.00 to 12.50
Cast borings (for steel works and rolling mill)	11.00 to 11.25
Heavy breakable cast (for steel works)	15.50 to 16.00
Railroad grate bars	12.50 to 13.00
Stove plate (for steel works)	12.50 to 13.00
No. 1 low phos., heavy, 0.04 per cent and under	18.00 to 18.50
Couplers and knuckles	16.00
Rolled steel wheels	15.50 to 16.00
No. 1 blast furnace scrap	10.00 to 10.50
Machine shop turnings (for rolling mill)	11.00 to 11.50
Wrought iron and soft steel pipes and tubes (new specifications)	13.00 to 13.50
Shafting	17.50 to 18.00
Steel axles	19.00 to 20.00
No. 1 forge fire	11.00 to 12.00
Steel rails for rolling	15.00 to 15.50
Cast iron carwheels	15.50
No. 1 cast	16.00 to 16.50
Cast borings (for chemical plant)	15.00 to 15.50

Imports.—In the last week of December and the first week of January a total of 3932 gross tons of pig iron was received at this port, of which 2831 tons came from India and 99 tons from the Netherlands. In the same period 7400 tons of Algerian iron ore was received, 100 tons of British ferromanganese, 45 tons of shapes from France and 21 tons of steel bars and 11 tons of iron bars from Sweden.

Another Increase in Steel Corporation's Unfilled Orders

A fairly large increase in the unfilled orders of the United States Steel Corporation is reported for December. The total on Dec. 31 was 3,972,874 tons, an increase of 518,430 tons over the 3,454,444 tons on Nov. 30. This compares with one of 113,404 tons in November. A year ago the unfilled orders were 3,960,969 tons. The following table gives the unfilled tonnage by months, commencing with January, 1925:

	1927	1926	1925
Jan. 31	3,800,177	4,882,739	5,037,323
Feb. 28	3,597,119	4,616,822	5,284,771
Mar. 31	3,553,140	4,379,935	4,863,564
April 30	3,456,132	3,867,976	4,446,568
May 31	3,050,941	3,649,250	4.049,800
June 30	3,053,246	3,478,642	3,710,458
July 31	3,142,014	3,602,522	3,539,467
Aug. 31	3,196,037	3,542,335	3,512,803
Sept. 30	3,148,113	3,593,509	3,717,297
Oct. 31	3,341,040	3,683,661	4,109,183
Nov. 30	3,454,444	3,807,447	4,581,780
Dec. 31	3,972,874	3,960,969	5,033,364

The high record in unfilled orders was 12,183,093 tons at the close of April, 1917. The lowest was 2,674,757 tons on Dec. 31, 1910.

Automotive Parts and Accessories Manufacturers Are Merged

The Kingston Products Corporation, Kokomo, Ind., has been formed as a consolidation of the Kokomo Brass Works, Byrne, Kingston & Co. and the Kokomo Electric Co., all of Kokomo. The three companies have been closely allied for more than 25 years, but the merger will bring about closer cooperation by the engineering, executive and sales organizations than was possible before.

Products of the Kokomo Brass Works, which have been marketed by Byrne, Kingston & Co., include carburetors, Oil-Vac fuel feeding systems and tractor governors. The company also makes a varied line of water and oil pumps, motor parts and bronze, brass and aluminum castings. The Kokomo Electric Co. manufactures coils, switches, ignition points, generator cutouts, car heaters and B current supply units for radio sets.

J. Paul Johnson, president of the new company, is prominently identified with Kokomo industry, being an officer and a director of the Hoosier Iron Works, the Kokomo Malleable Iron Works, the Kokomo Stamped Metal Co. and the Kokomo Lithographic Co. Karl Krebser, vice-president and factory manager of the new company, has been associated with the Kokomo Brass Works for 23 years, the last eight as general factory manager. Paul T. Burke, the new secretary and general sales manager, has been general sales manager of Byrne, Kingston & Co. for 10 years. Frank C. Ryan, treasurer, has served four years as Chicago branch manager for the three merging companies and more recently has been assistant general manager of the brass works. The rest of the personnel of the three companies will remain practically unchanged.

Campbell Heads Interstate Commerce Commission for 1928

Johnston B. Campbell has been elected chairman of the Interstate Commerce Commission for 1928, succeeding John J. Esch. Mr. Campbell presided at the general investigation of freight rates on iron and steel products in Official Classification territory which was conducted during the first half of 1927. The commission is at present engaged in an examination of the testimony and briefs introduced into the case.

San Francisco

Large Steel Bookings Feature First Week of New Year

SAN FRANCISCO, Jan. 7 (*By Air Mail*).—Bookings have involved some good-sized tonnages, starting the new year encouragingly. The outlook in most lines is hopeful. Outstanding among the awards were 8500 tons of reinforcing steel for the Coyote Point bridge, San Francisco, taken by the Bethlehem Steel Co.; 2100 tons of shapes for two bridges near Seattle, Wash., for the Simpson Logging Co., placed with the United States Steel Products Co., and 1100 tons of shapes for an apartment at Long Beach, Cal., awarded to the McClintic-Marshall Co.

Tabulations of building permits for 1927 show that the majority of the cities on the Pacific Coast were ahead of the aggregate for the previous year. Los Angeles led the other cities with a total of $123,027,239. Seattle and Portland issued $29,070,080 and $28,973,155, respectively.

Pig Iron.—Sales and inquiries this week were limited to unimportant lots. No changes in prices are noted.

Prices per gross ton at San Francisco:

*Utah basic	$25.00 to $26.00
*Utah foundry, sil. 2.75 to 3.25	25.00 to 26.00
**Indian foundry, sil. 2.75 to 3.25	24.00 to 25.00
**German foundry, sil. 2.75 to 3.25	24.25

*Delivered San Francisco.
**Duty paid, f.o.b. cars San Francisco.

Shapes.—Demand for structural steel continues good, and during the first week of the year over 4000 tons was placed. Among the larger projects pending are 2200 tons for the Northern Life Insurance Building at Seattle; 4000 tons for the Capwell Store at Oakland, Cal., and 500 tons for a plant at Tacoma, Wash., for the Union Bag Co. Imports of structural shapes in October totaled 2041 tons, compared with 2482 tons for September. Of this total, 1417 tons was delivered in the San Francisco district. Prices on domestic material remain firm at 2.35c., c.i.f. Coast ports.

Plates.—The Steel Tank & Pipe Co. of Oregon was awarded 600 tons of 20 to 30 in. riveted pipe for the Port Townsend, Wash., pipe line. Another 400 tons may be placed unless wood stave pipe is decided upon. The only other award was booked by the Pacific Coast Engineering Co., Oakland, for 175 tons for 20 in. pontoon pipe for the U. S. Engineers' Office, San Francisco. The only pending project of importance is the Petroleum Securities Co.'s inquiry for oil storage tanks for its new Richmond plant. From 700 to 2500 tons of material is involved, depending upon the number and size of the tanks. An award is expected soon. Prices appear to be uniform at 2.25c., c.i.f.

Bars.—Imports of bars, both merchant and reinforcing, for October aggregated 1316 tons, compared with 4822 tons for the previous month. Of this total, Los Angeles took 854 tons and San Francisco 404 tons. One of the largest reinforcing bar awards placed during the past year was booked by the Bethlehem Steel Co. and called for 8500 tons for the Coyote Point bridge across San Francisco Bay. The largest pending inquiries involve 835 tons for the North Branch Canal Project, Ellensburg, Wash., and 750 tons for the Veterans' Hospital at Portland, Ore.

Cast Iron Pipe.—Demand for cast iron pipe continues good. Awards were not heavy, but some large lots are pending. Santa Ana, Cal., placed 231 tons of 6 and 12 in. B pipe with the American Cast Iron Pipe Co.; the National Cast Iron Pipe Co. booked 350 tons of 20 in. B for Pasadena, Cal., and B. Nicoll & Co. took 129 tons of 6 and 10 in. B for Eureka, Cal. Pending business follows:

Portland, Ore., 2825 tons, 6 to 24 in. B. Bids opened.

The Dalles, Ore., 340 tons, 4 to 12 in. D. Bids Jan. 9.

Spokane, Wash., 1246 tons, 2 to 12 in. B. Bids Jan. 12.

Nogales, Ariz., 373 tons, 2 to 10 in. B. Bids opened.

El Segundo, Cal., 125 tons, 4 to 10 in. B. Bids Jan. 13.

Lynwood, Cal., 217 tons, 6 to 10 in. B. Improvement Long Beach Boulevard; O. U. Miracle, San Diego, Cal., low bidder.

Los Angeles, 401 tons, 2 to 10 in. B, County Water Works District No. 10. United States Cast Iron Pipe & Foundry Co.. low bidder.

San Diego, Cal., 155 tons, 4 to 6 in. B, improvement Boundary Street. Bids Jan. 16.

San Diego, Cal., 271 tons, 2 to 10 in. C, improvement Twenty-eighth Street. Bids Jan. 16.

San Diego, Cal., 264 tons, 2 to 6 in. C, improvement Muir Avenue. Bids Jan. 23.

San Diego, Cal., 153 tons, 6 to 10 in. B, improvement Main Street; Butterfield Construction Co., San Diego, low bidder.

Importations of cast iron pipe in October totaled 2043 tons, compared with 2301 tons for the preceding month. Los Angeles took 1182 tons of this total.

Steel Pipe.—The only inquiry of importance involves from 200 to 400 tons of 3½ to 16 in. plain-end line pipe for the Petroleum Securities Co.'s new plant at Richmond, Cal. The Grinnell Co. booked 625 tons of 8 in. seamless pipe for Los Angeles. Imports of tubular goods in October were 1533 tons, of which San Francisco took 1172 tons.

Rails.—The Western Pacific has placed 10,000 tons of 85 lb. rail with the Colorado Fuel & Iron Co. and, in addition, has placed 400,000 rail anchors, totaling about 600 tons, with various Eastern producers. No action has been taken by the Southern Pacific Co., San Francisco, on its inquiry for 28,000 kegs of track spikes and 3200 kegs of track bolts, totaling 3120 tons. This company will open bids on Jan. 10 for 880,800 tie plates, totaling close to 4500 tons.

Coke.—Demand for foundry coke reflected the same quiet condition that prevailed in the pig iron market, and sales and inquiries were limited to small lots for prompt shipment. Imports in October totaled 7658 tons. Of this total Los Angeles took 2946 and San Francisco 2916 tons. Prices continue unchanged.

Warehouse Prices, f.o.b. San Francisco

	Base per Lb.
Plates and structural shapes	3.15c.
Soft steel bars	3.15c.
Small angles, $\frac{3}{16}$-in. and over	3.15c.
Small angles, under $\frac{3}{16}$-in.	3.55c.
Small channels and tees, ¾-in. to 2¾-in.	3.75c.
Spring steel, ¼-in. and thicker	5.00c.
Black sheets (No. 24)	4.80c.
Blue annealed sheets (No. 10)	3.75c.
Galvanized sheets (No. 24)	5.35c.
Structural rivets, ½-in. and larger	5.65c.
Common wire nails, base per keg	$3.35
Cement coated nails, 100-lb. keg	3.35

Birmingham

Cold Weather Retards Foundry Operations in Alabama

BIRMINGHAM, Jan. 10.—Cold weather retarded the return of foundry operations to a normal schedule following the holidays, and this has affected the pig iron market both from the standpoint of sales and of shipments. Only a small amount of business was booked last week, although there were numerous inquiries which are expected to produce new tonnage within the next week or so. Shipments have been correspondingly low. Birmingham furnaces have sold considerable iron for the first quarter and the outlook is satisfactory. Quotations continue on a $16 base. Eighteen furnaces are in blast, the same as during the past two months.

Prices per gross ton, f.o.b. Birmingham district furnaces:

No. 2 foundry, 1.75 to 2.25 sil.	$16.00
No. 1 foundry, 2.25 to 2.75 sil.	16.50
Basic	16.00

Finished Steel.—There has been a resumption of buying since the first of the year and the outlook is favorable. Prices are unchanged. Structural steel fabricators and reinforcing bar manufacturers report only a small amount of new business, but are looking forward to an early improvement. The Tennessee company has been awarded a liberal share of the new rail and car orders and now has considerable advance tonnage in these lines as well as in miscellaneous steel lines. This company is now averaging seven open-hearth furnaces at Ensley and four at Fairfield. The Gulf States Steel Co. is operating four at Alabama City.

Cast Iron Pipe.—Judged by November and Decem-

CARNEGIE LIBRARY OF ATLANTA

ber inquiries, first quarter tonnage is expected to be of fair volume. Only a small amount of business has been placed to date. Birmingham plants obtained 2000 tons from St. Louis, the only order of any consequence. Plants have been slow in resuming operations but are now back at about the same basis as in early December. The base price is around $28.50. Inquiries for first quarter are encouraging and there have also been some for second quarter.

Coke.—There is a general improvement in foundry coke demand and shipments. Surplus stocks have been used up and foundries are back in the market. Early in December there was a curtailment of buying and shipments that continued during most of that month. There has been no change in the price, $5 per net ton.

Old Material.—Business has been slow in developing. Demand is about at the same level as in December. Prices have not changed.

Prices per gross ton, delivered Birmingham district consumers' yards:

Heavy melting steel	$10.00 to $10.50
Scrap steel rails	11.00 to 11.50
Short shoveling turnings	8.00 to 8.50
Cast iron borings	8.00 to 8.50
Stove plate	13.00 to 14.00
Steel axles	19.00 to 20.00
Iron axles	18.00 to 20.00
No. 1 railroad wrought	10.00 to 11.00
Rails for rolling	12.00 to 13.00
No. 1 cast	14.50 to 15.00
Tramcar wheels	12.50 to 13.50
Cast iron carwheels	12.00 to 13.00
Cast iron borings, chemical	13.50 to 14.00

St. Louis

Pig Iron Sales Increase—Steel Demand Is Light

ST. LOUIS, Jan. 10.—The new year made a good start in pig iron sales. Producers say that indications point to a price advance. The Granite City maker's sales for the week totaled 12,000 tons, of which about 2000 tons was basic, 750 tons malleable and the remainder foundry. The largest order was 5000 tons of foundry iron for a Southern Illinois melter. Shipments of the Granite City maker for December were the heaviest of any month last year, and its unfilled orders amount to more than 100,000 tons. A leading Southern interest sold 450 tons last week.

Prices per gross ton at St. Louis:

No. 2 fdy., sil. 1.75 to 2.25 f.o.b. Granite City, Ill.	$19.50 to $20.00
Northern No. 2 fdy., delivered St. Louis	20.66
Southern No. 2 fdy., delivered	20.42
Northern malleable, delivered	20.66
Northern basic, delivered	20.66

Freight rates: 81c. from Granite City to St. Louis; $2.16 from Chicago; $4.42 from Birmingham.

Coke.—With zero weather prevailing in St. Louis and vicinity, sales of domestic grades of coke were greatly stimulated. Buying of foundry grades is small.

Finished Iron and Steel.—Specifications against contracts for plates, shapes and bars have been light, and new business much lighter. Warehouse business is very quiet. The only inquiry before the market is from the Wabash Railroad for plates, shapes, bars and billets for the first half. The new year has brought very little for the fabricators of structural steel, who need business badly. The only award of the week was 300 tons for a pontoon for the Mississippi River Commission. A pending sewer project will require 600 tons of reinforcing bars.

Warehouse Prices, f.o.b. St. Louis

	Base per Lb.
Plates and structural shapes	3.25c.
Bars, soft steel or iron	3.15c.
Cold-finished rounds, shafting and screw stock	3.75c.
Black sheets (No. 24)	4.80c.
Galvanized sheets (No. 24)	5.25c.
Blue annealed sheets (No. 10)	3.60c.
Black corrugated sheets (No. 24)	4.50c.
Galvanized corrugated sheets	5.30c.
Structural rivets	3.75c.
Boiler rivets	3.75c.
	Per Cent Off List
Tank rivets, $\frac{7}{16}$-in. and smaller	70
Machine bolts	60
Carriage bolts	60
Lag screws	60
Hot-pressed nuts, square, blank or tapped	60
Hot-pressed nuts, hexagons, blank or tapped	60

Old Material.—Substantial tonnages of steel grades, miscellaneous rails and specialties were taken by some of the mills in the St. Louis district, and the buying movement is expected to continue, now that orders for car equipment have been placed with factors here. Dealers' stocks are said to be low. Railroad lists include: Baltimore & Ohio, 16,000 tons; Wabash, 1780 tons; Kansas City Southern, 200 tons; Ann Arbor, 130 tons; Frisco, 27 carloads, and Chicago & Eastern Illinois, 20 carloads.

Prices per gross ton f.o.b. dealers' yards and delivered St. Louis district consumers' works:

Heavy melting steel	$12.75 to $13.25
No. 1 locomotive tires	14.00 to 14.50
Heavy shoveling steel	12.75 to 13.25
Miscellaneous standard-section rails, including frogs, switches and guards, cut apart	14.50 to 15.00
Railroad springs	15.25 to 15.75
Bundled sheets	9.00 to 9.50
No. 2 railroad wrought	12.75 to 13.25
No. 1 busheling	11.00 to 11.50
Cast iron borings	10.00 to 10.50
Iron rails	13.50 to 14.00
Rails for rolling	15.50 to 16.00
Machine shop turnings	8.50 to 9.00
Steel car axles	20.00 to 20.50
Iron car axles	24.00 to 24.50
Wrought iron bars and transoms	21.00 to 21.50
No. 1 railroad wrought	11.50 to 12.00
Steel rails, less than 3 ft	16.00 to 16.50
Steel angle bars	14.00 to 14.50
Cast iron carwheels	14.25 to 14.75
No. 1 machinery cast	15.75 to 16.25
Railroad malleable	13.00 to 13.50
No. 1 railroad cast	14.00 to 14.50
Agricultural malleable	12.50 to 13.00
Relaying rails, 60 lb. and under	20.50 to 23.50
Relaying rails, 70 lb. and over	26.50 to 29.00

Canada

Canadian Steel Mills Start New Year with Good Backlogs

TORONTO, ONT., Jan. 10.—Although only a week has passed since the beginning of the year the general trend of business in iron and steel is steadily working up to the level at which it stood before the holiday season. Indications are that practically all lines of industrial enterprise will reach higher levels than in 1927. Canadian mills start the new year with unfilled orders greatly in excess of those they had at the beginning of 1927.

The Canadian Locomotive Co., Kingston, Ont., has received an order from the Alberta Government for four locomotives. Canadian mills are carrying on active campaigns for business in foreign markets. H. J. Kelly, general manager Dominion Iron & Steel Co., Sydney, N. S., announces that his company has received an order for 900 tons of steel rods for Japan. The Dominion Iron & Steel Co. started the year with 88,000 tons of orders on its books.

Pig Iron.—While the market has not yet fully recovered from the holiday recession, some improvement in sales of foundry and malleable iron is reported. Spot demand is limited and the majority of orders are for one or two car lots. About 50 per cent of the contract consumers have covered for first quarter.

Prices per gross ton:

Delivered Toronto	
No. 1 foundry, sil. 2.25 to 2.75	$23.60
No. 2 foundry, sil. 1.75 to 2.25	23.60
Malleable	23.60
Delivered Montreal	
No. 1 foundry, sil. 2.25 to 2.75	25.00
No. 2 foundry, sil. 1.75 to 2.25	25.00
Malleable	25.00
Basic	24.00
Imported Iron at Montreal Warehouse	
Summerlee	33.50
Carron	33.00

Old Material.—Consumers are holding their purchases to a minimum. Foundries are stock taking and until this has been accomplished dealers do not expect a strong demand for scrap from this source. Some buying for first quarter delivery has been done, but the majority continue to "buy as you go." Prices are unsettled and until they reach a firmer level there is little prospect of any general strengthening in demand.

Cincinnati

Order Placed for 3700 Tons of Bars—Pig Iron Dull

CINCINNATI, Jan. 10.—With many consumers having covered their first quarter requirements, while others are waiting to determine better their needs before making future commitments, the pig iron market is dull, and dealers are of the opinion that sales this month will be small. Price considerations have been of minor importance, since quotations in the last three weeks have not been altered. An Ironton, Ohio, furnace has sold two lots of foundry iron totaling 700 tons, while the Norfolk & Western and the Worthington Pump & Machinery Corporation have closed for 600 and 300 tons, respectively. Southern Ohio makers continue to quote $19, base furnace, and Lake Erie producers are asking $16.50, base furnace. Southern iron is still on the basis of $16, Birmingham, but sales have been inconsequential.

Prices per gross ton, delivered Cincinnati:

So. Ohio fdy., sil. 1.75 to 2.25	$20.89
So. Ohio malleable	$20.14 to 20.89
Alabama fdy., sil. 1.75 to 2.25	19.69
Alabama fdy., sil. 2.25 to 2.75	20.19
Tennessee fdy., sil. 1.75 to 2.25	19.69
Southern Ohio silvery, 8 per cent	26.89

Freight rates, $1.89 from Ironton and Jackson, Ohio; $3.69 from Birmingham.

Finished Material.—In practically all consuming industries there is a feeling of optimism which has helped to give a somewhat better tone to the market, despite the absence of sizable bookings. Aside from 1300 tons for the local Eighth Street viaduct and 600 tons for the building of the Cincinnati Young Women's Christian Association, both of which will be supplied by the McClintic-Marshall Co., structural steel lettings have been of small proportions. Fabricating shops in this district are operating on a curtailed basis. Sales of bars, shapes and plates have been firmly maintained at 1.80c., base Pittsburgh. In the sheet market orders have fallen off, but producers have sufficient backlogs to justify present increased operating schedules. Black sheets are being quoted at 2.90c., base Pittsburgh, blue annealed at 2.10c. and galvanized at 3.75c., but transactions at those figures have been scarce. Considerable tonnage of nails was closed previous to the enforcement of the new card of extras, so that activities at the moment, as far as new business is concerned, are light. Common wire nails continue at $2.50 per keg, base Ironton or Pittsburgh. Demand for cold-rolled bars has shown an improvement in the past week.

Reinforcing Bars.—The Jones & Laughlin Steel Corporation will supply about 3700 tons of new billet bars for the Eighth Street viaduct in this city, the largest award locally in over a year. For a municipal sewage disposal plant at Dayton, Ohio, the West Virginia Rail Co. will furnish about 1500 tons of rail steel bars. New billet bars are quoted at 1.80c., base Pittsburgh, and rail steel stock at 1.70c. to 1.75c., base mill.

Warehouse Business.—The first week of the year has brought little business to local warehouses, and jobbers do not anticipate a pickup in sales for another week. Prices are unchanged.

Warehouse Prices, f.o.b. Cincinnati

	Base per Lb.
Plates and structural shapes	3.40c.
Bars, soft steel or iron	3.30c.
Reinforcing bars	3.30c.
Hoops	4.00c. to 4.25c.
Bands	3.95c.
Cold-finished rounds and hexagons	3.85c.
Squares	4.35c.
Open-hearth spring steel	4.75c. to 5.00c.
Black sheets (No. 24)	4.05c.
Galvanized sheets (No. 24)	4.90c.
Blue annealed sheets (No. 10)	3.60c.
Structural rivets	3.85c.
Small rivets	65 per cent off list
No. 9 annealed wire, per 100 lb.	$3.00
Common wire nails, base per keg	2.95
Cement coated nails, base 100 lb. keg	2.95
Chain, per 100 lb.	7.55
	Net per 100 Ft.
Lap-welded steel boiler tubes, 2-in.	$18.00
4-in.	38.00
Seamless steel boiler tubes, 2-in.	19.00
4-in.	39.00

Coke.—Specifications and orders for by-product foundry coke have increased in the past week, much of the betterment in demand having come from automobile companies or allied industries. Cold weather also has had a stimulating effect on by-product domestic coke sales, which have been the best of the season. A large user of by-product foundry coke in Cleveland has contracted with the Ashland, Ky., maker for its coke requirements during the first half of 1928. Prices of New River and Wise County beehive coke are unchanged.

Foundry coke prices per net ton, delivered Cincinnati: By-product coke, $9.52 to $9.64; Wise County coke, $7.59 to $8.09; New River coke, $10.09 to $10.59. Freight rates: $2.14 from Ashland, Ky.; $2.59 from Wise County and New River ovens.

Old Material.—Dealers are reported to be paying slightly more for railroad scrap this month than in December. This action is supported by speculative possibilities rather than on developments indicating mill buying in the immediate future. The market has been almost devoid of transactions. The Chesapeake & Ohio will sell a small list this week.

Dealers' buying prices per gross ton f.o.b. cars, Cincinnati:

Heavy melting steel	$11.50 to $12.00
Scrap rails for melting	11.75 to 12.25
Loose sheet clippings	8.75 to 9.25
Bundled sheets	9.50 to 10.00
Cast iron borings	8.50 to 9.00
Machine shop turnings	8.00 to 8.50
No. 1 busheling	10.50 to 11.00
No. 2 busheling	7.50 to 8.00
Rails for rolling	13.00 to 13.50
No. 1 locomotive tires	13.50 to 14.00
No. 1 railroad wrought	11.00 to 11.50
Short rails	17.00 to 17.50
Cast iron carwheels	12.75 to 13.25
No. 1 machinery cast	16.00 to 17.00
No. 1 railroad cast	13.50 to 14.00
Burnt cast	8.00 to 8.50
Stove plate	9.25 to 9.75
Brake shoes	10.00 to 10.75
Railroad malleable	12.50 to 13.00
Agricultural malleable	12.00 to 12.50

Boston

Pig Iron Sales at Low Point—Some Scrap Grades Weaken

BOSTON, Jan. 10.—Pig iron sales in New England in the past week did not exceed 1200 tons, the smallest amount for any similar period in months. There is no open inquiry of importance, and the largest single order placed was one of 150 tons of No. 2X. Four or five foundries are privately negotiating for several hundred tons, but the general outlook for the next month or two is not particularly encouraging unless there is a material increase in the New England melt. Efforts of furnaces east of Buffalo to lift prices have not been very successful, because one Buffalo company is still offering No. 2 plain and No. 2X iron at $16.50 a ton, furnace, although not as actively as heretofore. Eastern

and western Pennsylvania, Virginia and Alabama iron are still bringing a premium over Buffalo and east of Buffalo iron, but sales have tapered off. Foreign iron is no longer an important factor in this market. Furnaces east of Buffalo therefore dominate New England.

Prices of foundry iron per gross ton, delivered to most New England points:

Buffalo, sil. 1.75 to 2.25	$21.41 to $21.91
Buffalo, sil. 2.25 to 2.75	21.91 to 22.41
East. Penn., sil. 1.75 to 2.25	22.65 to 23.15
East. Penn., sil. 2.25 to 2.75	23.15 to 23.65
Virginia, sil. 1.75 to 2.25	25.71
Virginia, sil. 2.25 to 2.75	26.21
Alabama, sil. 1.75 to 2.25	22.91 to 24.77
Alabama, sil. 2.25 to 2.75	23.41 to 25.27

Freight rates: $4.91 from Buffalo, $3.65 from eastern Pennsylvania, $5.21 all rail from Virginia, $6.91 to $8.77 from Alabama.

Coke.—A large demand for domestic fuel, due to cold weather, reduced the New England Coal & Coke Co.'s and Providence Gas Co.'s reserve piles. Domestic coke is $8.50 a ton at ovens. New England ovens report a small increase in the movement of foundry coke at $11.50 a ton delivered within a $3.10 freight rate zone.

Importations.—Importations of pig iron at this port in December were 643 tons of Dutch, which compares with 781 tons in November, 1927, and 1071 tons in December, 1926. Imports for 1927 aggregated 23,623 tons, contrasted with 57,534 tons in 1926 and 90,621 tons in 1925. Thus importations last year were 33,911 tons smaller than in 1926 and 66,998 tons smaller than in 1925.

Importations of ore by months last year were: January, 16,052 tons; February, 6600 tons; March, 13,527 tons; April, 13,125 tons; May, 13,650 tons; June, 8300 tons; July, 30,852 tons; August, 34,227 tons; September, 25,805 tons; October, 23,447 tons; November, none, and December, 8850 tons, a total of 194,435 tons. The slump in importations in the last two months of the year was due to the fact that the Mystic Iron Works bought Port Henry, N. Y., ore instead of foreign.

Importations of coal in December were 21,089 tons, as against 8713 in November, bringing the total for 1927 up to 66,374 tons. In addition to pig iron, ore and coal, 16,056 pieces of foreign pipe were received at Boston in 1927.

Following are the receipts of foreign pig iron at Boston by months during 1927, together with comparisons, figures in tons:

	1927	1926	1925
January	....	4,061	8,212
February	12,350	10,659	13,701
March	....	10,810	11,365
April	110	6,332	6,167
May	1,027	3,979	6,179
June	1,848	4,936	7,967
July	1,979	2,423	4,869
August	2,262	6,347	8,248
September	1,239	2,805	6,747
October	1,384	1,801	6,264
November	781	2,310	7,137
December	643	1,071	3,765
Totals	23,623	57,534	90,621

Shapes and Plates.—The Boston & Maine Railroad has announced a $6,010,000 reconstruction program made necessary by the floods of last year. Included in this total is $2,050,000 for 92 bridges, of which about a quarter will be permanent replacement structures. Owing to the open winter, fabricators are busier than usual at this time, but the major portion of their work involves small tonnages. Prices on plates and shapes remain firm at 1.80c. per lb., base Pittsburgh.

Reinforcing Bars.—Owing to the firm position taken by steel mills, the local market for reinforcing bars is stronger. The going price from stock is 2.75c. per lb. base, whereas it was 2.70c. a week ago.

Pipe.—Boston has yet to award approximately 2000 tons of pipe and fittings, bids for which were opened last month. Pawtucket, R. I., has awarded Allen & Reed, Inc., Providence, R. I., a contract for its new water system calling for approximately 700 tons of pipe. The contractor is still negotiating. Massachusetts opens bids Jan. 12 on about 400 tons of 6 to 12-in. pipe for a State hospital. Private water pipe business is good, with small lots of 4-in. pipe going at $45.10 to $46.10 a ton delivered to common Boston freight rate points, and 6 to 12-in. stock at $41.10 to $42.10. On large tonnages, however, foundries are cutting these prices, especially when competing with Southern pipe makers, who are again active in New England. The Charles H. Tenny interests are reported to have bought 2000 tons of gas pipe.

Cold Rolled Strip Steel.—Makers of cold rolled strip steel report good bookings and anticipate a satisfactory volume of sales during the next three or four months.

Mill Prices on Cold-Rolled Strip in North Atlantic States: In 1 to 3-ton lots, 3.25c. per lb., base Pittsburgh, and also, 3.25c. to 3.40c. per lb., base Worcester, Mass.

Old Material.—Business is less active than it was a month ago. Most dealers are holding material for higher prices. In contrast with such expectations, the market for some grades is weaker. Strictly No. 1 heavy melting steel, which a week ago sold as high as $9.50 a ton on cars, shipping point, today is mostly $9, with an occasional sale at $9.25. The withdrawal of a Portland, Me., rolling mill from the market has weakened prices for street car axles, while textile machinery cast is so plentiful the price has dropped about $1 a ton to $14 to $14.50 a ton, delivered. Good breakable No. 1 machinery cast is bringing $15 a ton, delivered, but ordinary grades generally go at $14. A Buffalo consumer is bidding $14.50 a ton, delivered, for railroad malleable, but that price is out of line with the New England delivered price of $13 to $13.50. Prices on pipe have an unusually wide spread. Some brokers are paying $8 to $8.50 a ton on cars, while the best others offer is $7.50 to $8. The latter price has predominated in recent transactions.

Buying prices per gross ton f.o.b. Boston rate shipping points:

No. 1 heavy melting steel	$9.00 to $9.25
Scrap rails	8.75 to 9.00
No. 1 railroad wrought	10.50 to 11.00
No. 1 yard wrought	8.50 to 9.00
Machine shop turnings	6.00 to 6.50
Cast iron borings (steel works and rolling mill)	6.00 to 6.25
Bundled skeleton, long	5.60 to 6.00
Forge flashings	6.00 to 6.50
Blast furnace borings and turnings	6.00 to 6.25
Forge scrap	6.00 to 6.50
Shafting	13.00 to 13.50
Street car axles	15.50 to 16.00
Wrought pipe (1 in. in diameter, over 2 ft. long)	7.50 to 8.00
Rails for rerolling	10.00 to 10.50
Cast iron borings, chemical	10.00 to 10.50

Prices per gross ton delivered consumers' yards:

Textile cast	$14.00 to $14.50
No. 1 machinery cast	14.00 to 15.00
No. 2 machinery cast	12.50 to 13.00
Stove plate	11.00 to 11.50
Railroad malleable	13.00 to 13.50

Buffalo

Increase in Steel Plant Operations —Pig Iron Steady

BUFFALO, Jan. 10.—Pig iron prices are holding at $17 base for foundry and $17.50 for malleable for this district. An inquiry for 4000 tons has been issued by the Baldwin Locomotive Works. A Toronto inquiry is for 1000 tons of foundry and malleable, and an inquiry from a northern New York consumer is for 500 tons of foundry. Another inquiry for 500 tons of foundry is also pending.

Prices per gross ton, f.o.b. furnace:

No. 2 plain fdy., sil. 1.75 to 2.25	$17.00
No. 2X foundry, sil. 2.25 to 2.75	17.50
No. 1X foundry, sil. 2.75 to 3.25	18.50
Malleable, sil. up to 2.25	17.50
Basic	17.00
Lake Superior charcoal	27.28

Finished Iron and Steel.—A better tone is noticeable and there has been an increase in operations. On bars,

Warehouse Prices, f.o.b. Buffalo

	Base per Lb.
Plates and structural shapes	3.40c.
Soft steel bars	3.30c.
Reinforcing bars	2.75c.
Cold-finished flats, squares and hexagons	4.45c.
Rounds	3.95c.
Cold rolled strip steel	5.85c.
Black sheets (No. 24)	4.30c.
Galvanized sheets (No. 24)	5.15c.
Blue annealed sheets (No. 10)	3.80c.
Common wire nails, base per keg	$3.65
Black wire, base per 100 lb	3.90

shapes and plates 1.90c. is holding firmly and considerable business has been placed. Increase in automobile production accounts for some of this. Operations of sheet mills are now at about 80 per cent. It is reported that 1500 tons of reinforcing bars for the Hecker-Jones-Jewell mill and elevator has been placed. A new hospital at Marcy, N. Y., will require 300 tons of reinforcing bars and 560 tons of structural steel.

Old Material.—A mill which has been restricting scrap shipments is now accepting some tonnage. The market is particularly weak for stove plate, cast scrap and the various foundry grades. There has been an increase in open-hearth furnace operation, and dealers look for steel scrap purchasing before the end of the month. Railroad lists of the Erie and New York Central, which closed last week, brought fairly good prices. Some of the dealers, short on heavy melting steel, bought this grade, paying more for it than the price obtained by them as sellers.

Prices per gross ton, f.o.b. Buffalo consumers' plants:

Basic Open-Hearth Grades	
No. 1 heavy melting steel	$14.50 to $15.00
No. 2 heavy melting steel	13.75 to 14.25
Scrap rails	13.75 to 14.25
Hydraulic compressed sheets	11.50 to 12.00
Hand bundled sheets	8.50 to 9.00
Drop forge flashings	11.50 to 12.00
No. 1 busheling	13.25 to 13.50
Heavy steel axle turnings	12.75 to 13.25
Machine shop turnings	9.00 to 9.25
Acid Open-Hearth Grades	
Railroad knuckles and couplers	15.50 to 15.75
Railroad coil and leaf springs	16.00 to 16.50
Rolled steel wheels	14.75 to 15.25
Low phosphorus billet and bloom ends	15.75 to 16.00
Electric Furnace Grades	
Heavy steel axle turnings	12.75 to 13.25
Short shoveling steel turnings	10.75 to 11.00
Blast Furnace Grades	
Short shoveling steel turnings	10.75 to 11.00
Short mixed borings and turnings	11.00 to 11.50
Cast iron borings	11.00 to 11.50
No. 2 busheling	9.00 to 9.50
Rolling Mill Grades	
Steel car axles	16.00 to 16.50
No. 1 railroad wrought	12.00 to 12.50
Cupola Grades	
No. 1 machinery cast	14.50 to 15.00
Stove plate	12.75 to 13.00
Locomotive grate bars	10.50 to 11.00
Steel rails, 3 ft. and under	16.00 to 16.50
Cast iron carwheels	14.00 to 14.50
Malleable Grades	
Railroad	15.00 to 15.50
Agricultural	15.00 to 15.50
Industrial	15.00 to 15.50

Pacific Northwest

Construction Activities Appear Promising for This Year

SEATTLE, Jan. 6 (*By Air Mail*).—The industrial outlook for the Pacific Northwest is regarded as encouraging. A large amount of State and county work, most of which will take more or less steel, is planned, while the local building outlook is quite promising, with work in prospect totaling about $15,000,000. Pulp and paper mills to be built in Washington this year will take considerable steel, one job already placed calling for 1500 tons.

Although demand for steel during the last two or three months has been light, prices have held quite steadily, except for the recent revision to meet the method of quoting now practised by the Bethlehem Steel Co., which has brought plates and shapes down about $2 a ton on a delivered basis.

Pig Iron.—Very little is doing in the local foundry trade, and only occasional small lots of pig iron are being sold. Utah basic and No. 2 foundry are quoted at $24 to $25 per gross ton, delivered Seattle.

Warehouse Prices, f.o.b. Seattle

	Base per Lb.
Plates and structural shapes	3.00c.
Soft steel bars	3.00c.
Reinforcing bars	2.90c.
Black sheets (No. 24)	4.50c.
Galvanized sheets (No. 24)	5.00c.
Blue annealed sheets (No. 10)	3.75c.
Rivets, button and cone head	5.00c.
Rivets, tank	55-5 per cent off list
Common wire nails, base per keg	$3.25
Cement coated nails, 100-lb. keg	3.25

Plates.—The local market is quiet and not much work is in sight. The water line for the new pulp mill at Port Townsend, Wash., will be two-thirds wood and one-third steel, the latter amounting to 700 tons; it was taken by the Bethlehem Steel Co. Tank plates are quoted at 2.25c. to 2.30c., Seattle.

Structural Shapes.—The largest job placed in the week was 2300 tons for two bridges for the Simpson Logging Co., one over Vance Creek and the other over the Skokomish River, both in Washington, and taken by the United States Steel Products Co. Work on which bids have gone in includes 1500 tons of shapes for the new pulp and paper mill of the Pacific Bag & Paper Co. at Tacoma, Wash., and the new Northern Life Building, 2200 tons. Plain material is 2.30c. to 2.35c., Seattle.

Bars.—Bids are expected to be asked in a week or so on about 2500 tons of reinforcing steel for the Bon Marche department store. Work pending includes about 1000 tons for the Weaver Street bridge in Seattle, 1000 tons for the Beacon Hill tunnel, Seattle, and about 700 tons for an addition to the Elks' Temple in Seattle. Reinforcing steel bars are 1.85c. to 2.25c., the price depending on the size and desirability of the order.

Sheets.—Prices are somewhat uneven, with No. 24 galvanized usually at 4.35c., No. 24 black at 3.50c. and blue annealed at 2.75c., all c.i.f. Seattle.

Hoops and Bands.—The local market is disturbed by foreign competition at prices much lower than those named by domestic mills. Domestic hoops and bands are quoted at 2.73c., Seattle.

Warehouse Business.—Local jobbers report trade as only fair, but are looking for early betterment following the inventory period, when stocks carried by consumers will have to be replenished.

Old Material.—The local scrap market is practically stagnant. The Pacific Coast Steel Co., the leading local consumer, is said to be covered for three months or longer. In the absence of sales nominal prices are as follows: Heavy melting steel, $9.50 to $10, and cast iron scrap, $12.50 to $13, delivered, Seattle.

Detroit Scrap Prices Higher; Pig Iron Shipments Larger

DETROIT, Jan. 10.—Increased buying, while not in large tonnages, has given the scrap market in this district added strength with the result that most grades registered an increase of 25c. a ton.

Automobile production is on a higher basis and pig iron shipments in the district for the month will be larger than any month since July.

Dealers' buying prices per gross ton, f.o.b. cars, Detroit:

Heavy melting and shoveling steel	$12.00 to $12.50
Borings and short turnings	9.00 to 9.50
Long turnings	7.75 to 8.25
No. 1 machinery cast	16.00 to 17.00
Automobile cast	18.00 to 19.00
Hydraulic compressed sheets	10.75 to 11.25
Stove plate	11.50 to 12.50
No. 1 busheling	9.50 to 10.00
Sheet clippings	7.50 to 8.00
Flashings	10.00 to 10.50

Navy Asks for Bids on Steel

WASHINGTON, Jan. 10.—The Bureau of Supplies and Accounts, Navy Department, has asked for bids, to be opened on Jan. 17, for 2317 tons of special treatment steel plates; 300 tons of steel shapes and 56 tons of steel flats. The plates are for use in modernizing the battleships Oklahoma and Nevada and are to be delivered to the Philadelphia and Norfolk, Va., navy yards. The shapes and flats are to be used in the construction of light cruisers Nos. 28 and 29, building at Mare Island, Cal., and Puget Sound, Wash., navy yards, where the steel is to be delivered by the bidders.

Of 2700 employees of the Commonwealth Steel Co., Granite City, Ill., 1076 have a service record with that company of from five to 25 years.

Declares Freight Rates on Crop Ends Should Be Same as for Billets

WASHINGTON, Jan. 10.—Rates on standard and less than standard lengths of square round-cornered iron and steel billets, in mixed carloads, shipped in Official Classification territory, are unduly prejudicial to the extent that they exceed the applicable commodity rates on billets weighing 150 lb. and over in carloads, according to a proposed report to the Interstate Commerce Commission by George M. Curtis, attorney-examiner. The report followed a complaint by the Carnegie Steel Co., the Illinois Steel Co. and the Interstate Iron & Steel Co., while the Donner Steel Co. and the Central Alloy Steel Corporation intervened on the side of the other producers. The question at issue related to what constituted crop ends within the meaning of the description of them in applicable commodity tariffs. The railroads, since Jan. 1, 1927, have charged the regular commodity billet rates on standard length and the fourth class less-than-carload rate on shipments of less than standard-length billets when shipped in mixed carloads, assessing the same rate for the crop ends as for iron and steel bars.

The steel companies contended that the shorter lengths are crop ends under the commodity tariff description. The railroads maintained that they are not crop ends unless the end or fishtail be left attached as a part of the short length containing usable sound billet material. The attorney-examiner said that it is apparent that the weight of the fishtail, "which is mere scrap, is relatively small as compared with the shorter lengths in the cutting of the standard billets of dimensions that will permit the forgers to separate them into usable multiple lengths. There appears to be no sound reason for shipping the usual imperfect ends as a part of the shorter lengths." The railroads also had contended that the short-length pieces of billets are not readily distinguishable in the car from iron and steel bars. The examiner declared that the complainants and interveners, in good faith, shipped the shorter lengths of billets as crop ends under their interpretation of what constituted crop ends under the provisions of the tariffs that permitted the shipment of imperfect ends with billets at billet rates and which did not specifically state that a crop end must be in whole or in part of imperfect metal.

Black & Decker Mfg. Co. Acquires Van Dorn Electric Tool Co.

The Van Dorn Electric Tool Co., Cleveland, manufacturer of portable electric tools, has been acquired by the Black & Decker Mfg. Co. of Towson, Md. Assets of the two companies are placed at $6,000,000. The Black & Decker company has specialized in the manufacture of portable electric drills and other associated tools, and has been closely connected with the automotive trade, while the Van Dorn Electric Tool Co. has built a line of electric drills, electric reamers and other similar tools to meet the demands of large industrial enterprises such as automobile factories, shipyards, locomotive shops, car shops, etc.

S. Duncan Black, president Black & Decker Mfg. Co., announces that there will be no changes in personnel or general activities of the two organizations. Included in the purchase of the Van Dorn Electric Tool Co. are the factories, complete tool equipment, inventories, land and all assets as of the date of purchase. Van Dorn electric tools of the same styles and designs will continue to be manufactured at the Cleveland plant, having the same Van Dorn identity as heretofore, and will be marketed through the existing Van Dorn sales organization and distributers. Likewise there will be no changes in the Black & Decker line of products or sales and distributing organization and each company will continue its activities as in the past.

Franklin Schneider will continue as president of the Van Dorn Electric Tool Co., and F. H. Zulauf will be vice-president and general sales manager. Lyman Bellows is sales promotion manager.

The Black & Decker Mfg. Co., whose production plants and administrative offices are at Towson, Md., have branches in 17 cities in the United States and Canada, a warehousing and distributing plant on the Pacific Coast, a manufacturing plant in Canada and a subsidiary, Black & Decker, Ltd., of Slough, Bucks, England. R. W. Procter is sales manager of the Black & Decker company, and W. C. Allen is sales supervisor.

54,000 Tons of Cast Iron Segments Ordered for Tunnel

The Mason & Hanger Co., New York contractor, which will build the Fulton Street tunnel as a part of New York's subway system, has contracted with the Bethlehem Steel Co. and the Davies & Thomas Co., the latter of Catasauqua, Pa., for 54,000 tons of cast iron segments, the order being divided equally. The contractor has also awarded to the American Bridge Co. an order for tunnel shields, amounting to about 9000 tons of fabricated plates and shapes, while 2000 tons of special bolts will be furnished by the Oliver Iron & Steel Co., Pittsburgh. Deliveries will extend over a long period as the contracting company has four and a half years in which to complete the tunnel.

C. M. Schwab Honored by Arbitration Association

Charles M. Schwab was the guest of honor at a luncheon of the American Arbitration Association at Hotel Astor, New York, Jan. 5. When a movement to promote arbitration of business disputes was launched six years ago, Mr. Schwab gave it support, although other leading business men regarded the idea as visionary. For the initial printing expenses of the association Mr. Schwab contributed $500, and a year later he gave $5,000. Since that time he has continued to give his financial support and personal influence to promote the cause of arbitration.

"I have all respect for the courts," said Mr. Schwab in addressing the gathering, which included 500 members and guests of the association, "but I feel that it takes a real business man to decide a real business dispute. I would choose some one who knew something about the business to settle a controversy, not some one who needed to be educated to know something about that business."

In commenting on the essential honesty of most business men, Mr. Schwab said: "The American business man is honest, upright and square-dealing, and I have every confidence in him and in the prosperity and peace of our country. After 50 active years in business, I have not been soured by my experiences."

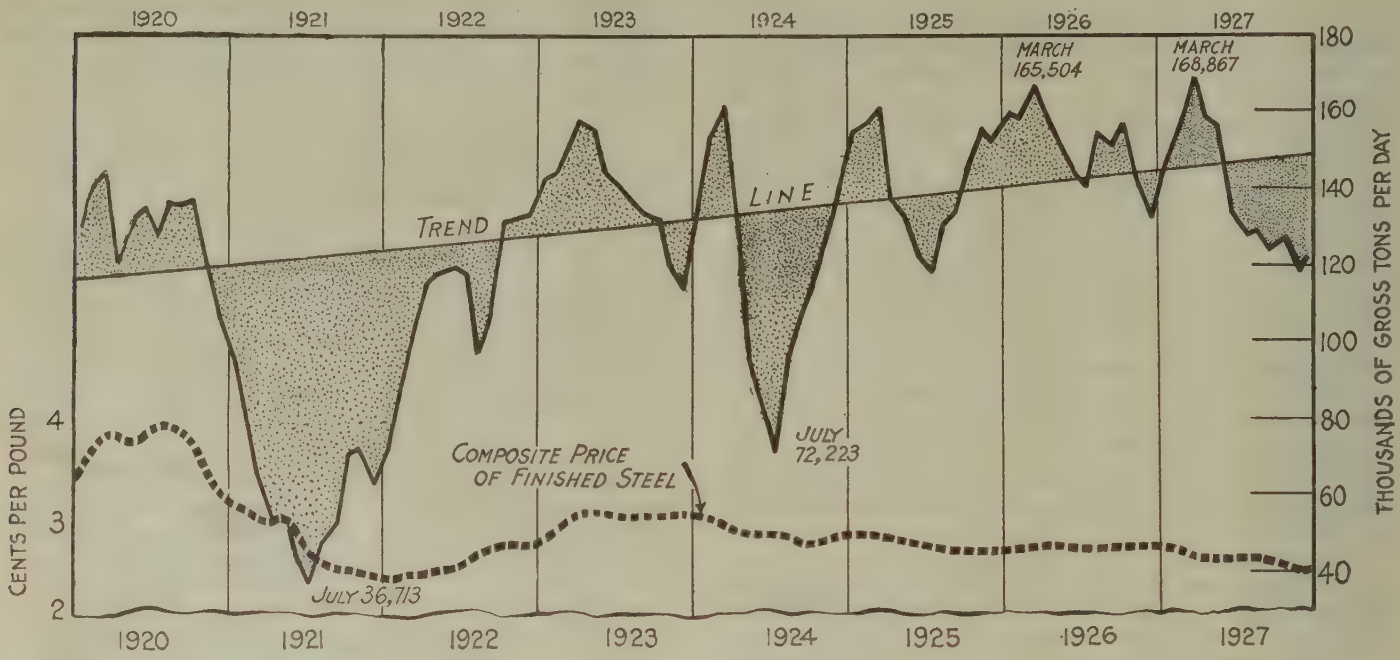
He said that he learned from Andrew Carnegie to approach life in a happy frame of mind and to seek the friendship of his fellow men. He recounted how Mr. Carnegie had received a letter from a director of his company complaining that the directors were not serious enough at board meetings. By way of reply, Mr. Carnegie, who was in Florence, Italy, at the time, sent a picture of a laughing monk to be hung in the board room. The accompanying advice was that whenever the directors felt serious-minded they should look at the picture and remember that the monk, possessing no worldly goods beyond his robe, could still laugh at life.

Mr. Schwab believes in arbitration of labor disputes, but said that in his company it had never been necessary to arbitrate, although there are provisions for doing so under the employee representation plan. In expressing his feeling of fellowship toward his workmen, he said: "The aristocracy of today is not one of birth or wealth, but is made up of those who do things for the welfare of their fellow men."

As a concluding ceremony of the luncheon, Felix M. Warburg, chairman of the board of directors of the society, presented a Commercial Peace medal to Mr. Schwab.

Production of bituminous coal in the United States in 1927 was more than 1 per cent above the average production of the five preceding years, as shown by the Bureau of Mines.

Production of Steel Ingots in December Showed Another Gain, the Third in the Second Half of 1927. It Still remains far below the line representing the calculated trend of consumption



Another Increase in Ingot Production

Daily Rate of 121,167 Tons Was 1.6 Per Cent Above November —Calendar Year, 7.7 Per Cent Under Last Year

PRODUCTION of steel ingots in the United States in December is calculated by the American Iron and Steel Institute at 3,150,345 gross tons. This is based on returns from companies which in 1926 produced 95.40 per cent of the total tonnage. With 26 working days, the December production was 121,167 tons a day. This compares with 119,299 tons in November and 126,500 tons in October, and with 133,337 tons a year ago. December was the third month in the second half of 1927 to show a gain, while the trend was steadily downward. August was 1 per cent above the daily rate of July and October was nearly 2 per cent above September. Thus the last six months showed alternate losses and gains.

For the calendar year, the calculated output is given by the institute at 43,040,916 gross tons, or an average of 138,395 tons a day. This represents a decline of 8.3 per cent below the calculated figures for 1926, which stood at 46,936,205 tons, or an average of 150,920 tons a day. This drop is reduced to 7.7 per cent when allowance is made for the electric and crucible ingot tonnage, which no longer is reported by the institute, but which was reported in 1926.

Bessemer steel showed a decline of 10.5 per cent from 1926; open-hearth steel, of 7 per cent.

Estimating production in December of electric and crucible steel ingots at 700 tons a day, the December total ingot output would appear to be about 122,000 tons a day. This is nearly 9 per cent under the figure for December, 1926. Details of the past two years are shown in the table.

Production of Steel Ingots

(Gross Tons)

	Reported by Companies Which Made 95.40 Per Cent of the Steel Ingots in 1926		Calculated Monthly Production All Companies	Approximate Daily Production All Companies

1927 Production of an American Tin Plate Plant in India

The Tin Plate Co. of India, Ltd., Golmuri works, Jamshedpur, India, made 925,000 boxes of sheared and acceptable black plate in the year 1927. This production was made with less than 1.5 Europeans per hot mill per shift, and the plant was shut down one week in the middle of the summer for a general overhauling. The above production was therefore made in 51 weeks. The plant consists of six double mills with mechanical doublers, as described in THE IRON AGE of Oct. 30 and Nov. 6, 1924, in extracts from a paper on "An American Tin Plate Plant in India," read by Frank L. Estep, New York, before the American Iron and Steel Institute.

Decline in Industrial Coal Stocks

Bituminous coal stocks in industrial hands are estimated by the National Association of Purchasing Agents to have decreased about 3,400,000 tons between Nov. 1 and Dec. 1, to a total of 55,225,000 tons, which is the lowest for any recent month. Industrial consumption during November is estimated at 35,514,000 tons, or about 1 per cent less than in October. Production of November is given at 47,100,000 tons. It is estimated that the steel mills have on hand a supply for about 55 days, the by-product coke plants and the railroads for about 41 days, electric utilities and coal-gas plants for 69 days and other industries for 47 days.

DECEMBER PIG IRON DATA

Steel-Making Iron Made Last Month—Manganese Alloy Output Expanded—Capacity Active on Jan. 1

BELOW are additions to pig iron data for December, published in THE IRON AGE Jan. 5. The amount of steel-making pig iron made last month was 1,987,652 gross tons, or 64,818 tons per day. This compares with 1,938,043 tons, or 64,600 tons per day, made in November. The total steel-making pig iron produced in 1927 was 27,345,888 tons, which is 2,725,256 tons, or about 9 per cent, less than the 30,071,144 tons made in 1926. Details are given in one of the tables.

Capacity Active on Jan. 1

Later returns show that one more furnace went out of blast in December—the Utah furnace of the Columbia Steel Corporation—bringing the number active on Jan. 1, 1928, to 169. It is estimated that the capacity of these 169 furnaces was 86,835 tons per day, as compared with 87,700 tons per day for the 170 furnaces active on Dec. 1, 1927.

Larger Ferromanganese Output

More ferromanganese was made in December than in any month since August. The total was 20,992 tons, bringing the 1927 production to 291,840 tons. This compares with 315,828 tons made in 1926. The December spiegeleisen output was also the largest since August at 6816 tons. The 1927 total was 99,368 tons, which exceeds the 1926 production of 74,096 tons by over 32 per cent.

*Includes pig iron made for the market by steel companies.

Shifting Currents in Pig Iron Imports

Imports of pig iron in November, at 16,142 tons, showed a decline of less than 9 per cent from November, 1926, in spite of the fact that imports for the 11 months ended Nov. 30 were less than 28 per cent of the corresponding total in 1926. November imports in 1927 were about one-seventh of the total for the first 11 months, whereas in 1926 the November tonnage was only one-twenty-fifth that of the 11 months.

India furnished more than half the total incoming tonnage in November, contrasted with only one-ninth of the total last year. In November, 1926, Germany furnished more than half of the total, contrasted with only a little over 2 per cent a year later. As a matter of fact, Germany's pig iron shipments reaching the United States in November, 1926, came within 10 tons of the total from Germany reaching the United States in the first 11 months of 1927.

In the 11 months India has furnished us with just under half our total imports. Netherlands has supplied almost half the remainder and Great Britain more than half that not furnished by India and Netherlands. In contrast with this, Germany led in 1926 with more than one-third the total for the first 11 months. Great Britain was second, India third, and Netherlands fourth.

Imports of Pig Iron by Countries of Origin

All other	.....	.....	97	2
Total	16,142	17,560	118,769	430,990

Shipments of electric industrial trucks and tractors in December are reported by the Department of Commerce at 96, compared with 98 in November and with 118 a year earlier. Totals for the two years were 1259 in 1927 and 1415 in 1926, showing a decline of 11 per cent. There was a drop of 188, or 14½ per cent, in domestic shipments, but a gain of 32, or 32½ per cent, in exports, which advanced from 98 to 130 units.

FABRICATED STRUCTURAL STEEL

Year's Business Opens With 44,500 Tons of Awards and 45,500 Tons of New Projects

Business for the year has begun with a good tonnage of both awards and new projects. A total of 44,500 tons is reported closed in the past week and new projects call for about 45,500 tons. One of the largest contracts placed was 9000 tons for the Fulton Street tunnel in New York. Among the larger inquiries is 7800 tons for a subway section in the Bronx, New York, and 8000 tons for a building in Chicago. Awards follow:

Thomaston, Me., 150 tons, Lawrence Cement Co. plant unit, to New England Structural Co.

Lawrence, Mass., 400 tons, two Boston & Main Railroad bridges, to Boston Bridge Works, Inc.

Somerville, Mass., 400 tons, high school addition, to Boston Structural Steel Co., Inc.

Cambridge, Mass., 100 tons, garage for Windshield Co., to New England Structural Co.

Boston, 500 tons, North Station, to American Bridge Works.

State of Vermont, 300 tons, three State bridges, to Standard Engineering & Construction Co., Toledo.

New York, 19,270 tons reported to the Structural Steel Board of Trade; 11,920 tons in the following awards not previously reported: Apartment buildings at 118 East Fortieth Street, at Fifty-fifth Street and First Avenue and at 440 West Thirty-fourth Street, to Paterson Bridge Co.; West Thirty-sixth Street station of New York Edison Co., to Levering & Garrigues Co.; Neurological Institute on Fort Washington Avenue and school on Reservoir Avenue, to Hedden Iron Construction Co.; babies' hospital at Broadway and 168th Street, to A. E. Norton, Inc.; apartment buildings at 141 West Seventy-ninth Street, 136 East Seventy-ninth Street, 1070 Park Avenue, 3 East Eighty-fourth Street, 323 East Forty-third Street and on Montgomery Place in Brooklyn, business building at 142 West Fifteenth Street, garage at 2236 Nostrand Avenue in Brooklyn and building at Greenspoint Avenue and Queens Boulevard, to Harris Structural Steel Co.; boiler house for Brooklyn Edison Co. on Hudson Avenue, Brooklyn, factory building in Columbia Heights, Brooklyn, high school at Oyster Bay, L. I., ice storage building at 512 West Nineteenth Street and school at Forest Hills, L. I., to McClintic-Marshall Co.; Masonic Temple at Forest Hills, laundry building on Seventh Avenue, Brooklyn, and theater at 243 West Forty-seventh Street, to George A. Just Co.

New York, 9000 tons, Fulton Street tunnel, reported let to American Bridge Co.

New York, 2500 tons, commerce building for College of the City of New York, to an unnamed fabricator.

Perth Amboy, N. J., 150 tons, factory building, to Belmont Iron Works.

Philadelphia, 500 tons, building for Broad Street Trust Co., to Montgomery Iron & Steel Co.; reported last week to an unnamed fabricator.

Dover, N. J., 110 tons, viaduct for State Highway Commission, to Fort Pitt Bridge Works.

State of New Jersey, 115 tons, highway bridges, to Bethlehem Steel Co.

Philadelphia, 100 tons, building for Quaker City Iron Works, to Belmont Iron Works.

Harrisburg, Pa., 1750 tons, North office building, to Lehigh Structural Steel Co.

Chicago, 1800 tons, addition to Illinois Bell Telephone Co. building, to Hansel Elcock Co.

State of Vermont, 350 tons, two highway bridges, to Shoemaker Bridge Co.

Southern Railway, 100 tons, bridges, to Virginia Bridge & Iron Co.

Hopewell, Va., 300 tons, building for Atmospheric Nitrogen Co., to Virginia Bridge & Iron Co.

Nazareth, Pa., 180 tons, pack house for Nazareth Cement Co., to Bethlehem Construction Co.

State of Texas, 1000 tons, tanks for Standard Oil Co. of New Jersey, to an unnamed fabricator.

Memphis, Tenn., 300 tons, pontoons for Mississippi River Commission, to Mississippi Valley Structural Steel Co.

Cincinnati, 1300 tons, Eighth Street viaduct, to McClintic-Marshall Co.

Cincinnati, 600 tons, building for Young Women's Christian Association, to McClintic-Marshall Co.

Cleveland, 230 tons, garage for Cleveland Railway Co., to Austin Co.

Pomeroy, Ohio, 1000 tons, bridge over Ohio River, to Mount Vernon Bridge Co., Mount Vernon, Ohio.

Duluth, Minn., 700 tons, additions and improvements for Zenith Furnace Co., to Lackawanna Structural Steel Co., Buffalo.

St. Paul, Minn., 1000 tons, Cedar Avenue bridge, to Crown Iron Works, local.

Chicago, Rock Island & Pacific, 500 tons, two bridges, to American Bridge Company.

LaCrosse, Wis., 400 tons, Hunter's bridge over Black River, to George E. Palmer Co., Minneapolis.

Seattle, 2100 tons, two bridges over Vance Creek and Snohomish River for Simpson Logging Co., to United States Steel Products Co.

Port Townsend, Wash., 2800 tons of steel plates for city water line, to Steel Tank & Pipe Co.

Foss, Ore., 350 tons, railroad logging bridge for Hammond Lumber Co., to Wallace Bridge & Structural Steel Co.

San Francisco, 175 tons plates, pontoon pipe for United States Engineer Office, to Pacific Coast Engineering Co.

San Francisco, 125 tons, apartment building, Hermann and Buchanan Streets, to Golden Gate Iron Works.

San Francisco, 130 tons, apartment building, California and Broderick Streets, to Central Iron Works.

San Francisco, 118 tons, apartment building, Pine and Hyde Streets, to Central Iron Works.

Los Angeles, 150 tons, Shaber Cafeteria building, 618 South Broadway, to Union Iron Works.

Long Beach, Cal., 1100 tons, apartment building, Ocean Boulevard, to McClintic-Marshall Co.

Bakersfield, Cal., 200 tons, hangars for Kern County, to Western Pipe & Steel Co.

Structural Projects Pending

Inquiries for fabricated steel work include the following:

White River Junction, Vt., 1700 tons, bridge.

Cambridge, Mass., 175 tons, Third Street bridge.

Fitchburg, Mass., 200 tons, theater and stores.

Stamford, Conn., 125 tons, service station.

Scarsdale, N. Y., 225 tons, school.

New York, 7800 tons, section 1, route 106, subway in Bronx; bids close Jan. 27.

New York, 1400 tons, office building at Broadway and Fourteenth Street.

New York, 1000 tons, theater at Third Avenue and Fifty-eighth Street.

New York, 725 tons, business building at Third Avenue and 189th Street.

New York, 350 tons, loft building at 427 West Fifty-fourth Street.

New York, 200 tons, office building at Sedgwick Avenue and 167th Street.

New York, 100 tons, bank building at Ninth Street and Sixth Avenue.

East Orange, N. J., 1000 tons, apartment building.

Philadelphia, 500 tons, Northeast Title & Trust Co. building.

New York Central Railroad, 2000 tons, bridge at South Bend, Ind.

Rochester, N. Y., 700 tons, high school.

Detroit, 4000 tons, Detroit-Windsor tunnel.

Marcy, N. Y., 560 tons, United States hospital; Felton Construction Co. low bidder.

Marinette, Wis., 500 tons, Chandler-Ogden bridge connecting with Menominee, Mich.; Klug & Smith Co., Milwaukee, engineer.

Chicago, 3000 tons, Willoughby Building, Madison Street and Michigan Avenue.

Chicago, 1800 tons, addition to Illinois Bell Telephone Co. building.

Chicago, 3000 tons, addition to Drake Hotel.

Chicago, 8000 tons, Forman Building; Graham, Anderson, Probst & White, architects.

St. Louis, 500 tons, Arsenal Street viaduct.

Chappell, Tex., 500 tons, highway bridge.

Quanah, Tex., 500 tons, power house for Lake Paulina Power Co.

Stege, Cal., 110 tons, plant for Western Industries Co.; bids opened.

Seattle, 2200 tons, Northern Life Insurance Building; bids opened.

Tacoma, Wash., 500 tons, plant for Union Bag & Paper Co.; bids being received.

Tacoma, 1500 tons, for Pacific Bag & Paper Co.

Ellensburg, Wash., 155 tons, Kittitas Main Canal, United States Bureau Reclamation; bids Feb. 10.

Port Townsend, Wash., 400 tons plates, additional, for pipe line.

NON-FERROUS METAL MARKETS

The Week's Prices

Cents per Pound for Early Delivery

	Jan. 10	Jan. 9	Jan. 7	Jan. 6	Jan. 5	Jan. 4

Electrolytic copper, N. Y.*	13.87½	13.87½	13.87½	13.87½	13.87½	13.87½
Straits tin, spot, N. Y.	56.12½	56.75	....	56.50	56.62½	57.37½
Lead, New York	6.50	6.50	6.50	6.50	6.50	6.50
Lead, St. Louis	6.30	6.30	6.30	6.30	6.30	6.30
Zinc, New York	6.00	6.02½	6.00	6.00	6.00	6.00
Zinc, St. Louis	5.65	5.67½	5.65	5.65	5.65	5.65

*Refinery quotation; delivered price ¼c. higher.

NEW YORK, Jan. 10.—Thus far this year the markets have been generally quiet but firm. A spurt of buying appeared in copper last week, but the market has turned quiet again, with prices steady. Tin quotations are lower, with buying fairly good. The lead market is quiet and unchanged. Demand for zinc is very light, but prices remain steady.

Copper.—Late last week a fair demand for electrolytic copper sprang up, particularly from abroad, and as a result the market was firmly established on a basis of 14.12½c., delivered in the Connecticut Valley. Practically no metal is available below this level. Domestic demand was better last week, but thus far this week inquiry and buying have been light and the market is very quiet. The quotation for Copper Exporters, Inc., is unchanged at 13.50c., c.i.f., usual European ports. Lake copper is quiet but firm at 14.25c., delivered.

Tin.—Sales for the week ended Saturday, Jan. 7, were fairly good, amounting to about 1100 tons. Friday was probably the best day at 350 tons, with 150 tons sold on Saturday. Purchases were confined largely to two or three consumers. Fair buying by one consumer on Thursday, Jan. 5, was followed by purchases from another on Friday and Saturday. Dealers left the market almost entirely alone, and the rank and file of consumers were uninterested. Yesterday, Monday, the market was stagnant, with about 100 tons sold, and today it was also very quiet, with spot Straits tin quoted at 56.12½c., New York. London quotations today were: Spot standard, £254 10s; future standard, £254, and spot Straits, £254 10s. The Singapore price was £260 5s.

Lead.—Demand is very light and producers are not inclined to force the market. The quotation of the leading interest is continued unchanged at 6.50c., New York, as its contract price, and independent producers are quoting 6.30c. to 6.32½c., St. Louis.

Zinc.—Buying of prime Western zinc is very moderate and the market is exceedingly quiet but very steady, with quotations holding fairly firm at 5.65c., St. Louis, or 6c., New York, for early delivery. There is a slight premium for future positions. Ore at Joplin is quoted at $35, with production and sales about 7000 tons each last week.

Nickel.—Wholesale lots of ingot nickel are quoted at 35c., with shot nickel at 36c. and electrolytic nickel at 37c. per lb.

Antimony.—Chinese metal for all positions is quoted at 11.25c., New York, duty paid.

Non-Ferrous Metals at Chicago

CHICAGO, Jan. 10.—Sales are moderately active except in tin and zinc. Prices for tin are off 1c. and antimony has advanced. The old metal market is quiet and prices are unchanged.

Prices, per lb., in carload lots: Lake copper, 14.25c.; tin, 58c.; lead, 6.40c.; zinc, 5.75c.; in less-than-carload lots, antimony, 12.50c. On old metals we quote copper wire, crucible shapes and copper clips, 10c.; copper bottoms, 9c.; red brass, 9c.; yellow brass, 6.75c.; lead pipe, 5c.; zinc, 3.50c.; pewter, No. 1, 34c.; tin foil, 43.50c.; block tin, 52c.; aluminum, 12.50c.; all being dealers' prices for less-than-carload lots.

Metals from New York Warehouse

Delivered Prices Per Lb.

Tin, Straits pig	58.00c. to 59.00c.
Tin, bar	60.00c. to 61.00c.
Copper, Lake	15.25c.
Copper, electrolytic	15.00c.
Copper, casting	14.25c.
Zinc, slab	7.25c. to 7.75c.
Lead, American pig	7.65c. to 8.65c.
Lead, bar	9.90c. to 10.90c.
Antimony, Asiatic	13.00c. to 13.50c.
Aluminum No. 1 ingot for remelting (guaranteed over 99 per cent pure)	27.00c. to 28.00c.
Aluminum ingots, No. 12 alloy	26.00c. to 27.00c.
Babbitt metal, commercial grade	30.00c. to 40.00c.
Solder, ½ and ½	39.25c. to 40.25c.

Metals from Cleveland Warehouse

Delivered Prices Per Lb.

Tin, Straits pig	63.75c.
Tin, bar	65.75c.
Copper, Lake	15.25c.
Copper, electrolytic	15.25c.
Copper, casting	14.50c.
Zinc, slab	7.75c.
Lead, American pig	7.25c.
Antimony, Asiatic	16.00c.
Lead, bar	9.50c.
Babbitt metal, medium grade	19.75c.
Babbitt metal, high grade	67.75c.
Solder, ½ and ½	37.75c.

Rolled Metals, f.o.b. Chicago Warehouse

(Prices Cover Trucking to Customers' Doors in City Limits)

	Base per Lb.
Sheets—	
High brass	18.75c.
Copper, hot rolled	22.75c.
Copper, cold rolled, 14 oz. and heavier	25.00c.
Zinc	11.00c.
Lead, wide	9.75c.
Seamless Tubes—	
Brass	25.12½c.
Copper	26.00c.
Brazed Brass Tubes	26.75c.
Brass Rods	16.50c.

Non-Ferrous Rolled Products

Mill prices on bronze, brass and copper products have not changed since the revision of Dec. 5. There has been no change in the zinc and lead full sheet prices since Aug. 5 and Dec. 1, respectively.

List Prices, Per Lb., f.o.b. Mill

On Copper and Brass Products, Freight up to 75c. per 100 Lb. Allowed on Shipments of 500 Lb. or Over

Sheets—	
High brass	18.75c.
Copper, hot rolled	22.75c.
Zinc	10.00c.
Lead (full sheets)	10.00c. to 10.25c.
Seamless Tubes—	
High brass	23.62½c.
Copper	24.50c.
Rods—	
High brass	16.50c.
Naval brass	19.25c.
Wire—	
Copper	15.75c.
High brass	19.25c.
Copper in Rolls	21.75c.
Brazed Brass Tubing	26.75c.

Aluminum Products in Ton Lots

The carload freight rate is allowed to destinations east of Mississippi River and also allowed to St. Louis on shipments to destinations west of that river.

Sheets, 0 to 10 gage, 3 to 30 in. wide	33.00c.
Tubes, base	42.00c.
Machine rods	34.00c.

Rolled Metals from New York or Cleveland Warehouse

Delivered Prices, Base Per Lb.

Sheets—	
High brass	18.50c. to 19.25c.
Copper, hot rolled	22.75c. to 23.75c.
Copper, cold rolled, 14 oz. and heavier,	25.25c. to 26.25c.
Seamless Tubes—	
Brass	23.37½c. to 24.37½c.
Copper	24.50c. to 25.50c.
Brazed Brass Tubes	26.50c. to 27.50c.
Brass Rods	16.25c. to 17.25c.

From New York Warehouse

Delivered Prices, Base Per Lb.

Zinc sheets (No. 9), casks	10.50c. to 11.00c.
Zinc sheets, open	11.00c. to 11.25c.

REINFORCING STEEL

More Than 21,000 Tons of Awards and About 6000 Tons of Bars In New Projects

In the total of 21,300 tons of awards in the past week, those outstanding were 8500 tons for the Coyote Point bridge across San Francisco Bay and 3700 tons for the Eighth Street viaduct in Cincinnati. Only two of the new projects, totaling close to 6000 tons, call for as much as 1000 tons. A bridge and a tunnel, both in Seattle, will take 1000 tons each. Awards follow:

Ocean City, N. J., 713 tons, boardwalk, to Truscon Steel Co.

Camp Devens, Mass., 500 tons, two battalion buildings, to Bancroft & Martin Rolling Mill Co.

Providence, R. I., 150 tons, jewelry manufacturing plant, to Truscon Steel Co.

Pittsburgh, 160 tons, warehouse for Donaldson Transfer & Storage Co., to Electric Welding Co.

Cincinnati, 3700 tons, Eighth Street viaduct, to Jones & Laughlin Steel Corporation.

Dayton, Ohio, 1500 tons, municipal sewage disposal plant, to West Virginia Rail Co.

Cincinnati, 125 tons, Linwood School, to Pollak Steel Co.

New Orleans, 200 tons, port of New Orleans, additions to wharves, to Connors Steel Co., Birmingham.

Chicago, 500 tons of rail steel bars, Providence High School, to Calumet Steel Co.

Chicago, 150 tons, Washington Park distribution station for Commonwealth Edison Co., to Concrete Steel Co.

Chicago, 200 tons of rail steel, Powhattan Hotel, to Inland Steel Co.

Milwaukee, 126 tons, University extension building, to Concrete Steel Co.

Milwaukee, 290 tons, Lincoln High School, to Concrete Steel Co.

Chicago, 170 tons of rail and billet steel bars, garage building on Howard Street, to Olney J. Dean & Co.

Denver, Colo., 285 tons, Bureau of Reclamation at Denver, United States Department of Interior (believed to be for use at Orland, Cal.), to Laclede Steel Co.

San Francisco, 8500 tons, Coyote Point bridge across San Francisco Bay, to Bethlehem Steel Co.

Oakland, Cal., 100 tons, mausoleum, Mount View Cemetery, to San Francisco jobber.

Seattle, 150 tons for Queen Anne High School, to Northwest Rolling Mills, Inc.

Seattle, 100 tons for bridge work, to Northwest Rolling Mills, Inc.

Reinforcing Bars Pending

Inquiries for reinforcing steel bars include the following:

New York, 120 tons, foundations for State office building at Center, Leonard, Baxter and Worth Streets; bids closed Jan. 10.

Philadelphia, 146 tons, building for La Salle College.

Philadelphia, 775 tons, building for Quaker City Cold Storage Co.; bids in.

Buffalo, 150 tons each, bridges at Bailey Avenue and Buffalo Creek; bids in.

Marcy, N. Y., 300 tons, United States hospital; Felton Construction Co., Buffalo, low bidder.

Chicago, 500 tons, warehouse for Meyer-Marvis.

Evanston, Ill., 100 tons, Pembridge Hotel.

Grafton, Wis., 120 tons, Milwaukee River bridge; bids close Jan. 31.

Old Metals, Per Lb., New York

The buying prices represent what large dealers are paying for miscellaneous lots from the smaller accumulators and the selling prices are those charged consumers after the metal has been properly prepared for their use.

	Dealers' Buying Prices	Dealers' Selling Prices
Copper, heavy crucible	12.00c.	13.50c.
Copper, heavy and wire	11.50c.	12.875c.
Copper, light and bottoms	9.75c.	11.00c.
Brass, heavy	7.00c.	8.50c.
Brass, light	6.00c.	7.50c.
Heavy machine composition	9.50c.	10.75c.
No. 1 yellow brass turnings	7.75c.	8.75c.
No. 1 red brass or composition turnings	8.75c.	9.75c.
Lead, heavy	5.25c.	5.625c.
Lead, tea	4.25c.	4.75c.
Zinc	3.75c.	4.25c.
Sheet aluminum	12.75c.	14.50c.
Cast aluminum	12.75c.	14.50c.

St. Louis, 600 tons, 350 tons rail and 250 tons billet steel, Arsenal Street viaduct over River Des Peres; Board of Public Service to open bids Jan. 17.

Seattle, 1000 tons, Weaver Street bridge.

Seattle, 1000 tons, Beacon Hill tunnel.

Seattle, 700 tons, Elks' Temple.

Seattle, 110 tons, addition to high school; bids received.

Seattle, 180 tons, garage, Fifth and Virginia Streets; bids received.

Ellensburg, Wash., 118 tons, Kittitas Main Canal, United States Bureau Reclamation; bids Feb. 10.

RAILROAD EQUIPMENT

Total of 1800 Cars Bought and 1000 Under Inquiry

The Southern Railway has awarded 500 automobile box cars in addition to 5450 ordered in December. The Texas & Pacific has closed on 1000 gondola, flat and automobile cars. Pending business includes 500 gondola cars for the Central of Georgia Railway and 500 flat cars for the Union Pacific.

Great Northern is in the market for six Mallet type locomotives.

New York, Ontario & Western will buy six 4-8-4 locomotives.

Chicago Great Western is asking for prices on 50 stock car underframes and five caboose car underframes.

Union Pacific will purchase 500 flat cars, 10 dining cars and 10 coaches.

Southern Railway has ordered 500 automobile box cars from American Car & Foundry Co. These are in addition to 5450 freight cars placed late in December.

Louisville & Nashville has placed an order for 100 ballast cars with Rodger Ballast Car Co.

Texas & Pacific has ordered 500 gondola cars from Pressed Steel Car Co.; 300 flat, 200 automobile and 10 platform caboose cars from American Car & Foundry Co., and three dining and five baggage and express cars from American Car & Foundry Co.

Pacific Fruit Express has placed an order for 100 underframes with Pacific Car & Foundry Co.

Texas Co. has ordered 200 insulated 10,000-gal. tank cars from American Car & Foundry Co.

Fruit Growers Express is in the market for 480 steel underframes.

Mobile & Ohio has ordered eight six-wheel switching locomotives and five Mikado-type locomotives from American Locomotive Co.

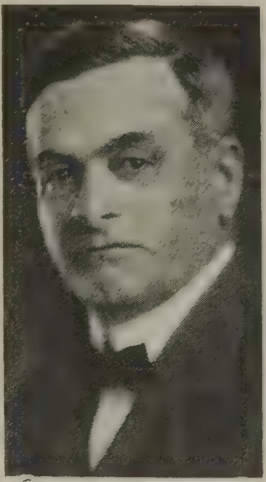
Central of Georgia Railway is in the market for 500 gondola cars.

Atchison, Topeka & Santa Fe will buy 200 underframes.

Rhode Island Industrial Safety Conference to Be Held Jan. 17

Methods for the prevention of industrial accidents in representative New England plants will be discussed at the Rhode Island Industrial Safety Conference, to be held at the Hotel Biltmore, Providence, on Jan. 17. Among the papers scheduled is one on "Relation of the Management to Accident Prevention," by Frank A. Viall, Brown & Sharpe Mfg. Co., Providence.

PERSONAL



C. D. DYER

Charles D. Dyer, for almost 25 years active in the affairs of the Shenango Furnace Co., Pittsburgh, and a well known figure in the merchant pig iron business as well as in the iron ore and Lake transportation industries, on Dec. 31 resigned as vice-president and director of the Shenango company and as a director of the Lake Carriers Association, the Lake Protective Association and the Great Lakes Towing Co. Mr. Dyer is not retiring from business, as he has several private interests to which he will devote his attention, and he will have an office at 616 Oliver Building, Pittsburgh. His leaving the interests with which he has been so closely identified for so many years, however, will be regretted by all with whom he has been associated, and the service he rendered during the war period will long be recalled. As president of the American Pig Iron Association in 1917 and 1918 and as Pittsburgh representative of the sub-committee of the American Iron and Steel Institute on pig iron, iron ore and Lake transportation, he worked in conjunction with the War Industries Board. Few were more active in the direction of pig iron production and distribution than Mr. Dyer. He was general freight agent of the Crucible Steel Co. of America in 1904, when he was selected by W. G. Park and the Union Trust Co., Pittsburgh, receivers for the Clairton Steel Co., as manager of that company. At the end of the receivership the company was taken over by the Carnegie Steel Co., and now is the Clairton works of that company. His ability in this activity attracted the attention of William P. Snyder, who had been president of the Clairton company, and with the termination of his duties as manager for the receivers, he joined the old Shenango Furnace Co., as assistant president under Mr. Snyder. When the present corporation was formed in 1906, he became vice-president and a director. He also has been secretary and a director of the Shenango Steamship Co. and will retain those offices. Besides being a director, he was a member of the executive committee of the Lake Carriers Association and the Great Lakes Towing Co. and of the advisory committee of the Lake Protective Association.

Kenneth Jensen has been appointed general manager of the Kensington Steel Co., Chicago, manufacturer of special and manganese steel castings. This is a newly created position. Mr. Jensen has had 10 years of experience in the engineering, manufacturing and selling departments of the company.

Percy C. Brooks, president of the E. N. T. Fairbanks Co., St. Johnsbury, Vt., has been elected a vice-president of Fairbanks, Morse & Co., Chicago.

Harry Dwight Smith, founder and president of Fuller & Smith, Cleveland, withdrew from the organization on Dec. 31, after an association with it of 20 years. His interests have been acquired by associates.

George W. McIntyre is in charge of a new sales office opened by the Reed-Prentice Corporation, Worcester, Mass., at 1508 New York Evening Post Building, 75 West Street, New York. He was identified for many years with the Niles-Bement-Pond Co., at New York and Chicago.

Francis J. Drago, associated in various capacities with the Jacobs Mfg. Co., Hartford, Conn., maker of chucks, in the past two years, has been made assistant treasurer of the company.

L. A. Green, formerly president L. A. Green Railway Equipment Co., Pittsburgh, has been appointed general manager of the Industrial Equipment Corporation, Carnegie, Pa.

Harry R. Patterson, for the past 15 years superintendent of the Rockdale works, American Steel & Wire Co., Joliet, Ill., has been appointed superintendent of the Rankin and Braddock, Pa., works, succeeding Edwin H. Broden, who has been appointed Pittsburgh district mill manager of the company. Mr. Patterson has been with the company for about 25 years and went to the Rockdale works from the Trenton, N. J., plant of the company.

Elmer C. Wayne, manager of the Pittsburgh office of Gould's Pumps, Inc., Seneca Falls, N. Y., has resigned and will be succeeded by John B. Foley, formerly his assistant. Mr. Wayne will become connected with the Pittsburgh office of the Massachusetts Mutual Life Insurance Co.

L. H. Waldrip has opened an office for the Driver-Harris Co., Harrison, N. J., at 7016 Euclid Avenue, Cleveland.

F. E. Flynn, manager of the strip steel departments of the Weirton Steel Co., Weirton, W. Va., has resigned to become assistant vice-president and general manager of operations for the Trumbull Steel Co., Warren, Ohio.

John Van Horne, recently in the Atlanta, Ga., office of the Lincoln Electric Co., Cleveland, has been transferred to Moline, Ill., where he will be located at 514½ Fifteenth Street, handling sales in Moline and Rock Island, Ill., and Davenport, Iowa.

Eugene D. Milener, for several years associated with the Consolidated Gas, Electric Light & Power Co., Baltimore, has been appointed industrial gas research representative for the American Gas Association, New York.

J. E. Lewis, president Harbison-Walker Refractories Co., Pittsburgh, has been elected a director of the American Arch Co., New York.

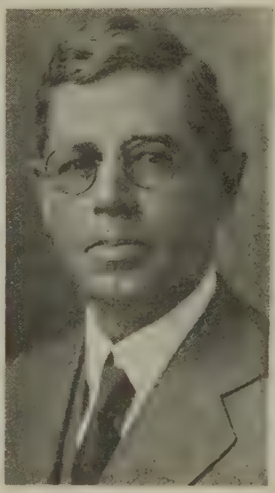
L. A. Quinn, who has been acting manager of the Birmingham, Ala., office of the Niles-Bement-Pond Co., New York, has been made sales manager in that district.

Edwin H. Broden has been appointed manager of the Pittsburgh district wire mills, American Steel & Wire Co., succeeding C. F. Blackmer, recently made general superintendent of wire mills. Mr. Broden was born in Cleveland and was graduated from the Central High School in that city, later taking special courses at Yale University. He has been with the American company and its predecessors for 33 years. He was chief draftsman H. P. Nail Co., Cleveland, from 1895 to 1898; chief draftsman and engineer in the Lake Shore district, Cleveland, from 1898 to 1901; assistant constructing engineer National Wire Corporation, New Haven, Conn., from 1901 to 1905; chief draftsman Newburgh Wire Works, Cleveland, from 1905 to 1906; chief draftsman Allentown works, Allentown, Pa., from 1906 to 1907; engineer attached to general superintendent's office, Pittsburgh, in 1907; assistant superintendent Rankin works, Braddock, Pa., from 1907 to 1913; superintendent Braddock works, Braddock, Pa., from 1913 to 1916, and superintendent Rankin works from 1916 to 1925. On Feb. 15, 1925, the Rankin and Braddock works were consolidated under one management and Mr. Broden was made superintendent, holding that position until his recent promotion. He is a member of the American Society of Mechanical Engineers and of American Iron and Steel Institute.

William Henry Harrison, formerly senior mining engineer of the United States Bureau of Mines, and later senior valuation and appraisal engineer of the Bureau of Internal Revenue, has resigned his connections with the Treasury Department and returned to private consulting practice, with offices in the National Press Building, Washington.

M. J. Schmitt, recently in charge of the Milwaukee branch of the Kearney & Trecker Corporation, Milwaukee, has been appointed assistant sales manager. He will continue to look after the Milwaukee territory and will be assisted by R. F. Shaw, who is being transferred from the Chicago branch.

George L. Pollock, vice-president and treasurer of the Burnside Steel Foundry Co., 1300 East Ninety-second Street, Chicago, resigned, Jan. 1, to become vice-president of the Nugent Steel Castings Co., 3100 South Wood Street, Chicago. He had been associated with the Burnside company since its founding. Previously he served for a time in the purchasing department of the Chicago, Burlington & Quincy Railroad and later was purchasing agent of the Wheeling & Lake Erie Railway, of the Chicago & Western Indiana Railroad and of the Belt Railway of Chicago.



G. L. POLLOCK

Horace A. Frommelt has been appointed director of personnel for the American Steel Foundries, Wrigley Building, Chicago, and much of his immediate work will be concerned with industrial training. He was for a number of years apprentice superintendent for the Falk Corporation, Milwaukee, and more recently has been engaged in consulting work at St. Louis.

W. A. Spuehler has been elected vice-president and treasurer of the Burnside Steel Foundry Co., Chicago, succeeding George L. Pollock. N. J. Finley has been named secretary of the company.

Arthur E. Hageboeck, secretary and treasurer of the Frank Foundries Corporation, Moline, Ill., was the speaker at the monthly meeting of the Wisconsin Gray Iron Research Group, held in Milwaukee on Jan. 11. His subject was "Cost Control in the Gray Iron Foundry."

A. G. Dulliver, night superintendent at the motor plant of the Chevrolet Motor Co., Flint, Mich., has been appointed superintendent of the motor division, succeeding Harry Nickerson, who has been made works manager for the Oakland Motor Car Co., at Pontiac, Mich. I. B. Smith has been named plant superintendent for the Oakland company.

Col. William A. Starrett, of Starrett Brothers, New York, will be the principal speaker at the January meeting of the Credit Association of the Building Trades of New York.

John T. Chidsey, president and general manager of the Root Co., Bristol, Conn., was recently the guest of honor at a banquet given by executives and foremen of the company, commemorating the twentieth anniversary of its present organization.

Harvey Hubbell, Jr., has been elected president and treasurer of Harvey Hubbell, Inc., Bridgeport, Conn., succeeding his father, the late Harvey Hubbell, Sr. The younger Mr. Hubbell was associated with his father in the management of the business for a number of years, and no changes in the established policies of the company are contemplated.

W. G. Guthrie has resigned as factory and production manager of the Peerless Motor Car Corporation, Cleveland, to become regional production manager for the General Motors Export Co. in Europe. He will have supervision of the company's manufacturing plants in Germany, France, Denmark, Sweden, Egypt and Spain. His headquarters will be in London. Previous to his association with the Peerless company, Mr. Guthrie was connected with the Buick and Oldsmobile divisions of the General Motors Corporation.

Earl F. Varnum, employment officer of the Commonwealth Steel Co., Granite City, Ill., has been made assistant to the general manager. He began his service with the Commonwealth company in 1910 as timekeeper and was assistant in the safety and fellowship department from Jan. 1, 1913, until May, 1915, when he was put in charge of the employment department, of which he will retain general supervision. Milton Allen, formerly assistant, succeeds him as employment officer.

Collis Johnson, sales manager for the Stockland Road Machinery Co., Minneapolis, has been appointed to a similar position for the Howard-Cooper Co., Portland, Ore.

Leonard W. Williams has retired from the pig iron firm of Park & Williams, Inc., Real Estate Trust Building, Philadelphia, and about Feb. 1 will become a partner in the firm of Stone, Williams & Kays, Philadelphia, which will deal in real estate. The firm of Park & Williams was organized in 1916 by Mr. Williams and Laird U. Park, and the latter will continue the business without change of name. The firm is sales agent for the merchant pig iron produced by the Alan Wood Iron & Steel Co., Philadelphia, and also district sales agent for the Superior Sheet Steel Co., Canton, Ohio, and the Vulcan Mold & Iron Co., Latrobe, Pa. Mr. Williams served under J. Leonard Replogle during the world war in the pig iron section of the War Industries Board.

Dr. John A. Mathews, vice-president Crucible Steel Co. of America, addressed the Indianapolis chapter of the American Society for Steel Treating on Jan. 9, his subject being "The Role of Chromium in Alloy Steels."

O. Z. Klopsch, associated with the Wolverine Tube Co., Detroit, spoke on "The Quenching of Steel" at a meeting of the Cincinnati chapter of the American Society for Steel Treating on Jan. 5.

Walter S. Hollaender has become vice-president and secretary of the Cincinnati Metal Co., Cincinnati. He was formerly connected with the Hilb Smelting Co. of that city.

J. F. Lincoln, vice-president of the Lincoln Electric Co., Cleveland, spoke before the Worcester, Mass., section of the American Society of Mechanical Engineers on Jan. 10.

Dr. Frederick C. Langenberg, vice-president Climax Molybdenum Co., New York, talked on the meaning and value of impact testing with special reference to its use in the study of nickel steels before the Boston chapter, American Society for Steel Treating, on Jan. 6.

Walter T. Noble, since 1890 superintendent of the E. D. Jones & Sons Co., Pittsfield, Mass., and associated with that concern since 1872, has resigned. He is 75 years of age. Harry M. White, assistant superintendent, who has been with the company 28 years, will succeed Mr. Noble.

Hugo W. Weimer, formerly assistant chief engineer Allis-Chalmers Mfg. Co., and later chief engineer Power & Mining Machinery Co., Milwaukee, has become affiliated with the Hunter Machinery Co., Milwaukee, in a consulting capacity, to design sand and gravel plants. The Hunter company has just been appointed exclusive agent for Wisconsin and Michigan of the Galland-Henning Co. line of screens, washers, elevators, etc., and is also representative of Sauerman drag scrapers and cableways and Northwest cranes and shovels.

—

John Gold, chief metallurgist Weirton Steel Co., Weirton, W. Va., has been appointed operating manager of the strip and stripsheet mill division, succeeding Frank E. Flynn, who resigned recently to become assistant to Charles Elliott, vice-president and general manager Trumbull Steel Co., Warren, Ohio. Mr. Flynn, before joining the Weirton Steel Co. about 10 years ago, had been with the Superior Steel Corporation, Carnegie, Pa. Mr. Gold is a graduate of Pennsylvania State College and became chief metallurgist of the Weirton company at the close of the World War.

—

Milton C. Ryer, since 1903 manager of the Denver, Colo., branch of the Crucible Steel Co. of America, resigned Jan. 1, and has taken up residence at La Jolla, Cal. He entered the employ of the Crescent Steel Co. at Denver in 1896, and when that company was taken over by the Crucible organization in 1900 he continued in the sales department of the latter company.

—

J. A. Hammond and E. R. Geib have been appointed assistant managers in charge of carbon brush and specialties sales, and illuminating carbon sales, respectively, for the National Carbon Co., Cleveland. The company has also announced the appointments of E. C. Friday, J. L. Green and V. J. Nolan as district managers in charge of the branch offices at New York, Chicago and Pittsburgh respectively, and of J. B. Collins as sales engineer in charge of the Birmingham, Ala., office.

—

L. C. Hassler, formerly chief engineer of the R. H. Beaumont Co., Philadelphia, has been transferred to the company's western headquarters in Chicago, and will devote himself to sales in that territory. William P. Alexander, who resigned from the Beaumont organization in May, 1927, has returned to the company and will be engaged in sales work in the Philadelphia, Baltimore and Washington district.

—

Alexander P. Moore, former ambassador to Spain, has been elected a vice-president of the Pittsburgh Steel Products Co., with headquarters in New York, according to an announcement by Homer D. Williams, president of the Pittsburgh Steel Co., the parent organization.

—

H. C. Baldry, vice-president Flour City Ornamental Iron Co.; George E. Buzza, president and treasurer of the Buzza Co.; T. D. Crocker, assistant general manager Northern States Power Co.; R. G. Mitchell, vice-president Dodson-Fisher Co.; W. Edward Nelson, president B. F. Nelson Mfg. Co.; G. W. Robertson, president and treasurer of the Robertson Tool Co., and S. V. Wood, president Minneapolis Electric Steel Casting Co., all of Minneapolis, have been elected directors of the Manufacturers' Association of that city.

—

S. W. Calhoun has been appointed Southeastern district representative for the Foote Brothers Gear & Machine Co., Chicago. He will have charge of sales in Tennessee, Kentucky, Virginia, North and South Carolina and southern West Virginia, with headquarters at Asheville, N. C.

—

David Pride has been appointed manager of works Superior Steel Corporation, Carnegie, Pa. Since 1918 he has been assistant general superintendent of the City mills, Carnegie Steel Co., and previously had been superintendent Lower Union mills and master mechanic Upper Union mills of the same company.

—

C. F. Blackmer, recently promoted to the general superintendency of wire mills for the American Steel & Wire Co., was the guest of his former associates of the operating and sales departments in the Pittsburgh district at a dinner given at the Union Club, Pittsburgh, on Jan. 7. Mr. Blackmer heard many expressions of esteem from those with whom he has been closely associated during the past three years, and Edwin H. Broden, who succeeds him as Pittsburgh district mill manager, presented him with a chair for his new home in Cleveland on behalf of these friends. E. A. Niven, Pittsburgh district sales agent of the company, was toastmaster.

—

Clinton M. Finney recently was elected comptroller, Warren H. Jones, secretary, and Edward J. Mulligan, assistant secretary of the Westinghouse Electric & Mfg. Co., East Pittsburgh, Pa. Mr. Finney formerly was with the Worthington Pump & Machinery Corporation, New York, of which he was comptroller from 1919 to 1926 and vice-president during the past two years. Previously he was secretary and treasurer of the Mack Truck Co. and treasurer of the George V. Cresson Co. He is a graduate of the University of Pennsylvania. Mr. Jones has been assistant secretary of the Westinghouse company since 1911 and previously was secretary to Robert Mather, former chairman of the board. Mr. Mulligan started work in the office of George Westinghouse 25 years ago and recently was secretary to James C. Bennett, lately elected a vice-president of the company.

—

George F. Anglin, for the past four years Pittsburgh manager of the Torrington Mfg. Co., Torrington, Conn., and of the Blake & Johnson Co., Waterbury, Conn., before its merger with the former concern, has joined the machinery and equipment sales department of Mackintosh-Hemphill Co., Pittsburgh. He has had 20 years of experience in various operating capacities with the Bethlehem Steel Co., Bethlehem, Pa.; the Sharon Steel Hoop Co., Sharon, Pa.; the Pittsburgh Crucible Steel Co., Pittsburgh, and the Pittsburgh Knife & Forge Co., Pittsburgh.

—

D. F. Smith, formerly assistant in the motor division of the railroad department, Erie, Pa., works, General Electric Co., has been appointed general superintendent of that plant.

—

A. H. Grayburn, assistant secretary and assistant treasurer of the Norma-Hoffmann Bearings Corporation, Stamford, Conn., has resigned, as of Dec. 31, and has become identified with the Hope Engineering & Supply Co., Mount Vernon, Ohio, and New York. A. H. Ritter, New York district manager for the Norma-Hoffmann company, goes to Stamford as assistant secretary, and will be succeeded in New York by F. W. Mesinger from the Stamford office. Norman Bell, assistant sales manager, has also been made assistant secretary. E. C. Lenon will be in charge of orders, shipments, credits and collections at Stamford.

—

E. C. Godfrey, formerly sales representative at Detroit for the Pratt & Whitney Co., Hartford, Conn., has been appointed sales manager of the Automatic Nut-Thread Corporation, 3617 North Eighth Street, Philadelphia, manufacturer of automatic nut tapping machines.

—

H. C. Woodside, long identified with the Pittsburgh Steel Co., has severed that connection to become manager of sales for the Sheet Metal Specialty Co., a subsidiary of the Follansbee Brothers Co., Pittsburgh. He will make his headquarters at the Follansbee, W. Va., plant. He was a member of the sales staff of the Pittsburgh Steel Co. in Pittsburgh from 1903 until 1921, when he resigned to become sales manager of the Northwestern Barbed Wire Co., Sterling, Ill. He retained that position until 1924 and for the next two years was engaged in the wire and heavy hardware business on his own account as head of the H. C. Woodside & Co., with headquarters in Chicago. In 1926 he returned to the Pittsburgh Steel Co. as special representative.

OBITUARY

William Banfield, a pioneer in the American tin plate and sheet steel industries and for 20 years vice-president and general manager in charge of construction and operations for the Follansbee Brothers Co., Pittsburgh, died in a Cleveland hospital on Jan. 4. He was born in Staffordshire, England, in 1854 and followed his father, who had come to this country in 1872, to work in the first tin plate mill in the United States, which was built by Rogers & Burchfield at Leechburg, Pa. From 1872 until he retired in 1924, Mr. Banfield was active in the operation of tin plate and sheet mills. He rose from heater to manager of the mill at Leechburg, which passed from its original owner to Kirkpatrick & Co. In 1885 he organized Wallace, Banfield & Co., which bought an idle mill at Irondale, Ohio, and operated it until 1894, when it was taken over by the American Tin Plate Co. For the next five years he was district manager in charge of six plants of that company. The Chester Rolling Mill Co., Chester, W. Va., which he organized in 1900, was taken over by the American Sheet Steel Co. In 1904, Mr. Banfield joined the Follansbee Brothers Co., Pittsburgh, and superintended the building of its plants at Follansbee, W. Va., and at Toronto, Ohio. He wrote a review of the American tin plate industry, which was published in THE IRON AGE, Feb. 28, 1924. Following his retirement from the steel industry, he devoted his time to private interests in and around Steubenville, Ohio.

WILLIAM BANFIELD

Samuel Howard Bell, secretary of the Warren Foundry & Pipe Corporation, 11 Broadway, New York, and assistant secretary of the Warren Foundry & Pipe Co., Wharton, N. J., died suddenly at Wharton on Jan. 9. He was associated for a number of years with the Johnstown Iron Works, Johnstown, Pa., and later with the Ingersoll-Rand Co., New York. He was secretary of the Replogle Steel Co. before that company was taken over last year by the Warren Foundry & Pipe Corporation.

Marvin Hughitt, formerly chairman of the board of the Chicago & North Western Railroad and one of the pioneer railroad builders of the West, died at his home in Lake Forest, Ill., on Jan. 6, in his ninety-first year.

Willard Brown, chief engineer of the Bourne-Fuller Co., Cleveland, died Dec. 28 after an illness of several weeks. He had been in poor health for two years. He was born in Newark, N. J., and was graduated from the Stevens Institute of Technology, Hoboken, N. J., in 1895 as a mechanical engineer. From 1896 to 1898 he served as assistant mechanical engineer for the King Bridge Co., Cleveland, and the next year as a draftsman for the Lorain Steel Co. In 1899 he became assistant chief engineer of the Dominion Iron & Steel Co., Sydney, N. S., and two years later was made superintendent of construction for the Colorado Fuel & Iron Co., Pueblo, Colo. In 1902 he became superintendent of construction for the old Garret-Cromwell Engineering Co., Cleveland, and later served five years as chief engineer of that company. In 1912 he became chief engineer of the Upson Nut Co., Cleveland, which was later taken over by the Bourne-Fuller Co. For many years he had been an active member of the Cleveland Engineering Society and had served two years as one of its directors.

Charles J. Webb, vice-president International Seal & Lock Co., Chicago, died Jan. 3, on board a liner bound for Honolulu, Hawaii.

Gustav Haarmann, president of G. Haarmann & Co., Inc., Holyoke, Mass., died in that city on Dec. 17, aged 67 years. He was born at Menden, Prussia, and went to Holyoke in 1884, where he became foreman for C. H. Bausch & Sons. In 1900 he went into the structural iron business under the name of Haarmann & Derichs, retaining that connection until the present Haarmann organization was founded in 1913.

Robert F. Devine, president of the Erie Forge & Steel Co. and the Erie Forge Co., Erie, Pa., died Jan. 3, at St. Vincent's Hospital in that city, following an operation for appendicitis. He was born at Lake Run, Pa., Sept. 17, 1860, and as a boy went to work in the coal mines near his home. Later he learned the blacksmith's trade and worked in Philadelphia, Kansas City, and in Seattle, Wash., where he started a shop of his own. In 1895 he returned to the East and became superintendent of the Frankford Steel & Forging Co., Ellwood City, Pa. He left that company in 1903 and organized a company to take over the Erie Forge Co., Ltd. In 1912, he founded the Erie Forge & Steel Co.

David Z. Norton, director of Oglebay, Norton & Co., Cleveland, iron ore miners and shippers, and formerly associated with the late E. W. Oglebay in a partnership bearing the same name, died Jan. 6, aged 77 years. He had been ill about 10 days and his death was hastened by the shock caused by the passing away of his wife, who died suddenly in New York earlier in the week. He was born in Cleveland and was graduated from Kenyon College, Gambier, Ohio. In 1868 he became a messenger for the Commercial National Bank in Cleveland and, rising rapidly, became cashier of that institution. He left the bank in 1890 to become associated with E. W. Oglebay, a pioneer in the Lake Superior iron ore industry. Oglebay, Norton & Co. was organized to succeed Tuttle, Oglebay & Co., and Mr. Oglebay took Mr. Norton into the firm as a partner to direct its financial affairs. In 1924, when the partnership was changed into an incorporated company, Mr. Norton was named as one of its directors and both he and Mr. Oglebay retired from active connection with the company. Mr. Norton was a leader in business, civic and social life of Cleveland and did much to aid the city's commercial development. He was a director of the American Shipbuilding Co., Columbia Steamship Co., Union Trust Co. and the National Refining Co., and a trustee of Western Reserve University, Adelbert College, Western Reserve Historical Society, Cleveland School of Art and Cleveland Museum of Art. He is survived by two sons and a daughter, one of the sons Robert C. Norton, treasurer of Oglebay, Norton & Co.

D. Z. NORTON

Richard J. Thomas, pioneer foundry owner of Milwaukee, died Dec. 29, aged 78 years. He established the Thomas & Yale brass foundry in 1872, and the Thomas Brass & Iron Co. in 1879. In 1915 he formed the Maas Carbonator Co., of which he was president and active head until his death.

John J. Chandler, vice-president of the Hoggson & Pettis Mfg. Co., New Haven, Conn., died at his home in that city on Dec. 18. He joined the company as an apprentice in 1881 and had served it continuously since that time.

Exports and Imports Both Increase

November Higher Than October—11-Month Total of Exports 2 Per Cent Above 1926; Imports 33 Per Cent Lower

WASHINGTON, Jan. 7.—With exports of iron and steel products for the 11 months ended with November aggregating 2,012,541 gross tons, the total for last year will reach 2,195,000 tons, if the monthly average of 182,958 tons for the 11-month period was maintained through December. As exports for the calendar year 1926 amounted to 2,167,048 tons, a moderate gain is indicated for 1927. Imports for the 11 reported months of last year totaled 686,279 tons, making a monthly average of 62,389 tons. This, if continued through December, would make a total of 749,000 tons, a sharp drop from the 1,111,090 tons imported in 1926, due largely to the decline in incoming shipments of pig iron.

Exports in November, 1927, were 177,928 tons, against 170,255 tons in October. For the 11 months the 2,012,541 tons may be compared with 1,969,022 tons for the corresponding period of 1926. Imports in November rose to 61,882 tons from 52,503 tons in October. For the 11 months the total of 686,279 tons is compared with 1,034,583 tons for the 11-month period of 1926.

Of the November exports, 71,457 tons went to Canada, representing 39 per cent of the total. For the 11 months ended with November of last year exports to Canada aggregated 769,921 tons, or 38 per cent of the total, comparing with 781,653 tons exported to Canada during the 11 months of 1926, when approximately 39 per cent of the total went to that country.

Of the imports in November 13,088 tons came from Belgium, which led all other countries. France was second with 11,693 tons and India third, with 9245 tons. Canada sent 8338 tons; Germany, 7179 tons; Great Britain, 6153 tons. In the finished lines structural shapes, with a total of 14,479 tons, represented the largest import movement in November, the greater portion coming from Belgium. Manganese ore imports for the month amounted to 26,802 tons of concentrates. This includes 63 tons of concentrates from Cuba, which now are separated, as are other manganese imports, into gross weight and concentrates.

Tin plate exports amounting to 18,121 tons were the largest of any single outgoing product in November. Japan led as the destination of tin plate exports, taking 2790 tons for the month. Canada took 2114 tons. For the 11 months tin plate exports to Japan totaled 48,942 tons, while shipments of this product to Canada amounted to 40,081 tons. Exports of casing and oil line pipe in November amounted to 6226 tons, Colombia taking 1603 tons; Soviet Russia, 647 tons; Argentina, 628 tons; Venezuela, 623 tons; and Mexico, 400 tons. Exports in November of welded black pipe amounted to 6531 tons. Japan took 1674 tons; United Kingdom, 1060 tons; Colombia, 487 tons; and Cuba, 306

Total	177,928	2,012,541	1,969,022

tons. Galvanized pipe exports totaled 2945 tons, Brazil taking 519 tons, and Cuba, 332 tons. The remainder was widely scattered to various foreign markets. Exports of steel rails in November were only 10,799 tons, of which Brazil took 4223 tons. Japan took only 67 tons. But for the 11 months Japan was the leading destination of rail exports, taking 28,560 tons, or 18 per cent of the total of 159,822 tons.

Sheet and Tin Mill Wages Decline 3 Per Cent

YOUNGSTOWN, Jan. 10.—Tonnage rates for sheet and tin mill workers in Mid-western mills decline 3 per cent to 25½ per cent above base, for January and February, following the bi-monthly settlement. The average selling price of Nos. 26, 27 and 28 gage black sheets shipped during the 60 days ended Dec. 20 was $3 per 100 lb., against $3.10 two months previously.

Coal Production of 1927 Below Previous Year

Total production of bituminous coal in the last calendar year is estimated by the National Coal Association at 519,500,000 net tons. This is within about 500,000 tons of the 1925 total of 520,053,000 tons. It represents, however, a decline of 9 per cent from the 1926 total of 573,367,000 tons. Output for the last week of the year was estimated at 7,700,000 tons, holidays accounting for a drop of more than 2,000,000 tons from the preceding week.

Decreased Imports of Iron Ore

November imports of iron ore are reported by the Department of Commerce at 199,568 gross tons. This is a reduction of nearly 29,000 tons, or 13 per cent, from the October total of 228,275 tons. It represents, however, a gain of nearly 8 per cent from November, 1926, when the total was 185,835 tons. For the 11 months ended Nov. 30 imports were 2,488,871 tons, an increase of 6 per cent over the total of 2,350,406 tons for the corresponding period in 1926. Tonnage from Cuba fell off more than 25 per cent in 1927, but the difference was more than made up by increased imports from French Africa, with a smaller increase from Chile. Spanish ore imports decreased to only one-third of last year's total, and represent but a little more than 1 per cent of the year's total. Imports from Sweden were more than five times as great as in 1926.

Sources of American Imports of Iron Ore

(In Gross Tons)

	November		11 Months Ended November	
	1927	1926	1927	1926

Electric Power Output Growing

November production of electric power by public utility power plants is reported by the United States Geological Survey at 6860 million kilowatt-hours. While this is a reduction of nearly 1 per cent from the 6928 of October, it represents a larger send-out per day than in October, and the highest daily send-out for any month in the history of the industry. September, October and November respectively have made high records in this respect, each being above the previous maximum, which was that of December, 1926. Water-power accounted for about 36 per cent of the November production, compared with 34 per cent in October and 33 per cent in September.

Plants Operated Without Lost-Time Accidents

During the month of November, 1927, the following plants of the American Sheet & Tin Plate Co., employing a total of 7448 men, conducted operations without a single lost-time accident: Aetna-Standard works, Bridgeport, Ohio; Cambridge works, Cambridge, Ohio; Dover works, Dover, Ohio; Chester works, Chester, W. Va.; Guernsey works, Cambridge, Ohio; Leechburg works, Leechburg, Pa.; Mercer works, Farrell, Pa.; roll and machine works, Canton, Ohio; Pennsylvania works, New Kensington, Pa.; Pittsburgh works, New Kensington, Pa.; Sabraton works, Morgantown, W. Va.; Scottdale works, Scottdale, Pa.; Wellsville works, Wellsville, Ohio; Gary sheet mill, Gary, Ind.

November was the fourth consecutive month during which the Gary sheet mill had no lost-time accidents.

The following plants, employing a total of 5002 men, were operated during November with only one lost-time accident: Laughlin works, Martins Ferry, Ohio; Farrell works, Farrell, Pa.; Shenango works, New Castle, Pa.; American works, Elwood, Ind.

Stock Bonus for Crane Co. Employees

Announcement has been made to the employees of Crane Co., Chicago, who have been with the firm for more than 10 years, that they are to receive one share of stock for each year of service from the private holdings of R. T. Crane, Jr. About 9000 employees will participate in the gift. A similar distribution was made by Mr. Crane in 1925. At that time $3,800,000 was distributed among 3800 employees.

"A Night for the Ladies," with the men as hosts, has been arranged jointly by the Metropolitan section of the American Society of Mechanical Engineers and the Women's Auxiliary, for the evening of Jan. 17. The meeting, which will be held at the Engineering Societies Building, New York, will be preceded by an informal dinner at the Fraternity Clubs, New York.

Machinery Exports Make Gains

November, $2,000,000 Ahead of October—11 Months, $30,000,000 More Than Last Year—Imports Higher

WASHINGTON, Jan. 7.—Making a gain of more than $2,000,000, exports of machinery in November were valued at $36,187,195, as against $33,995,216 in October. For the 11 months ended with November the value was $397,335,175, a gain of almost $30,000,000 over the corresponding period of 1926. Exports of power-driven metal-working machines in November numbered 952, valued at $1,535,322, as listed in THE IRON AGE table, comparing with 782, valued at $1,084,961, exported in October. The total value of exports of power-driven metal-working machinery in November was $2,326,537, compared with $1,274,446 in November, 1926, while for the 11 months period of each year the values were $17,987,725 and $13,113,626, respectively.

Industrial machinery exports in November, as listed by the Division of Statistics, Department of Commerce, were valued at $17,101,313, against $16,733,510 in October and $16,156,170 in November, 1926. For the 11 months ended November the value was $184,259,948, compared with $164,069,871 for the corresponding period of 1926.

Total imports of machinery and vehicles in November were $2,143,574, against $1,948,535 for November, 1926. For the 11-month periods the values were $25,481,005 and $24,013,591, respectively. Imports of industrial, office and printing machinery in November were valued at $1,246,168, against $1,156,170 in November, 1926. For the 11-month periods the values were $15,242,261 and $15,011,478. Imports of machinery listed in THE IRON AGE table were $1,315,110 in November, compared with $1,495,195 in October. For the 11 months ended with November the value was $17,188,212, compared with $16,096,841 for the corresponding period of 1926.

Belgian Mill Prices Firmer in Active Market

ANTWERP, BELGIUM, Dec. 28.—The threat of German steel mills to suspend Jan. 1, as a result of the controversy over the 8-hr. day, has brought out heavier buying than for some time. Consumers are seeking to cover their requirements for at least part of the first quarter, and mills have been able to adopt a firmer position on prices.

The fact that the International Steel Cartel has decided to make no increase in allotments for the first quarter of 1928 is expected to aid in the maintenance of prices, and, with German steel mills operating on an 8-hr. day, their costs should be slightly higher.

Russia and Bulgaria Buy German Pipe

HAMBURG, GERMANY, Dec. 26.—The Mannesmann Tube Works, which recently received an order from the Russian Government for about 51,000 tons of tubes, has been successful in booking an order from the Bulgarian Government for tubular products and street car equipment valued at about $850,000.

Machinery Exports from the United States

Quiet Rules in European Markets

British Tin Plate Mills Closed Under Tonnage Restriction Scheme—Exports Very Light

(By Cable)

LONDON, ENGLAND, Jan. 9.

WITH the holidays ended, demand for Cleveland pig iron is improving and some consumers are entering into six months' contracts. Export sales of pig iron are still poor, but some increase is noted. The Scotch pig iron trade is depressed and 10 blast furnaces have been blown out, leaving only 21 active out of 85.

Foreign ore continues quiet. Jones & Colver, Sheffield, are reorganizing financially and a receiver has been appointed on behalf of the holders of debenture bonds.

The Union of German Iron and Steel Manufacturers estimates the world pig iron output in 1927 at 84,600,000 metric tons and the steel ingot and castings production at 100,500,000 metric tons.

Tin plate is moderately active and inquiry is good, but actual sales represent only a portion of capacity, as most mills were closed all last week and some are remaining closed during the current week in compliance with the three weeks stoppage under the restriction of output plan. Galvanized sheets are quiet but prices are being maintained. Black sheets continue inactive.

Continental iron and steel markets are quiet and some products are inclined to easiness. British consumers of semi-finished material are not interested in more than small lots for prompt shipment. Export demand for finished iron and steel is poor.

German Tariff Reduced on Motor Cars but Increased on Parts

HAMBURG, GERMANY, Dec. 26.—Import duties on automobiles and motors will be reduced Jan. 1, but duties on all parts of cars and motors will be advanced on Jan. 15. This schedule affects several of the foreign assembly plants in Germany, notably those operated by American companies. The new duty on cars is 1000m. per 1000 kg. for countries, such as the United States, with which Germany has commercial treaties.

Polish Customs Regulations

Poland has reinstituted a custom regulation providing a reduction of 80 per cent from the normal tariff on machinery and apparatus not manufactured in that country but constituting the complete equipment or part of equipment for a newly established factory or its department, according to a report received by the Department of Commerce, Washington, from L. J. Cochrane, assistant trade commissioner, Warsaw. This regulation, to remain in effect until March 31, also applies to machinery or apparatus imported to reduce manufacturing costs or increase industrial production.

German Works Experiments with New Steel Process

HAMBURG, GERMANY, Dec. 26.—Considerable interest has been aroused by the report that the Hoesch Eisen und Stahlwerk, Dortmund, has begun experiments with a new process for the production of steel which will greatly reduce costs. Patents have been acquired by the Hoesch interests, and a small plant is being constructed for experimental production. Commercial output under these patents is said by the Hoesch company to depend entirely upon results of the exhaustive experiments planned.

German Alloy Steel Makers Unable to Advance Prices

HAMBURG, GERMANY, Dec. 26.—Tool and alloy steel makers recently announced an advance of 10 per cent in export prices, but this was almost immediately withdrawn because of recent price reductions by foreign competitors. A satisfactory volume of shipments to customers in the Far East and South America is reported.

British and Continental European prices per gross ton, except where otherwise stated, f.o.b. makers' works, with American equivalent figured at $4.87 per £ as follows:

Durham coke, del'd.	£0 17½s.		$4.27		
Bilbao Rubio ore*	1 0½		4.99

Machinery Markets and News of the Works

D. L. & W. ISSUES LIST

Eastern Railroad Inquires for About 30 Machine Tools

Ohio Company Buys 15 Presses for Making Automobile Stampings—Business Generally Is in Fair Volume

THE new year has started with fair promise for the machine tool trade. Business has shown no sudden spurt, but the volume of buying has been up to expectations. Many prospective buyers are still hesitant about placing orders for machines for which they have recently inquired, but in some respects sales resistance is not so marked as during the closing months of last year.

An inquiry for 30 miscellaneous machine tools has been circulated by the Delaware, Lackawanna & Western Railroad, but other roads are slow to make known their 1928 shop requirements. The Norfolk & Western has added three boring mills and several other machines to recent purchases and the Texas & Pacific has bought a radial drill and a steam hammer. The Missouri Pacific is placing orders against a recent list. Railroads in the Chicago area have given no indication yet of submitting lists to the trade for prices.

Fifteen presses totaling about $100,000 in value have been purchased by the Mullins Mfg. Co., Salem, Ohio, for use in executing a large order for automobile stampings. The Timken Roller Bearing Co., Canton, Ohio, has bought three engine lathes. The Firestone Tire & Rubber Co. and the Goodrich Tire & Rubber Co., both of Akron, Ohio, are figuring on lists of equipment. The Goodrich requirements are said to be for a Western plant. The Studebaker Corporation and the A. O. Smith Corporation are active buyers in the Chicago market.

Price advances occupy the attention of many machine tool manufacturers. Practically all planer companies have made upward revisions, while turret lathe builders have quite generally followed the lead of a Cleveland company in advancing prices about 10 per cent.

New York

NEW YORK, Jan. 10.

THE Delaware, Lackawanna & Western Railroad has distributed quite widely an inquiry listing about 30 items of miscellaneous shop equipment on which it asks for prices. Excepting the list of the Norfolk & Western, against which purchases were recently made, this is the largest railroad inquiry in the East in some months. Too little time has elapsed since the holidays to determine whether the new year will bring an increasing volume of machine tool buying. So far this month indications point to no particular change from the December rate, but there is a good deal of pending business on which action may be taken soon if improvement in general business conditions encourages manufacturers to go ahead.

Texas & Pacific Railroad has ordered a 5-ft. radial drill and a 2500-lb. steam hammer from Niles-Bement-Pond Co., and same company has sold to Southern Pacific a 300-lb. Beaudry hammer. Other sales include a 13 x 30-in. Pratt & Whitney lathe to Massachusetts Institute of Technology; Oliver disk sander to Hartford, Conn., fire department; No. 2 Pratt & Whitney jig borer to Detroit automobile company; jig borer to an electrical manufacturer in Ohio; two die sinking machines to a forging company in Massachusetts.

Columbia Air Liners, Inc., care of Charles A. Levine, 233 Broadway, New York, has purchased one-story factory at Thirty-sixth Street and Forty-eighth Avenue, Long Island City, totaling about 10,000 sq. ft. floor space, for manufacture of commercial and military aircraft. Initial production will be devoted largely to assembling. It is purposed to take over additional buildings on adjoining site for expansion.

Kent Automatic Parking Garage, Inc., 350 Madison Avenue, New York, awarded general contract to Fred T. Ley Co., 578 Madison Avenue, for a twenty-four-story service, repair and garage building on East Forty-third Street, to cost $1,600,000 with equipment. Wilbur G. Hudson Engineering Corporation, 30 Church Street, is engineer.

Poldi Steel Corporation of America, 151 Bank Street, New York, has purchased a two and one-half-story building, 45 x 100 ft., on West Eighteenth Street, and will remodel for a new storage and distributing plant.

Huntoon Ice Co., 91 Seventh Avenue, New York, filed plans for a three-story unit, 50 x 92 ft., on West Nineteenth Street, to cost about $60,000 with equipment; Russell G. Cory, 30 Church Street, architect and engineer.

Samuel Rosenblum, 51 Chambers Street, New York, architect, has plans for a five-story automobile service, repair and garage building, 100 x 108 ft., to cost approximately $200,000 with equipment.

Atlantic Gypsum Products Co., 40 Central Street, Boston, manufacturer of structural building materials, has awarded general contract to Donnell-Zane Co., 225 Broadway, New York, for a six-story plant at 150th Street and East River, to cost close to $75,000 with equipment; H. J. Brown, company engineer.

Ovens, power equipment, conveying and other machinery will be installed by the Gotham Cake Co., Long Island City, in a two-story building, totaling 17,000 sq. ft. of floor space.

Meisner & Uffner, 4197 Park Avenue, New York, architects, are drawing plans for a two-story automobile service, repair and garage building, to cost close to $200,000 with equipment.

Fire, Dec. 31, destroyed portion of storage and distributing plant of Mayer Malbin, Long Island City, N. Y., plumbing equipment and supplies, with loss estimated at $30,000.

H. Hartzberg & Son, New York, manufacturers of twisted wire brushes and brooms, have leased 20,000 sq. ft. in building at 41-45 East Eleventh Street for a new plant.

William A. Geisen, 603 East Tremont Avenue, New York, architect, has plans for a two-story automobile service, repair and garage building, to cost close to $100,000 with equipment.

Western Electric Co., 195 Broadway, New York, has awarded general contract to Karl W. Koch, Inc., 153 West Seventy-second Street, for another addition to its plant at Kearny, N. J., one story, 97 x 346 ft., to cost upward of $300,000 with equipment.

Chevrolet Motor Co., Flint, Mich., has plans for a one-story addition to its assembling plant at Bloomfield, N. J., 90 x 220 ft., to cost more than $80,000.

Board of City Commissioners, City Hall, has plans for a marine terminal on Hudson River water front, with elevating, conveying, loading and other freight-handling equipment, to cost $10,000,000; Philip Guise, City Hall, city engineer.

Board of Education, 19 Winans Street, East Orange, N. J., has filed plans for a three-story mechanical shop, with

The Crane Market

PURCHASING has been light both in overhead and locomotive cranes, but there is a fair volume of inquiry for single pieces of equipment. Pending business includes two overhead cranes for Public Service Production Co., Newark, N. J., 120-ton crane for Roseland and 65-ton crane for West Orange, N. J. New York Central Railroad has asked prices on 25-ton locomotive crane for Ohio. Among older inquiries still active are 60-ton electric and 10-ton hand power crane for E. L. Phillips & Co., 50 Church Street, New York; 40-ton locomotive crane for export to Russia, inquired for by Amtorg Trading Corporation, 165 Broadway, New York; 150-ton overhead crane for Phoenix Utility Co., 71 Broadway, New York, and two 15-ton lumber handling cranes for Franklin Lumber Co., Newark, N. J. In Chicago, A. Finkl & Sons have issued inquiry for 40-ton electric overhead crane.

Among recent purchases are:

General Electric Co., Schenectady, N. Y., six 5-ton, low headroom, three 10-ton, standard overhead cranes and four small electric traveling wall cranes for West Philadelphia, reported purchased from unnamed builders.

Limestone Products Co., Newton, N. J., 10-ton crawl-tread steam shovel from unnamed builder.

Livingston Sand & Gravel Co., Livingston, N. J., 10-ton crawl-tread locomotive crane from unnamed builder.

Arundel Corporation, Baltimore, two railroad type steam shovels with 3½ to 5-cu. yd. dippers, reported purchased from Bucyrus-Erie Co.

Rutland Railroad, Rutland, Vt., railroad steam shovel, reported purchased from unnamed builder.

Erie Railroad, New York, 15-ton overhead crane from Niles Crane Corporation.

American Smelting & Refining Co., 120 Broadway, New York, 5-ton, 39-ft. span, 3-motor overhead crane for Mexico, from Western builder.

Commonwealth Edison Co., Chicago, 50-ton, electric overhead crane for Southwest station to Western builder.

---

metal, woodworking and other departments, to cost $90,000 with equipment.

Otis Elevator Co., Eleventh Avenue and Twenty-sixth Street, New York, has plans for a one-story addition to its plant at Harrison, N. J., to cost $25,000. Bids will be asked in spring.

Merger is being arranged between Passaic Metal Ware Co., Brook Avenue, Passaic, N. J., and Consolidated Can Corporation, 189 Academy Street, Brooklyn. Both plants, it is understood, will be continued and an expansion program carried out.

Clarence D. Chamberlin, aviator, has leased space in the Elasticap Building, Twelfth Street and the Hudson River, Hoboken, N. J., for airplane manufacture, including experimental and assembling departments. Motors will be constructed by Charles B. Kirkham, with plant at Garden City, L. I., formerly chief engineer for Curtiss Aeroplane & Motor Corporation, Buffalo.

Nicholas Bernard, Inc., 166 Central Avenue, Newark, manufacturer of metal novelties and toys, has leased a portion of building of United Radio Corporation, 235-49 Elizabeth Avenue, for a new plant. It is understood that present works will be removed to new location and additional equipment installed.

Harco Steel Co., Inc., Elizabeth, N. J., has completed its shop at 1180 East Broad Street, and is installing machinery and equipment for fabrication of structural steel and ornamental iron.

Safety Carboy Holder & Truck Corporation, 78 Franklin Street, New York, has been taken over by M. Becker and will be operated as manufacturer of special type of barrel holder, tipper, rocker and incinerator.

Ever Ready Machine & Die Co., 608 Humboldt Street, Brooklyn, manufacturer of dies, jigs, tools and metal stampings, has purchased a building, 50 x 100 ft., at Collier and Newell Streets, which it will occupy in about 60 days.

Philadelphia

PHILADELPHIA, Jan. 9.

BIDS have been asked on general contract by Philadelphia Rubber Works Co., Land Title Building, Philadelphia, for an addition to plant at Oaks, Pa., to cost close to $40,000.

Philadelphia Rapid Transit Co., 810 Dauphin Street, Philadelphia, has acquired about 81 acres at Front Street and Champlost Avenue, and will use portion of site for new car repair and reconditioning shops, car barns, terminal trackage, etc.

Hydraulic Tool Shop, Island Road and Botanic Avenue, Philadelphia, has awarded contract to H. H. Wehmeyer, Inc., 509 West Cumberland Street, for a one-story machine shop addition.

Board of Trustees, Drexel Institute, Thirty-second and Chestnut Streets, Philadelphia, is considering erection of a four-story mechanical engineering building, to cost approximately $350,000 with equipment.

Ludington Philadelphia Flying Service, Inc., Atlantic Building, Philadelphia, has awarded general contract to Airport Equipment Co., Pennsylvania Building, for a one-story shop and hangar at Municipal Flying Field.

Philadelphia Electric Co., Tenth and Chestnut Streets, Philadelphia, in conjunction with Pennsylvania Power & Light Co., Allentown, Pa., has begun construction of new power substation and switching station at Plymouth Meeting, Pa., covering 45 acres, for interchange of power; transmission line to carry 220,000 volts will be built. Entire project will cost upward of $2,000,000. Philadelphia company will also complete new power substation at Westmoreland Street and Hunting Park Avenue, to cost more than $350,000 with equipment.

Association of Motorbus Owners of Philadelphia and Vicinity, and Del-Bridge Bus Association, both represented by Harold S. Shertz, Liberty Building, Philadelphia, attorney, have acquired jointly a site at Thirteenth and Filbert Streets, and will have plans drawn for a multi-story bus terminal, service and repair garage building, to cost close to $1,000,000 exclusive of land.

H. H. Ward Co., Inc., Chester, Pa., manufacturer of metal cornices, ceilings, etc., has awarded a general contract to William Provost Jr., Crozer Building, for a three-story addition, 60 x 140 ft., to cost approximately $70,000 with equipment; Ballinger Co., 105 South Twelfth Street, Philadelphia, architect and engineer.

Bellanca Aircraft Corporation, Arlington, S. I., has taken out a charter under same name in Delaware, with capital of $1,000,000, to construct and operate a plant at New Castle, about six miles from Wilmington, Del., where 350 acres has been purchased, with 1100 ft. frontage on Delaware River. Work will begin at once on initial units, to cost more than $100,000 with equipment, designed largely for assembling. It is said that present plant at Arlington will be continued for time being. New company is headed by Giuseppe Bellanca. Henry B. and Frank V. duPont, Wilmington, are interested in organization.

Lawrence Township Board of Education, Lawrenceville, N. J., plans the installation of manual training equipment in a new junior high school to cost $300,000, for which appropriation has been voted. P. E. Williams is supervising principal.

In connection with steam-operated electric generating plant at Churchtown, near Pennsville, N. J., to cost about $7,000,000, American Gas & Electric Co., 30 Church Street, New York, plans construction of a steel tower transmission line to Atlantic City, for service to Atlantic City Electric Co., an affiliated organization, to cost close to $1,000,000.

Lee Motor Co., Collegeville, Pa., recently formed by Lee Templeton and John Keyser, both of Norristown, Pa., will proceed with erection of one-story plant for manufacture of airplanes, with division for motor assembling, specializing in popular-priced units to sell for about $1,500.

Pocono Metal Mfg. Co., East Stroudsburg, Pa., manufacturer of sheet metal stampings, etc., will rebuild portion of its plant recently destroyed by fire, with loss of $25,000, including equipment.

Danville Structural Steel Co., Danville, Pa., recently acquired by Charles M. Schwab, head of Bethlehem Steel Corporation, Bethlehem, Pa., will be extended and improved under new ownership, with early resumption of production. Property comprises former Danville Structural Tubing Co. and Pennsylvania Brake Beam Works, consolidated last spring as the Danville Structural Steel Co. C. Clarence Weymouth will be in charge of operations. Carlton S. Wagner has been head of Danville company.

William Christensen Co., Inc., York, Pa., has been organized to fabricate structural steel, ornamental iron and brass and bronze products. It has taken over plant formerly operated by William Christensen and is not in market for any additional equipment.

Buffalo

BUFFALO, Jan. 9.

MANUAL training equipment will be installed by Board of Education, Genesee Building, Buffalo, in a two-story high school to cost close to $1,000,000. F. J. & W. A. Kidd, 522 Franklin Street, architects.

Twin States Gas & Electric Co., Bennington, Vt., has plans for a new power plant in vicinity of Hoosick Falls, N. Y., reported to cost in excess of $150,000, with transmission lines. Morton C. Tuttle Co., Park Square Building, Boston, is engineer.

Larrabee Truck Corporation, Binghamton, N. Y., recently formed has arranged for stock issue to total $625,000, proceeds to be used for acquisition of Larrabee-Deyo Motor Truck Co., with local plant. New company has purchased former plant of Fiat Motor Co., Poughkeepsie, N. Y., and proposes early removal to that location. Company will operate its own body-manufacturing department.

Niagara, Lockport & Ontario Power Co., Buffalo, will take over and consolidate Western New York Utilities Co., operating at Batavia, Lockport, Medina and vicinity. Plans are under advisement for expansion, including transmission line construction.

Board of Education, Municipal Building, Rochester, N. Y., is said to be planning installation of manual training department in three-story Benjamin Franklin high school to cost $2,000,000, for which bids are being asked on general contract until Feb. 23. Gordon & Kaelber, Hiram Sibley Building, are architects.

Coplan Steel Co., Ogdensburg, N. Y., is said to be arranging for a recapitalization of company, to be followed by early resumption of operations at the local mill and development of full capacity.

Board of School Trustees, District No. 1, 44 Main Street, Waterloo, N. Y., is considering installation of manual training equipment in two and three-story high school to cost $390,000; Carl C. Ade, 89 East Avenue, Rochester, N. Y., architect.

J. A. Zurn Mfg. Co., Erie, Pa., has been formed under State laws by John A. Zurn, 221 West Twenty-first Street, to take over and expand company of same name, with plant at Fourteenth and German Streets for manufacture of plumbing equipment and supplies, gas burners, etc., with capital of $300,000. Plans have been completed for an addition to cost close to $250,000 with equipment, for which Wilbur Watson & Associates, 1614 Prospect Avenue, Cleveland, are architects and engineers. Officials of new company will include John A., M. A., E. F., and C. A. Zurn.

Kendall-Lamar Corporation, Potsdam, N. Y., has been organized to succeed Ira H. Kendall in manufacture of milk handling apparatus. Plant is already established and equipped.

The Rome Brass & Copper Co., Rome, N. Y., through action of its stockholders in authorizing the transfer of 30,000 shares of preferred stock, has concluded arrangements for the purchase of the Rome Mfg. Co., also at Rome. The sale had previously been sanctioned by the stockholders of the Rome Mfg. Co. Radiators are the chief product of the Rome Mfg. Co.

Detroit

DETROIT, Jan. 9.

BIDS will soon be asked on general contract by Consolidated Paper Co., Monroe, Mich., for a four-story addition, to cost more than $350,000 with equipment. Forster & Wernert, Nicholas Building, Toledo, Ohio, are architects and engineers.

Wolverine Tube Co., 1411 Central Avenue, Detroit, manufacturer of seamless copper and brass tubing, tubing parts, etc., is considering an expansion and improvement program to cost close to $300,000.

Hudson Motor Car Co., 10617 Knodell Avenue, Detroit, is completing plans for a two-story addition, 100 x 500 ft., to cost more than $300,000 with equipment. Albert Kahn, Inc., Marquette Building, is architect and engineer.

Board of Education, Rochester, Mich., plans installation of manual training equipment in a three-story high and grade school to cost $225,000, for which bids will soon be asked on general contract. Van Leyon, Schilling & Keough, 3440 Cass Avenue, Detroit, are architects.

Michigan Carton Co., Battle Creek, Mich., manufacturer of cartons and other cardboard containers, has work under way on a one-story addition, 65 x 160 ft., to cost more than $60,000 with equipment. M. J. Morehouse, 343 South Dearborn Street, Chicago, is architect.

Lansing Ice & Fuel Co., Lansing, Mich., is planning extensions and improvements in its ice-manufacturing division, to increase capacity close to 25 per cent.

Michigan Fertilizer Co., Lansing, Mich., has work under way on a new two-story unit, 166 x 416 ft., to cost upward of $65,000 with machinery. Following completion of this building company is considering another one-story unit for sulphuric acid production, to cost close to $35,000.

Kewaunee Mfg. Co., Adrian, Mich., manufacturer of laboratory furniture and equipment, has awarded general contract to Robb & Ott, Adrian, for a one-story top addition to cost about $25,000. Headquarters are at Kewaunee, Wis.

Federal Forge Co., Lansing, Mich., is planning extensions and betterments to increase capacity for production of larger forgings.

Swift Electric Welder Co., manufacturer of butt and spot welding machines, formerly at Fort Street and Mount Elliott Avenue, Detroit, has removed to Boulevard Temple Building, West Grand Boulevard and Twelfth Street.

New England

BOSTON, Jan. 9.

THE machine tool market in this territory so far this year has shown no signs of activity. Local houses apparently have accomplished more business than those in other New England States, yet few sales were reported the past week. New inquiries are about as scarce as orders, and manufacturers negotiating for metal-working equipment late in 1927 seem to be in no hurry to resume. Industry is slowly gathering momentum, however, and the trade looks for more activity before the end of the month.

Small tool sales are at a minimum, and it is reported that unused stocks in manufacturers' hands are small.

Angle Novelty Co., 209 Lunenburg Street, Leominster, Mass., contemplates a plant addition.

Welker Hoops, Inc., Middletown, Conn., has leased former plant of Westinghouse Electric & Mfg. Co., Middletown, and will manufacture an automobile gear shift.

What Cheer Chemical Co., Grotton Avenue., Pawtucket, R. I., has plans for a new rendering plant for which handling equipment will be required. Plans are private.

Laconia Car Co., Laconia, N. H., has under consideration manufacture of small wood and steel motor boats for use with outboard motors.

Plans are nearing completion for a three and six-story technical high school, 143 x 238 ft., at Fall River, Mass. Dr. William Pritchard is chairman of school committee.

Washburn Wire Co., Phillipsdale, R. I., has taken out permit for a one-story rod mill, 108 x 135 ft., for which general contract recently was let to Austin Co., reported to cost upward of $100,000 with equipment.

American Oil Products Co., 230 Milk Street, Boston, has awarded general contract to W. F. Condon & Sons Co., 222 Putnam Avenue, Cambridge, Mass., for a one-story storage and distributing plant, with compounding department, at Somerville, Mass., 57 x 135 ft., to cost about $60,000. Monks & Johnson, 99 Chauncy Street, Boston, are architects and engineers.

Watertown Electric Co., 7 Main Street, Watertown, Boston, has plans for a two-story repair shop, with service and garage facilities, to cost about $65,000 with equipment.

Yale & Towne Mfg. Co., Stamford, Conn., manufacturer of builders' locks and hardware, hoists, etc., is having plans drawn for a three-story addition, to cost upward of $200,000 with equipment. John Gamble Rogers, 154 East Forty-sixth Street, New York, is architect. Headquarters are at 9 East Fortieth Street, New York.

Cadillac Automobile Co. of Rhode Island, Providence, has taken over property at 128-36 Broadway, and plans construction of service, repair and sales building, to cost in excess of $100,000 with equipment.

S. D. Warren & Co., 101 Milk Street, Boston, manufacturers of paper, have plans for a two-story addition to their mill at Westbrook, Me., to cost more than $75,000 with equipment.

New England Power Co., Worcester, Mass., has applied for permission to issue stock in amount of $1,700,000 for extensions and improvements, including completion of steel tower transmission line from Bellows Falls, Vt., to Pratt Junction, Mass., to cost $650,000; similar power line from Ayer to Tewksbury, Mass., on which work has begun, to cost $344,000; and completion of power substation at Pratt Junction, to cost $476,000 with machinery.

Chapman Valve Mfg. Co., Indian Orchard, Mass., has arranged for increase in capital from $1,500,000 to $3,000,000, a portion of proceeds to be used for expansion.

Samuel Marshall, Inc., 43 Tremont Street, Boston, has plans for a one-story automobile service, repair and garage building, 145 x 190 ft., at Medford, Mass., to cost approximately $100,000 with equipment.

Manchester Tool Co., Manchester, Conn., has been organized to manufacture tools, particularly reamers. It is operating a factory at 161 Adams Street.

Phelps Foundry Co., Ansonia, Conn., has been formed to manufacture brass and bronze castings. Manufacturing contracts have not yet been made.

Chromium Process Co., Waterbury, Conn., has been organized to engage in electro-deposition of chromium. It is occupying Maxim Munitions plant at Derby, Conn., and is not in need of materials or equipment.

Cincinnati

CINCINNATI, Jan. 9.

MACHINE tool builders have booked a fair number of orders in the past 10 days, although many buyers are hesitant about purchasing tools for which they have recently inquired. Many companies report that outstanding quotations total an impressive sum and if they are successful in closing a reasonable percentage, production should go ahead on at least a moderate basis. Operations of local plants have not changed much in the last month and probably will continue during the next few weeks on a restricted working schedule.

Price advances still occupy attention of many manufacturers. Practically all planer companies have made upward revisions, and builders of turret lathes have followed the lead of a Cleveland maker in increasing list prices. This decision has resulted in some business being placed prior to enforcement of new schedules, which became effective a few days ago.

Norfolk & Western Railroad has added three boring mills and several other machines to its previous purchases, and the Texas & Pacific has bought a 5-ft. Right Line radial drill and a 2500-lb. single frame steam hammer. Magor Car Co. has taken a 53-in. heavy boring mill.

Newman Mfg. Co., 418 Elm Street, Cincinnati, manufacturer of ornamental bronze, has purchased plant of Safe Cabinet Co., Norwood. Buildings, with a total floor space of 146,000 sq. ft., will be remodeled and company will remove its offices and factory to new location.

American Laundry Machinery Co., Norwood Station, Cincinnati, has purchased Perry Laundry Machinery Co., Fairhaven, Mass., for $500,000, and will consolidate with its organization. It is understood that Fairhaven plant will be maintained as a branch. Emmanuel J. Perry, heretofore head of acquired company, will become identified with purchasing interest. American company has recently acquired property at Seattle and plans erection of a new factory branch, storage and distributing plant at that place, to cost more than $45,000.

Linde Air Products Co., 30 East Forty-second Street, New York, is reported contemplating new plant at Portsmouth, Ohio, to cost more than $200,000 with machinery.

Perry Derrick Co., Dayton, Ky., manufacturer of derricks and kindred heavy machinery, has awarded general contract to C. A. Rawlings, Fort Thomas, Ky., for a three-story addition, to cost upward of $75,000 with equipment. E. C. Landberg, 9 East Fourth Street, Newport, Ky., is architect.

Steam Appliance Transit Corporation, Lexington, Ky., recently formed by John R. Humphrey, 1109 Slashes Road, and associates, with capital of $150,000, is contemplating erection of a one-story repair plant, to cost more than $50,000 with equipment.

Stimpson Computing Scale Co., Breckenridge and Logan Streets, Louisville, will build an addition to cost approximately $100,000 with equipment, and will soon take bids on general contract. O. D. Mock, 221 South Fifth Street, is architect.

City Council, Knoxville, Tenn., is considering construction of a municipal automobile service, repair and garage building, to cost upward of $75,000 with equipment; City Engineering Department, City Hall, in charge.

International Aircraft Corporation, 909 Keith Building, Cincinnati, has plans for a new plant and remodeling and improving present buildings.

Knoxville Power & Light Co., Knoxville, Tenn., is said to be planning an expansion and improvement program to cost about $1,500,000.

Thompson Grinder Co., Main and Zischler Streets, Springfield, Ohio, manufacturer of grinding equipment, etc., has awarded general contract to A. G. Samuelson for a one-story addition, to cost about $20,000 with equipment. Lloyd Zeller, Springfield, architect.

F. & A. Air-Jack Mfg. Co., Dayton, Ohio, has been organized to manufacture patented air-jacks and has a factory in operation.

St. Louis

ST. LOUIS, Jan. 9.

BIDS will be received by Board of Public Service, City Hall, St. Louis, until Feb. 1, for a one-story boiler plant for city sanitarium to cost $150,000. A. A. Osburg, City Hall, is city engineer.

Charles G. Kruckemeyer Machine & Parts Co., Minerva Avenue, has awarded general contract to Truscon Steel Co., Syndicate Trust Building, for a one-story addition to its machine shop, 55 x 170 ft., to cost about $35,000 with equipment.

Union Cooperage Co., Second and Penrose Streets, St. Louis, has plans for a two-story addition, 80 x 115 ft., to cost approximately $50,000 with equipment.

Imperial Casket Co., 1415 St. Louis Avenue, Kansas City, Mo., has awarded general contract to W. K. Martin, Dwight Building, for a new two-story plant, to cost $45,000 with equipment. W. J. Koch, Mutual Building, is architect.

Cape Silica Co., Cape Girardeau, Mo., is reported planning construction of two additional plant units, following completion of initial works now in progress. Present mill will cost close to $75,000 with machinery.

Arkansas Cold Storage Co., Little Rock, Ark., has plans for a three-story cold storage and refrigerating plant, to cost $85,000 with equipment.

City Council, Sterling, Kan., plans extensions and improvements in municipal electric light and power plant, with installation of additional equipment, to cost in excess of $40,000. Burns & McDonnell Engineering Co., Interstate Building, Kansas City, Mo., is consulting engineer.

W. S. Merkle, 414 North Twefl̶th Boulevard, St. Louis, consulting engineer, has plans for a hydroelectric generating plant in south central part of State, for a company whose name is temporarily withheld. Transmission system will be built for service at Argyle, Meta, Freeburg, and vicinity. Entire project will cost upward of $1,250,000.

Independent Plumbing & Heating Supply Co., 1119 Locust Street, has asked bids on general contract for a two-story storage and distributing plant with pipe cutting and threading shop and other departments, to cost $130,000 with equipment. D. R. Harrison, Ambassador Building, is architect.

Western Refrigeration Co., Twenty-first and Campbell Streets, Kansas City, Mo., will erect a one-story ice-manufacturing and refrigerating plant, to cost close to $50,000 with equipment. Ralph H. Oliver, 115 South Dearborn Street, Chicago, is architect.

Hemp & Co., 1945 South Vandeventer Avenue, St. Louis, manufacturers of heating equipment, have awarded general contract to Widmer Engineering Co., Laclede Gas Light Building, for a two-story and basement plant, and alterations and improvements in existing factory, to cost about $45,000.

American Stove Co., Kingshighway and Daggett Street, St. Louis, has let general contract to Grone Construction Co., Syndicate Trust Building, for a one-story and basement addition, 88 x 120 ft., to cost close to $40,000 with equipment.

Cleveland

CLEVELAND, Jan. 9.

MACHINE tool manufacturers and dealers have taken a fair amount of business in single machines since the start of the year and quite a little new inquiry has come out. There is more active demand for machines from the automotive industry from manufacturers of stampings, forgings and other parts. However, little business is coming from automobile manufacturers, as is indicated by reports that the market in the Michigan territory continues dull.

Mullins Mfg. Corporation, Salem, Ohio, which has taken a large order for automobile stampings, has purchased 15 presses, including two double-crank toggle presses, amounting to approximately $100,000. Timken Roller Bearing Co., Canton, Ohio, the past week purchased three engine lathes. Firestone Tire & Rubber Co., Akron, bought a 24-in. shaper and is figuring on quite a list of equipment for its new Pacific Coast plant. Goodrich Tire & Rubber Co., Akron, is also reported to be securing estimates for equipment for a Western plant. Increased activity of drop forge shops is reflected in some demand for die sinking machines.

Plans have been filed by E. F. Hauserman Co., 6810 Grant Avenue, Cleveland, manufacturer of metal partitions and kindred metal goods, for rebuilding its two-story plant recently damaged by fire, to be 165 x 200 ft., to cost $65,000 with equipment.

Akron-Neon Co., Akron, Ohio, recently organized, is planning operation of a local factory for production of special gas-electric signs, to cost about $20,000.

Wilking Carriage Works, Inc., 102 North Third Street, Marietta, Ohio, will erect a two-story addition, 63 x 68 ft., for production of automobile and motor truck bodies, to cost approximately $25,000.

Timken Roller Bearing Co., Canton, Ohio, has approved plans for a one-story addition, to cost $300,000 with machinery.

Beans Foundry Co., Martins Ferry, Ohio, is completing an addition for production of steel castings, designed to double the present capacity. Foundry, heretofore, has been devoted exclusively to iron castings.

Universal Portland Cement Co., 210 South La Salle Street, Chicago, is reported to have plans under way for a new mill in Cuyahoga River Valley section, vicinity of Cleveland, to cost upward of $1,750,000 with equipment.

Carbon Sales Division of National Carbon Co., Inc., Cleveland, has opened sales offices in connection with its brush service plants at 357 West Thirty-sixth Street, New York; 551 West Monroe Street, Chicago; 3 Barker Place, Pittsburgh, and 1824 Ninth Avenue, North, Birmingham.

Gustav Schaefer Wagon Co., 4180 Lorain Avenue, Cleveland, will rebuild portion of plant recently destroyed by fire, with loss reported more than $250,000 including equipment.

South Atlantic States

BALTIMORE, Jan. 9.

AN expansion and improvement program for power plants, transmission lines and other electric facilities is being planned by Consolidated Gas, Electric Light & Power Co., Lexington Building, Baltimore. Company is interested in new hydroelectric generating plant to be constructed on Susquehanna River by Pennsylvania Water & Power Co., Holtwood, Pa., on site south of last noted place, to cost close to $20,000,000 with transmission system. J. E. Aldred is chairman of board of Consolidated company.

American Oil Co., American Building, Baltimore, has plans for a two-story storage and distributing plant for lubricating oils in the Curtis Bay district, to cost approximately $40,000 with equipment.

Carolina Cement Co., care of J. A. Acker, chief engineer of New Egyptian Portland Cement Co., Port Huron, Mich., recently formed by Mr. Acker and associates, has arranged for purchase of property on Trent River, near New Bern, N. C., for a cement mill, to cost close to $2,500,000 with equipment. It is purposed to have one unit ready for service next fall.

Purchase division, Bureau of Standards, Washington, is asking bids until Jan. 20 for two 500-hp. watertube boilers to operate at 200 lb. pressure, with superheaters and soot blowers, for new power plant.

Board of Awards, office of city register, Baltimore, is taking bids until Jan. 18 for a one-story equipment storage and distributing plant, with repair shop. C. H. Osborne is chief of bureau of buildings.

Central Chemical Co., Hagerstown, Md., manufacturer of fertilizers, will erect a new unit at its branch plant at Money Point, near Norfolk, Va., to cost in excess of $100,000 with machinery.

Lavonia Cotton Mfg. Co., Lavonia, Ga., has completed plans for complete electrification of its mill, to cost close to $50,000 with equipment. J. E. Sirrine & Co., Greenville, S. C., are engineers.

Savannah River Lumber Co., Savannah Bank & Trust Building, Savannah, Ga., has plans for a new one-story unit at its mills at Port Wentworth, Ga., to be used largely for production of stock for automobile bodies, to cost $250,000 with machinery. Installation will include handsaws, surfacers, cut-offs, tenoners and other wood-working machinery. It is also proposed to install steam-electric power plant, with two watertube boilers, generators and accessory apparatus.

Lexington Water Power Co., Columbia, S. C., has begun work on a hydroelectric power development on Saluda River, about 10 miles from city, to develop initial capacity of 130,000 kw. and ultimate output of more than 200,000 kw. A transmission line will be built for service to Broad River Power Co., an affiliated organization. It is purposed to have first portion of plant ready for service in about 18 months. Entire project is estimated to cost $20,000,000. Company is operated by General Gas & Electric Corporation, 50 Pine Street, New York.

Standard Metal Weather Strip Co., 1511 Guilford Avenue, Baltimore, has acquired three buildings on 1½ acres near Broadway and line of Pennsylvania Railroad, with main two-story structure, 52 x 69 ft., and will remodel for a new plant. Present works will be removed to new location and considerable additional machinery installed.

E. H. Jacobs Mfg. Co., Danielson, Conn., manufacturer of textile loom equipment, plans enlargement in its branch plant at Charlotte, N. C., and will take over additional space for production facilities.

Bureau of Supplies and Accounts, Navy Department, Washington, is asking bids until Jan. 17 for 38,000 ft. steel wire, 6370 lb. copper wire, and 39,000 ft. telephone cable, for Brooklyn Navy Yard, schedule 8290; also for turbine cylinders for Mare Island, Puget Sound and Brooklyn Navy yards, schedule 8289.

Carolina Power & Light Co., Raleigh, N. C., plans extensions and improvements in power plant and system in vicinity of Asheville, N. C., to cost about $200,000 with equipment.

Electric City Ice Co., Anderson, S. C., recently formed by J. M. King, Seneca, S. C., and associates, plans construction of an electrically operated ice-manufacturing plant to cost about $45,000.

Chicago

CHICAGO, Jan. 9.

SALES resistance is less marked and machine tool sales are more numerous than in the closing days of 1927. Both inquiry and purchases, however, are scattered. Railroads in the Chicago area give no indication of submitting lists to the trade. In the St. Louis district orders are being placed against the requirements of the Missouri Pacific and the Texas & Pacific. Studebaker Corporation has closed for a few items for use in the production of a new eight-cylinder engine. A. O Smith Corporation, Milwaukee, will buy a few small machine tools and is indicating interest in several large machines. Marmon Motor Car Co., Indianapolis, Ind., is disposing of 800 used tools through a local dealer.

Naylor Spiral Pipe Co., 9145 Chauncey Street, Chicago, will build an addition, 71 x 200 ft., to cost $35,000.

Simplex Mfg. Co., 213 West Austin Boulevard, Chicago, manufacturers of roof flashing, will erect addition, 50 x 107 ft., to cost $14,000.

Plant of Belleville Enameling & Stamping Co., Belleville, Ill., was recently damaged by fire, loss being estimated at $200,000.

Capital Plumbing & Heating Supply Co., Chicago, has acquired property at Clybourn and Chester Avenues for a new two-story plant, to cost close to $100,000 with equipment.

K. & S. Mfg. Co., 1333 South Cicero Avenue, Chicago, operating a wood-turning plant, has engaged Joseph J. Novy, 2434 South Ridgeway Avenue, architect, to prepare plans for a two-story addition, to cost more than $100,000 with machinery.

Cooper Mfg. Co., Marshalltown, Iowa, manufacturer of automobile parts and equipment, will rebuild portion of plant recently destroyed by fire, with loss estimated upward of $75,000 including equipment.

Woolery Machine Co., Como and Twenty-ninth Avenues, Minneapolis, Minn., manufacturer of railroad hand cars, inspection cars and other railroad equipment, has plans for a one-story addition, 50 x 170 ft., to cost about $35,000, and will begin work in spring. It is planned also to build a one-story warehouse and distributing unit. Jensen & Foss, Essex Building, are architects.

Stickney & Co., Rockford, Ill., recently organized by Charles A. Stickney, 848 Haskel Avenue, and associates, are planning early operation of a local plant for manufacture of refrigerating equipment, water-softening apparatus, etc.

Central States Power & Light Co., Iowa Falls, Iowa, will begin work on an addition to its local steam-operated electric generating plant, to cost approximately $250,000 with equipment. Extensions will be made in transmission lines.

Northern Pacific Railroad Co., St. Paul, Minn., is reported planning a new sand and gravel-washing plant at Horton, Mont., to cost $75,000 with equipment. Pioneer Sand & Gravel Co., Horton, is interested in project and will be active in construction and operation of unit.

Continental Ice Co., Savanna, Ill., will proceed with a new ice-manufacturing plant, to cost more than $300,000 with equipment.

Fort Dodge Foundry, Fort Dodge, Iowa, which has been idle two years, has been reorganized and reopened as Fort Dodge Steel & Foundry Co., under management of T. C. Hicks, formerly superintendent Fort Dodge Steel & Culvert Co. It will specialize in iron, semi-steel and non-ferrous castngs, all types of grates, machinery castings and some alloy products. New equipment has been installed.

American Nut & Lock Co., 709-711 South Washington Street, Decatur, Ill., has been incorporated with $100,000 capital by Lester L. Barton, William E. Janssen and Henry

W. Orberg to manufacture a locknut invented by J. H. Fernferon of Sweden. Production will begin in two months.

Herman Nelson Corporation, Moline, Ill., manufacturer of Univent and Unit heater products, has let contract for a one-story addition, 120 x 126 ft., with two-story section, 56 x 120 ft., to cost about $43,000.

T. L. Knudtson Engineering Co., Chicago, has established headquarters at 1624 Milwaukee Avenue, and will maintain warehouse with stock of laundry machinery, boilers, engines, etc. It specializes in designing and equipping laundries and engages in power plant engineering.

Indiana

INDIANAPOLIS, Jan. 9.

CONTRACT has been let by Crescent Stove Works, Park Street and Belt Line Railroad, Evansville, Ind., to E. C. Dubber, 1104 East Columbia Street, for a new one-story and basement foundry, to cost about $24,000 with equipment.

Citizens Gas Co., Majestic Building, Indianapolis, is considering extensions and improvements in its artificial gas works, including installation of additional equipment, to cost $300,000. It is expected to begin work in spring.

E. A. Barger, 325 West Sixth Street, Gary, Ind., has plans for a two-story automobile service, repair and garage building, 125 x 125 ft., to cost approximately $100,000 with equipment.

Indiana Electric Corporation, 2 West Washington Street, Indianapolis, has arranged for a bond issue of $2,600,000, a portion of fund to be used for extensions and improvements, including transmission lines.

Air-More Products Co., Indianapolis, has been organized with capital of $100,000 to take over and consolidate Indiana Dry Cleaning Equipment Co., manufacturer of dry-cleaning machinery, exhaust fans, air compressors, etc., and Brandon Air Compressor Co., manufacturer of gasoline filling station equipment, paint spray machines, air compressors, etc., and will occupy plant of the first noted company at 3402 Northwestern Avenue, where production will be concentrated. New company will continue same line of production and will carry out an expansion program. Fred A. Sublette is president of new organization; John E. Brandon, vice-president; and Cleo McLean, engineer and production manager.

Gary-Chesterton Chemical Co., Chesterton, Ind., is said to have plans for rebuilding its plant destroyed by fire several weeks ago, with loss in excess of $90,000 including equipment.

Board of Education, Mount Vernon, Ind., is said to be planning installation of manual training equipment in a two-story high school to cost $200,000, for which bids will soon be asked on general contract. N. S. Spencer & Son, 180 North Michigan Boulevard, Chicago, are architects.

Chrysler Motor Corporation, Detroit, will proceed with a one-story addition, 100 x 300 ft., at its branch plant at Newcastle, Ind., to be equipped as a new die shop. Present department will be remodeled for general production. Extensions will also be made in power station at plant. Entire program will cost more than $85,000. Frank D. Brebner is plant manager.

Muncie Cap & Set Screw Co., Muncie, Ind., has changed its name to Acme Machine Products Co.

Chromolite Corporation, 403 West Michigan Street, Indianapolis, has been organized to do chromium plating. Factory has been acquired and production will begin within six weeks.

Gulf States

BIRMINGHAM, Jan. 9.

PLANS are being completed by Fort Worth Gas Co., Fort Worth, Tex., for a one-story equipment storage and distributing plant, with machine shop, to cost upward of $100,000 with equipment.

Muldoon Fullers' Earth Co., First National Bank Building, Houston, Tex., is planning installation of equipment for development of Fullers' earth properties at Muldoon, Tex., where more than 500 acres has been secured. The initial plant will include loading and mining machinery, grinding mill, drying plant, conveying and sacking equipment, etc.

Texas Central Power Co., Frost National Bank Building, San Antonio, Tex., is said to be planning construction of a new power house in vicinity of Brownsville, Tex., to cost about $45,000 with equipment.

Fire, Dec. 31, destroyed the peanut oil manufacturing plant, peanut butter mill, peanut-shelling mill and other portions of plant of Woldert Pecan Co., Tyler, Tex., with loss reported at $150,000 with equipment.

Birmingham Boiler & Engine Co., 3001 North Seventh Avenue, Birmingham, has taken out permit for a one-story addition, 90 x 140 ft., to be equipped as a steel fabricating works.

Central Florida Light & Power Co., Dunnellon, Fla., is reported planning construction of a new ice manufacturing plant at Inverness, Fla., to cost more than $40,000 with equipment.

Ovens, power equipment, conveying machinery will be installed in a one and two-story plant, 100 x 200 ft., to be constructed by McGough Bakeries Corporation, 731 North Twenty-sixth Street, Birmingham, to cost $200,000.

Casner-Chevrolet Co., 400 East Yandell Boulevard, El Paso, Tex., local representative for Chevrolet automobile, has plans for a two-story service, repair and sales building, 115 x 120 ft., to cost close to $100,000 with equipment. Trost & Trost, Two-Republic Building, are architects.

San Antonio Public Service Co., San Antonio, Tex., is completing plans for expansion at its Comal steam-operated electric power plant, near New Braunfels, Tex., including installation of a 30,000-kw. turbo-generator and accessory equipment, to cost upward of $500,000, including transmission line construction. It is understood that contracts for equipment will be placed soon.

Roxana Petroleum Corporation, Shell Building, St. Louis, has taken an option on 600 acres at Houston, Tex., and is reported considering a new oil refinery at that location.

Gulf States Utilities Co., Beaumont, Tex., is arranging an expansion and improvement program to cost close to $1,200,000, including power stations, transmission lines, gas plants and ice-manufacturing plants. It is purposed to make extensions in the ice-manufacturing plant at Orange, Tex., as well as enlarge electric power plant at that place.

Rockwood Stone Co., Rockwood, Ala., will soon begin erection of a new limestone finishing mill, one story, 160 x 400 ft., to cost close to $125,000 with machinery. Leo F. Caproni, 1056 Chapel Street, New Haven, Conn., is consulting engineer.

National Specialties Corporation, 908 Republic Bank Building, Dallas, Tex., recently organized, plans operation of a local factory for manufacture of electric flashing signs.

Bastrop Ice & Storage Co., Cypress Street, Bastrop, La., has approved plans for a one-story addition to its ice manufacturing plant, 90 x 115 ft., to cost $45,000 with equipment.

Graver Corporation, East Chicago, Ind., has established Texas headquarters at 201 Petroleum Building, Fort Worth, and has discontinued office at Houston.

Milwaukee

MILWAUKEE, Jan. 9.

WHILE expectations of improvement in demand for machine tools have not been realized much past the stage of more active inquiry as yet, indications point toward early betterment of sales. The automotive industries are particularly prominent in inquiries now being put out to cover requirements within the next three to four months. Sales so far this year have been of satisfactory volume, and consist largely of single items to a wide variety of shops. Sentiment is more hopeful than perhaps for five or six months past.

Worden-Allen Co., Milwaukee, manufacturer of structural steel and general contractor and consulting engineer, has an expansion program which contemplates doubling size and output of its works at Capitol Drive and Port Washington Road. Details are not yet available, but a new issue of $600,000 of preferred stock has been authorized to supplement the present capitalization of $600,000 common stock. Eugene W. Krueger is president, and E. F. Zuleger, general manager.

Simmons Co., Kenosha, Wis., manufacturer of steel beds, furniture, etc., has started work on an addition costing $250,000. Branch works at Richmond, Va., are being consolidated with main works, and purchasing department, which was moved to Chicago several years ago, is being returned to headquarters in Kenosha plant.

Founders Sand & Supply Co., Detroit, Mich., has purchased 52 acres of limestone deposits at Sturgeon Bay, Wis., and will establish plant for quarrying and shipping directly by Great Lakes vessels. Investment of approximately $250,000 is contemplated.

Fraser Co., 667 East Water Street, Milwaukee, designer and builder of cereal mills, elevators, etc., has general contract for an $80,000 addition to plant of Commercial Milling Co., 203 Randolph Street, Detroit, Mich. Bids for a five-story extension are being taken until Jan. 20.

Northern Conveyor Co., Janesville, Wis., has postponed indefinitely construction of an addition to cost $40,000; plans by W. H. Blair, local architect.

Quality Aluminum Co., 405 Lincoln Avenue, Waukesha, Wis., is taking bids for a foundry addition; cost is not revealed.

Common Council, Neenah, Wis., has appropriated $30,000 to municipal waterworks commission for purchase of a new power unit, generator, pump and motor to replace obsolete steam pumping and boiler equipment. Specifications will be issued about Jan. 23; H. S. Zemlock, city clerk.

Board of Education, Watertown, Wis., is asking bids until Feb. 8 for a two-story addition, 50 x 167 ft., to Junior High School. Plans are by Edward Tough, architect, Madison, Wis. Dr. F. F. Schlueter is president of board.

Common Council, Wauwatosa, Wis., suburb of Milwaukee, has approved bond issue of $120,000 for construction of an additional water supply unit. Plans are being prepared by J. E. Lowther, city engineer, and call for a deep well, pumping plant and elevated steel tank and tower. Bids probably will be asked early in March; A. V. Brigham, city clerk.

Tools of Jolite, Inc., Milwaukee, has been organized by L. C. Mayhew, 327 Prospect Avenue, and associates, to manufacture machinery, tools, dies, implements, etc., employing a special metal. Plans are being made for establishment of a shop and purchase of equipment.

War Department, Washington, has ordered construction of a waterworks system at Camp Williams, formerly Camp Douglas, Wis., at a cost of $70,000. Plans for well, pumping plant, steel storage tank, etc., are being drawn by Maj. H. C. Hengel, State military architect, 445 Milwaukee Street, Milwaukee. Adj. Gen. Ralph M. Immell, State Capitol, Madison, Wis., is in charge.

Wisconsin Iron & Wire Works, 1660 Booth Street, Milwaukee, has changed its name to Wisconsin Ornamental Iron & Bronze Co.

Pittsburgh

PITTSBURGH, Jan. 9.

FIRE, Dec. 31, destroyed the building occupied jointly by H. P. Gazzam Machine Co., and Stewart-Thomas Foundry Co., 3200 Penn Avenue, Pittsburgh, spreading to adjoining plant of General Bronze Co., with total loss in excess of $75,000 with equipment.

Fokker Aircraft Corporation, Glendale, W. Va., headed by Anthony H. G. Fokker and Major Lorillard Spencer of Atlantic Aircraft Corporation, Hasbrouck Heights, has awarded general contract to R. R. Kitchen & Co., Wheeling, W. Va., for initial units of its plant at Glendale, totaling about 100,000 sq. ft. of floor space, to cost close to $300,000 with equipment. C. W. Bates, 77 Twelfth Street, Wheeling, is architect.

Carbide & Carbon Chemical Corporation, South Charleston, W. Va., manufacturer of industrial gases, oxygen, etc., is said to be planning to rebuild portion of plant destroyed by fire Jan. 1, with loss upward of $350,000 including equipment. Headquarters are at 30 East Forty-second Street, New York.

Mayer Body Corporation, 6461 Frankstown Avenue, Pittsburgh, is having plans drawn for a one-story addition to its automobile body works, to cost more than $25,000.

Rochester & Pittsburgh Coal & Iron Co., Indiana, Pa., has been formed with capital of $17,243,000 to take over and consolidate local company of same name and Jefferson & Clearfield Coal & Iron Co., Brookville, Pa., with properties in Jefferson and Clearfield Counties. Company will operate 12 mines and plans expansion. L. W. Robinson is chairman of board, and B. M. Clark, Indiana, president.

Pittsburgh & Lake Erie Railroad Co., Pittsburgh, has plans for a one-story car repair shop at Woodlawn, Pa., to cost approximately $45,000 with equipment; A. R. Raymer, Smithfield and Carson Streets, Pittsburgh, chief engineer.

Pacific Coast

SAN FRANCISCO, Jan. 4.

PLANS have been filed by Southern California Edison Co., Los Angeles, for a one-story power and switching substation near Irvine, Cal., to cost $110,000 with equipment.

Kimball Pump Co., 1010 East Sixty-second Street, Los Angeles, has awarded general contract to Austin Co. of California, Inc., for a one-story addition.

Doheny-Stone Drill Corporation, Los Angeles, manufacturer of oil drilling equipment, tools, etc., has awarded contract to Llewellyn Iron Works for initial unit of plant at Torrance, to be one story, 180 x 360 ft., to cost about $225,000 with equipment. An outdoor crane runway will be installed, with adjoining smaller unit, 60 x 90 ft. A complete heat-treating division will be provided. Hamm, Grant & Bruner, Ferguson Building, Los Angeles, are architects.

Pacific Fruit Express Co., 65 Market Street, San Francisco, subsidiary of Southern Pacific Co., has plans for a one-story ice-manufacturing and pre-cooling plant, 165 x 440 ft., at Fresno, Cal., with car-icing platform 3300 ft. long, to cost close to $1,000,000 with equipment; engineering department of company in charge.

Crane Creek Lumber Co., Lakeview, Ore., Frank Boutin, manager, is planning construction of a new lumber and saw mill in vicinity of Alturas, Modoc County, Cal., with logging and transportation facilities, to cost $400,000 with machinery.

Provo Ice & Cold Storage Co., Provo, Utah, is considering an addition to its cold storage and refrigerating plant, to cost $50,000 with equipment.

Spokane Lead & Zinc Co., Spokane, Wash., is completing plans for a hydroelectric power development on Clarks Fork, branch of Columbia River, near Metaline Falls, Wash., to provide capacity of 50,000 hp. for mining operations in that section. A transmission line will be built. Entire project is reported to cost more than $3,500,000.

Karpen & Brothers, 636 West Twenty-second Street, Chicago, and Los Angeles, manufacturers of furniture, have plans for a four-story factory at Huntington Park, near Los Angeles, to cost approximately $275,000 with equipment. Hamm, Grant & Bruner, Ferguson Building, Los Angeles, are architects.

F. A. Fullerton, business manager, Milton, Ore., is asking bids until Jan. 23 for one 1000-kw. electric generator, direct-connected to hydraulic turbine and exciter, for a municipal hydroelectric power project, together with governor, gate valves, and accessory equipment. Bids for other equipment will be called later. John H. Lewis, Railway Exchange Building, Portland, is engineer.

Tom G. Taylor Co., Portland, Ore., plans construction of a 120-ton pulp and paper mill in Georgetown district, Seattle, at estimated cost of $3,000,000.

J. A. Roake, Oregon City Foundry, Oregon City, Ore., has purchased property near Canemah Park and will erect a foundry and machine shop, each 48 x 65 ft. Fire partially destroyed the former plant.

Craig Shipbuilding Co., Long Beach, Cal., is having plans prepared for a new foundry, 88 x 97 ft., to replace a building recently destroyed by fire.

Cutler-Hammer Mfg. Co., Milwaukee, manufacturer of electric motor control apparatus and kindred equipment, has opened sales offices at 970 Folsom Street, San Francisco; 229 Boyd Street, Los Angeles, and 2203 First Avenue South, Seattle. Complete stocks of company's standard items will be carried in all offices.

Multnomah Iron Works, Thirtieth and Nicolai Streets, Portland, Ore., has been organized to manufacture drag saws, concrete mixers and electric washing machines. It does not operate a foundry in connection with plant.

Canada

TORONTO, Jan. 9.

SALES of machine tools the past week were comparatively light, but new interest and inquiries were more general and leading builders and dealers look for a continuation of the good demand that prevailed the past year. Considerable buying is yet to be done by the automotive industry of this country for additions under way. Tool buying for mining operations was a strong feature of the 1927 market, and, according to indications, this will continue for some time. The Canadian National Railways have not completed their purchases for the Point St. Charles shops at Montreal, and lists from this quarter are expected at an early date.

Canadian Salt Co., Sandwich, Ont., will build an addition to cost approximately $300,000; architect not yet appointed.

Public Utilities Commission, Palmerston, Ont., is planning installation of several electrically driven water pumps.

A. E. Wheeler, New York, consulting engineer, is preparing plans for erection of a concentrator, with capacity of 500 tons, at Rouyn, Que., for Noranda Mines. Contracts have been awarded to Canadian Bridge Co., Walkerville, for fabricating and erection of steel frame-work, and contract for a part of machinery has also been let.

Chrysler Corporation of Canada, Ltd., Windsor, Ont., has awarded contracts in connection with additions to its plant to cost $200,000. A two-story reinforced concrete building, 101 x 400 ft., is so designed that two additional stories can be added later. Border Construction Co., Walkerville, Ont., is general contractor. Pennington & Boyde, architects and engineers.

Anglo Newfoundland Development Co., Ltd., Grand Falls, Newfoundland, has started work on a new power development plant with capacity of approximately 100,000 hp.

Department of Public Works, Ottawa, Ont., S. E. O'Brien, secretary, will start work soon on an addition to Esquimalt Dry Dock, Esquimalt, B. C.

Foreign

CAPACITY of works in Chile of Anglo-Chilean Consolidated Nitrate Corporation, 120 Broadway, New York, will be increased from 300,000 to 500,000 tons per annum, at a cost of more than $1,000,000. E. A. Cappelen Smith, an official of company, has left for plant site to supervise expansion.

Cork Industrial Development Association, Cork, Ireland, in conjunction with Cork County Committee of Agriculture, plans construction of two new beet sugar mills in different parts of county, one plant to be under direction of each organization. Projects will cost close to $1,750,000 with machinery. Information at office of Bureau of Foreign and Domestic Commerce, Washington, reference England No. 60182; also, at American Consulate, London, England, William L. Cooper, commercial attaché.

Tokio Electric Light Co., Tokio, Japan, has been formed with capital of 407,140,000 yen (about $203,570,000) to take over company of same name and Tokio Electric Power Companies. New organization will carry out an expansion and improvement program, including power plants and transmission systems.

Ministry of Labor, Prague, Czechoslovakia, is considering additional terminal facilities at harbor of Bratislava, project to be carried out in conjunction with Bratislava Chamber of Commerce. It is purposed to form a joint stock company with capital of 4,000,000 crowns (about $120,000), to handle enterprise, which will include a two-story and basement warehouse terminal, about 89 x 310 ft., with traveling crane, elevating, conveying and other equipment. American Consulate, Prague, Karl L. Rankin, assistant trade commissioner, has information regarding project.

A company at Rotterdam, Netherlands, has obtained a concession to construct and operate an electric generating plant at Menado, Celebes, Netherland East Indies. Information at office of Bureau of Foreign and Domestic Commerce, Washington, reference Netherland East Indies No. 35-X; also at American Consulate, Batavia, Donald Renshaw, trade commissioner.

Aalborg Portland Cement Works, Jutland, Denmark, is arranging for increase in capital to 4,800,000 kroner (about $1,250,000), a portion of fund to be used for expansion and improvements.

The Dominican Government plans construction of a breakwater approximately 3000 ft. long and other harbor improvements for port of Santo Domingo, also construction of harbor improvements to ports of Puerto Plata and San Pedro de Marcoris, for which an appropriation of $2,000,000 has been made. J. G. White Engineering Corporation, New York, is in charge.

The Osaka Ventilating Co., Itachibori, Japan, is planning to build a new shop for the manufacture of fans, blowers and other ventilating equipment and is desirous of receiving literature and prices on machines for riveting, welding and sheet metal working. H. Ohta is manager.

Tuthill & Co., Inc., 225 Broadway, New York, has been appointed general agent in North America for Mansfeldscher Metallhandel, Berlin, and Mansfeld Mining Co., Eisleben, Germany. Mansfeld companies produce and refine copper, lead and silver and mine coal and potash. Company also manufactures semi-finished and finished copper, brass and silver materials and operates non-ferrous rolling mills in Germany.

NEW TRADE PUBLICATIONS

Spur Gears.—Boston Gear Works, Norfolk Downs, Mass. Leaflet 7-27, covering hardened and ground tooth spur gears for heavy duty. The pinions are generated ground by a special process and warping due to hardening is said to be eliminated by the hardening process.

Motor Drive Equipment.—Allis-Chalmers Mfg. Co., Milwaukee. Bulletin 1140, devoted to reversing motor planer drive constant voltage equipment. Advantages of direct-connected motor drive are given as increased output, decreased power consumption, wide range of speeds, ease of control and lower maintenance.

Reinforcing Lath.—Milwaukee Corrugating Co., Milwaukee. Catalog 20-D, being a technical data book for architects, engineers and contractors, which features the company's ¾-in. stay-rib No. 3 reinforcing lath.

Mechanical Sledges.—Chambersburg Engineering Co., Chambersburg, Pa. Leaflet describing the Chambersburg mechanical sledge for all sorts of hand forging in foundries, forge shops, machine shops, repair shops, mines, etc.

Fabricated Steel.—R. C. Mahon Co., Detroit. Catalog of 24 pages illustrating industrial and commercial buildings erected by the company and factory equipment, including low-temperature drying ovens, spray booths, shaving exhaust systems and special factory handling equipment. The Mahon steel roof deck, complete roofing and roof maintenance service and fire doors are described and illustrated.

Electrical Products. — Crouse-Hinds Co., Syracuse, N. Y. Bulletin 2102 dealing with the company's various types of flexible fixture hangers; folder 52, describing the new Obround condulet in which the cover opening is unobstructed, and advance sheets 94, 95 and 96, devoted to safety hand lamps and fixture hanging condulets.

Materials Handling Equipment.—American MonoRail Co., Cleveland. Catalog A, 64 pages, covering overhead conveying equipment, including monorail systems, switches, trolleys, curves, turn-tables, transfer cranes, chain hoists, monorail lifts, electric hoists and various parts and accessories.

Electrical Spraying.—Electric Sprayit Co., 217 Iron Street, Detroit. Folders describing the operation of a hand spraying device operated by a small electric motor, which drives a fan at high speed and atomizes the liquid or powder being sprayed.

Motor Starting Switches.—Allen-Bradley Co., Milwaukee. Leaflet, dealing briefly with the type J-1552 across-the-line motor starting switch. There are several photographs and descriptions of varied installations.

Air-Operated Chucks. — Logansport Machine Co., Logansport, Ind. First of a series of three circulars showing the application of the company's air-operated chucks. The chucks are pictured in operation on various types of machine tools.

Adamite Dies.—Mackintosh-Hemphill Co., Pittsburgh. Brief bulletin devoted to the application of adamite dies for pressed metal work. Special emphasis is given to the use of these dies for cold forming in a considerable variety of metal works.

Pressed Metal Products.—Youngstown Pressed Steel Co., Warren, Ohio. Bulletin describing factory equipment manufactured by the company. Of particular interest are corrugated pressed steel platforms, solid and sectional boxes for transport work and tote pans.

Water Hammer Drills.—Sullivan Machinery Co., 122 South Michigan Avenue, Chicago. Bulletin 81-M, describing the Sullivan T-3 water hammer drill, a late development in a drifting or tripod drill for mining, quarrying and contracting service. The machine will drill 14-ft. holes for 1¼-in. powder readily and will go deeper under favorable conditions.

THE IRON AGE

New York, January 19, 1928

ESTABLISHED 1855 VOL. 121, No. 3

Moderate-Sized Plant Modernizes

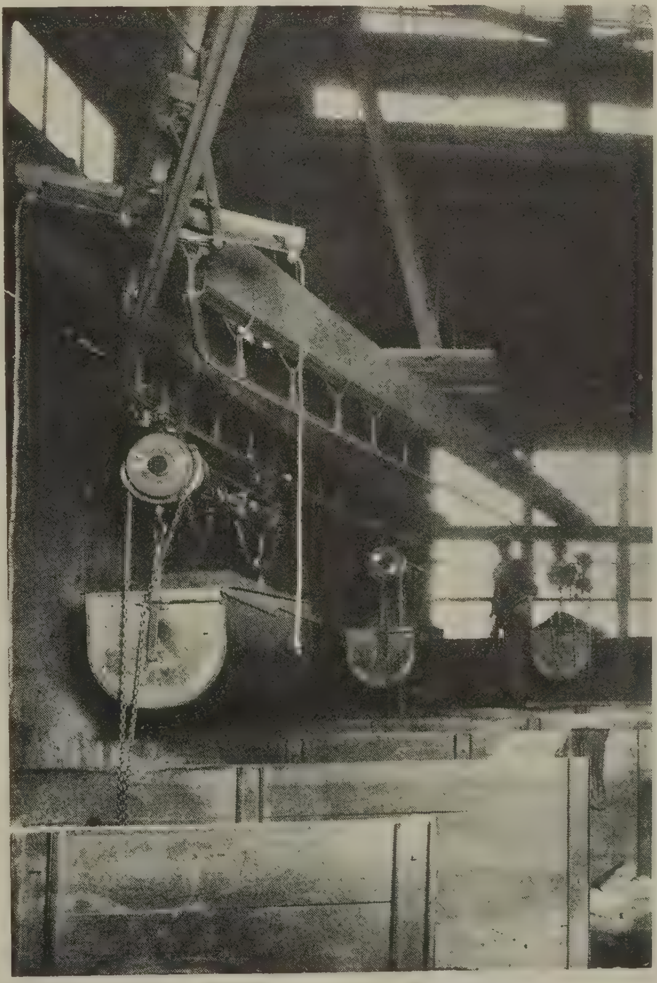
By Installing Simple Conveyors and Trolleys, Regrouping Machinery and Instituting Four-Shift Working Day

IN a period when manufacturing operations within an industry are undergoing radical changes, it becomes necessary for the small and medium-sized plants as well as for the large companies to adopt the innovations which have proved successful. At least they can adapt to their own peculiar needs the general principles underlying the new system. Upon their ability to bring about these changes economically frequently depends their continued prosperity.

Modernizing Without Rebuilding

Such a situation confronted the officials of the American Foundry Co., Indianapolis, a few years ago. In their foundry, old standard practices were being followed consistently in the manufacture of automobile cylinder blocks. Then came the introduction of many new customs into the foundry industry, such as the continuous pouring process, and various labor-saving devices in the molding room. The problem of lowering production costs would have been easier if a new foundry could have been built. But the question of revolutionizing an old one so that operations conform strictly to the newest, approved practice is more difficult. Nevertheless the American Foundry Co. has answered it satisfactorily without the necessity of financing the erection of a new foundry.

The buildings were substantially constructed of brick. The overhead structure, however, was not sufficiently strong to support heavy cranes or other equipment which would impose an undue burden. It was decided, therefore, to install an overhead monorail system which would reach into practically every department of the plant. The rails of this track (manufactured by the Louden Machinery Co., Fairfield, Iowa) are hung from the wooden roof trusses as shown in the various views. At the same time new equipment was introduced and continuous molding established.



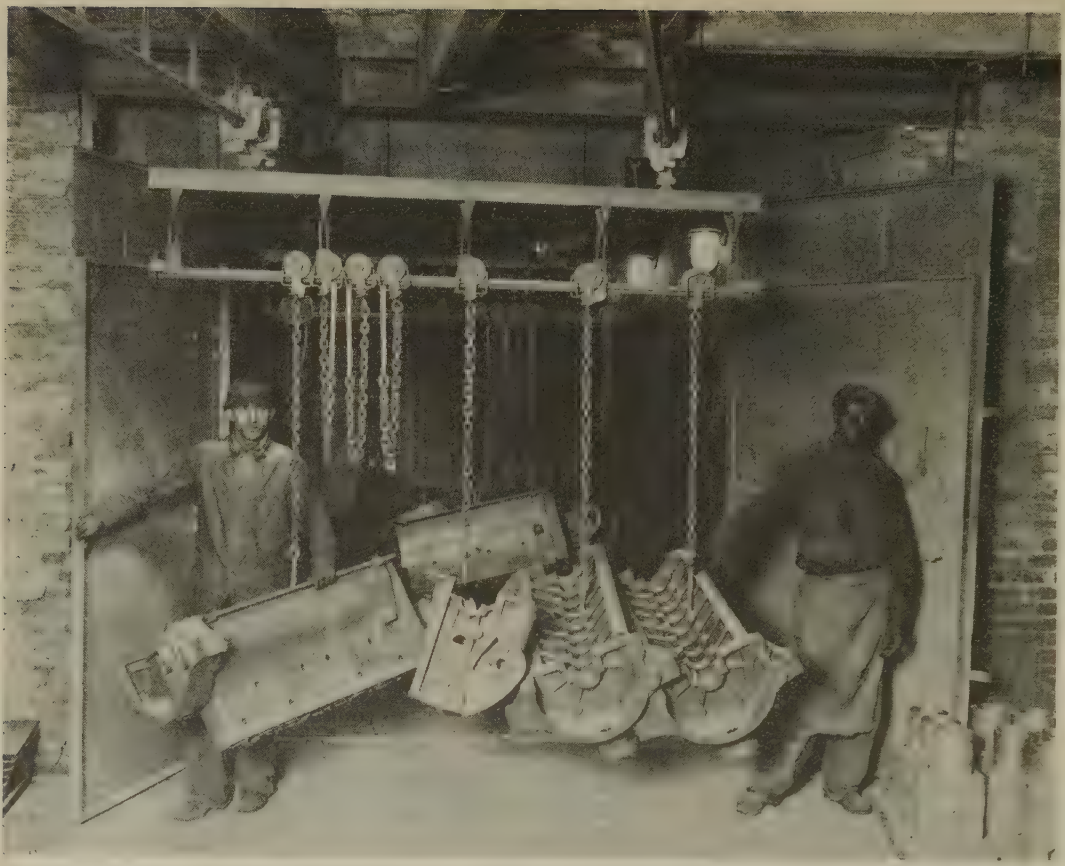
SAND Is Taken From Shakeout or From Storage to Mixing Plant in Buckets. Note switching device

It might seem that much time would be required to effect these changes. But the work was so coordinated that the foundry closed on Friday afternoon after operating on the old basis and opened Monday morning ready to produce castings by new methods.

Four-Shift Day an Important Innovation

The main foundry floor is divided into two portions of equal size, the division line running the length of the structure. Along this central line are located the molding machines. The workmen are grouped into three sections, consisting of the molding gang, the pouring gang and the shakeout gang. They operate on four shifts a day arranged as follows: 7 a. m. to 9 a. m.; 9 a. m. to 11 a. m.; 11:30 a. m. to 1:30 p. m.; 1:30 p. m. to 3:30 p. m. During the first period the molding gang works on one floor, with the pouring gang following about two rows behind. At the same time the shakeout gang is busy on the other floor, getting it ready for the pouring and molding gangs to use it at nine o'clock. When the second period arrives, the locations of the gangs are reversed, the molding and pouring gangs occupying floor No. 2 and the shakeout gang, floor No. 1.

Because of the continuous pouring system and of the shifting of the men from one section of the



CARRIAGES Move Broadside Through Sand Blast. Double turntable brings trolleys into line for monorail

floor to another, production has been doubled without increasing the amount of molding floor space, the number of necessary flasks has been reduced 50 per cent without decreasing the output of castings, and night work has been entirely abandoned.

Monorail Handles Material in Production

In the practical working out of production problems at the American Foundry Co., the monorail system has been so interwoven into the various operations that it cannot well be separated from them and is deserving of detailed study. On trolleys suspended from the rails are numerous kinds of carriers which differ according to the particular service being performed. These carriers are moved about by man-power. Traffic is sufficiently heavy so that two main lines of track are necessary in the greater part of the plant. Many switches cross from one line to the other so that material can be delivered to almost any portion of the plant. Switches are controlled by rope pulls, as shown in one of the views.

The heat is tapped into a ladle hanging from the monorail in front of the cupola. A workman then hooks the ladle and pulls it to the pouring floor, where it is lifted by an air hoist on an overhead crane to the pouring position. When empty, the ladle is taken by the crane back to the monorail conveyor, on which it is transported to the cupola.

Castings taken from the molds by the shakeout gang are placed on a platform, and then carried by monorail conveyor to the knockout room.

A slight variation is noted in the arrangement for moving cylinder blocks through the sand blast room. Instead of a single rail there are two paralleling each other. From them is suspended a crosswise carrier from which dangle a number of chains. Attached to

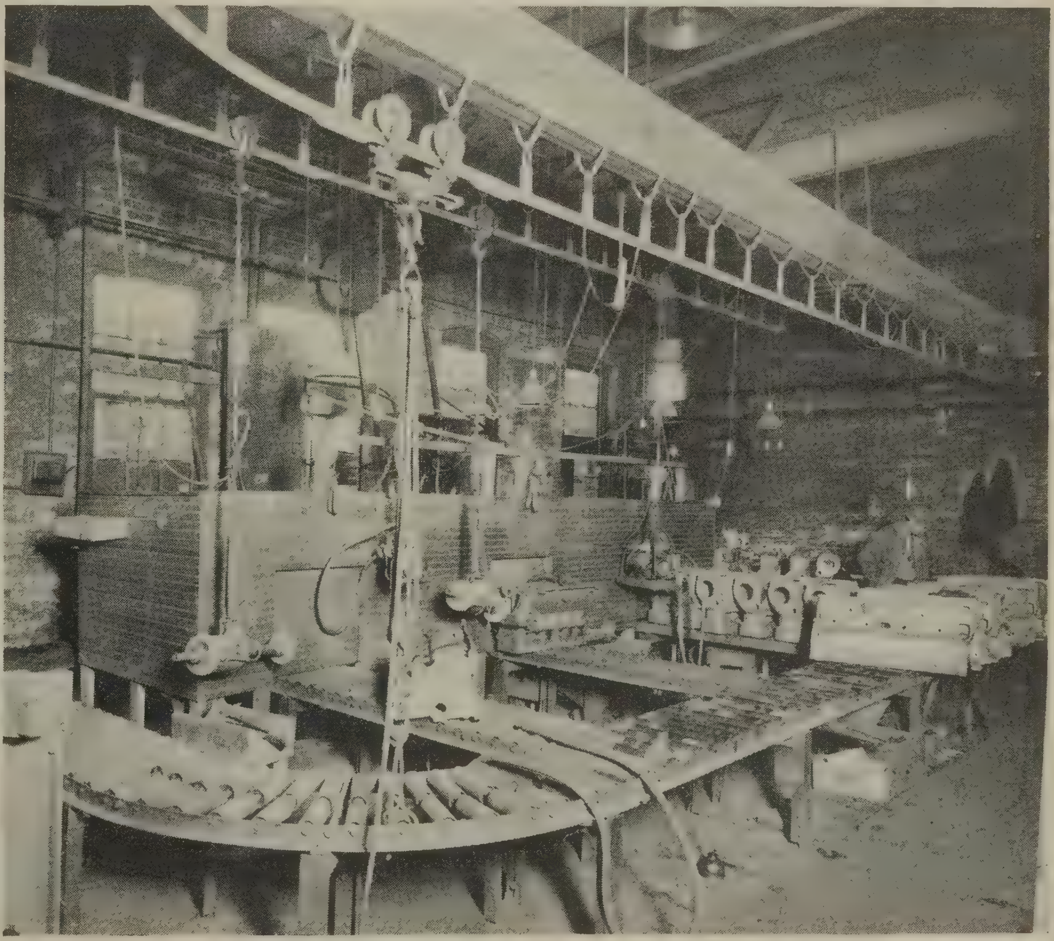
CUPOLA Slag Caught in Pots, Transported Outside, Cooled and Dumped

each chain is a cylinder block. Each block can be turned completely around during the sand blasting and then shuttled to one end of the carrier so as to make room for the next block. When all of the blocks are sand blasted, the carrier is taken on the parallel monorails to two turntables, operating in unison, which transfer the trolleys so that the carrier can be run off at right angles on a single rail to the grinding department.

In the finishing room use is made of both overhead transport and gravity conveyors. Running the full length are three Logan conveyors of the latter type, each handling a different kind of casting. On the journey down the gravity conveyor the castings are taken off by hand at several points for grinding and other machining work, and at the end the monorail again picks up the cylinder block and carries it into the shipping room. A number of blocks may be handled at once on a chain hoist suspended from the monorail. The hoist is equipped with a long bar having numerous hooks, and from each hook is suspended a cylinder block. Blocks are taken by hand truck from the door into the railroad car for shipment.

Core and facing sand is handled from bins by monorail conveyor in bottom dump buckets with a capacity of 1900 lb. Some buckets are divided into compartments, each of which contains a special kind of sand. In this way special mixes can be proportioned and dumped into the muller.

In the preparation of facing sand the monorail



EXAMPLE of the Effective Use of Overhead and Roller Conveyors in Finishing and Reclamation Departments conveyor is also indispensable. Drag molds are knocked out at a spot adjoining the conveyor, and sand is shoveled into a bucket and moved on the monorail to a steel hopper feeding the mixing equipment. Tempered sand is deposited in boxes holding 14 cu. ft. suspended from the monorail, whereby they are moved to the molding floor. An air hoist sets them down next to the molding machines. During the process just described the sand is shoveled but once. Only two men are needed for the entire operation. One delivers the sand to the facing room and brings it back to the molding floor; the other operates the mixing machinery.

Unique Slag Disposal

The usual practice in smaller foundries is to let the slag drop into a hole in the floor. This hole is kept full of water, and the slag becomes a stringy, spongy mess which is shoveled into wheelbarrows and dumped. At the American Foundry Co. a cast iron dump bucket is spotted under the weep hole of the cupola and the slag runs into it. When the bucket is full it is pulled out on the monorail conveyor to the dump yard, where the slag, still in the bucket, is allowed to cool. The bucket is then tripped and the slag drops out in one large lump. At intervals the lumps are loaded onto wagons and hauled away.

These are the methods by which the company has solved the problem of producing castings economically. In fact, the accomplishments can be definitely measured. The amount of floor space has been reduced considerably without decreasing the volume of output. Man-power has been cut to a minimum through the operation of an adequate conveying system. If it is necessary to curtail activities at any time, this foundry has no expensive transportation equipment and there are no skilled operators lying idle but contributing substantially to overhead expenses. The general arrangement at this foundry, therefore, is designed to meet, in an admirable way, the needs of the company, and is sufficiently elastic to respond readily in a period of either expansion or contraction.

South's Importance in Iron and Steel Detailed in Survey

Department of Commerce Publishes Book Which Is the First of Nine Regional Investigations of Industrial Growth

WASHINGTON, Jan. 14.—An interesting fact about the iron and steel industry of the Southeast is that it is growing up in an area which not so many years ago did not consider itself industrially important, nor was it so looked upon by other sections, says a review of the industry made in a publication, "Commercial Survey of the Southeast," issued by the Department of Commerce. The survey, well illustrated, comprises 477 pages, and is the first of a new series of nine regional analyses covering the whole country.

The purpose of the survey is to present a picture of the fundamental economic conditions within the southeastern trade area, with particular reference to the marketing of products. Particular emphasis is laid upon commodity movements, sales problems, indexes of income, and consumption.

The chief outlook of the iron and steel industry in the Southeast is declared to rest upon capitalizing and encouraging opportunities for the manufacture of numerous items required for consumption and production as the whole South develops. The growth and expansion of the textile and knit-goods and allied industries throughout the Southeast are declared to furnish one of the most important industrial markets in that area for hardware, building materials and goods required for plant operation and maintenance. On the other hand, it is said, this development has offered a market for specialized machinery and supplies, of which over 90 per cent is still purchased from New England. It is stated that evidence of the character of allied development which is taking place in connection with the iron and steel industry may be found in the already established plants manufacturing sugar-mill, vegetable-oil mill, and cotton-compress machinery, cotton gin, agricultural equipment, ice-making, textile, lumbering, mining and miscellaneous machinery, stoves, heaters and furnaces, chemicals, and railroad-car equipment at various points in the Southeast, but chiefly centered around Birmingham. The iron and steel area, it is pointed out, promises to be a concentrated manufacturing section, with an increasing consuming population, having a purchasing power determined by current income.

Iron and Steel Second Only to Lumbering

The review explains the advantages looking to the building up of the iron and steel industry by reason of the close proximity of raw materials and lower freight rates, together with labor and markets. Grouping all phases of iron and steel production in Alabama makes the industry, as a whole, second only to lumbering in the average number of industrial wage earners in 1925. Those engaged in the production of iron and steel and their products average more than 27,500, large numbers of whom are negroes, both skilled and unskilled workers. In the value of product the iron and steel industry has no rival, yielding an output of about $194,000,000 in 1925. The industry in Tennessee employed somewhat more than 5800 with an output of $26,500,000.

These facts, it is stated, all indicate that this industry is more closely confined to the location of raw materials than any other among the industries of the Southeast, and so far the important development is limited to the Birmingham area, Anniston, Gadsden and Chattanooga. These centers are declared to be representative of the present status of this industry in the South. Alabama, it is said, is the third State in the United States in the number of blast furnaces, most of which are in the Birmingham district, and Tennessee is eighth.

This industry, it is pointed out, does not end with pig iron production, since nearly 80 per cent of the total output is carried into further states of manufacture in the same plants, which usually operate steel works, rolling mills and foundries. The leading products in order of tonnage, it is stated, are rails, wire rods, plates and sheets, merchant bars, structural shapes, hoops, bands, cotton ties and bars for reinforcing concrete.

Copies of "Commercial Survey of the Southeast" may be obtained for $1 each from the Superintendent of Documents, Government Printing Office, Washington.

Construction Decreased 1 Per Cent in 1927

Contracts awarded for new building and engineering work in 1927 in the 37 States east of the Rocky Mountains totaled $6,303,055,100, according to the F. W. Dodge Corporation, New York. This was a drop of 1 per cent from the record total of 1926, and an increase of 5 per cent over 1925. For the entire country, 1927 construction volume was estimated at $6,800,000,000, a loss of 3 per cent from 1926.

New construction begun in December in 37 States amounted to $477,363,800, a 3 per cent increase over November, but a decrease of 11 per cent from December, 1926. Of last month's total 43 per cent was for residential buildings, 19 per cent for public works and utilities, 18 per cent for commercial buildings, 6 per cent for industrial projects and 5 per cent for educational buildings.

Improvements in Ferrous Sintering

Continuous Dwight & Lloyd Process Shows 500 Per Cent Production Increase—Profits to Be Had

BY EDWARD J. TOURNIER*

INCREASE in daily production of sinter from 180 tons to 1200 tons on a single sintering machine is due primarily to two factors, both having to do with the mechanics of the process rather than with its chemistry. The chemical constituents and physical structure of sinter have been already discussed in the pages of THE IRON AGE and, so far as recent investigation of these properties shows, the 500 per cent increase in production cannot be thus accounted for. The largest of the early sintering machines had a grate area of 90 sq. ft., while the latest large-size machine has a grate area of 380 sq. ft., an increase of over 300 per cent.

The first factor is the improvement in materials control and the second is the improvement of sintering machines. Materials control extends not only to the raw materials, but also to the sintering mixture. Closely related to materials control is the regulation of ignition and air supply. The second factor consists in the increase in machine dimensions, synchronizing of machine speeds with the control of sintering materials and improved regulation of air blast.

Continuous production of sinter having the proper structure and a minimum of fines depends to a large extent on close observation of raw materials and sintering mixture and on instant alteration of any of the functions of mixing, sintering or ignition equipment and of the fan or blower.

FINISHED SINTER IN RAILROAD CARS

Flow Sheet of Continuous Sintering Plant, American Sintering Co., from the Raw Material in Railroad Cars to the Finished Sinter, Also in Railroad Cars

Flue dust is admittedly an ore waste which up to the present has been unavoidable. It constitutes a burden on pig iron production costs, principally in the loss of the ore value. All flue dust can be sintered to a physical state superior to natural ores, at a fraction of the unit cost of equivalent ore.

Profits from sintering current make of flue dust are still greater than that from stock pile dust. In addition to the net gain on ore values reclaimed, this saves (1) cost of transportation to and from stock piles, (2) losses from the elements and (3) loss of unreclaimable dust from the ground storage.

Further, the use of 100 per cent sinter in the blast furnace will effect economies not believed possible heretofore. Indeed, the use of all-sinter is an accomplishment of very recent date. It is being done, however, by the Chateaugay Ore & Iron Co., Lyon Mountain, N. Y., where only sinter is used in the blast furnace. The E. & G. Brooke Iron Co., Birdsboro, Pa., uses 100 per cent sinter part of the time.

The continuous sintering process makes possible the high-quality sinter required to accomplish the results just mentioned, by reason of instant control of the complete cycle of operations, such as —

a—Proportioning the constituents of the charge,
b—Regulation of proper moisture,
c—Proper depth of bedding on the grates,
d—Correct intensity and distribution of ignition,
e—Constant observation and means of adjustment,

---

*Mechanical engineer, 110 Clinton Avenue, Clifton, N. J.

f—Control of time element of sintering zone,
g—Automatic synchronism of proportions and volume of feed to the demands of the sintering machine.

In addition, it makes possible the automatic control of uniformity of the sintering charge, provides means for inspection of grates outside of the sintering zone, and also makes provision for the replacement of grates without interruption of operations. The continuous discharge in a relatively small stream facilitates effective screening.

Sintering Machine Improvements

PREVIOUS to 1917 sintering machines were made in two sizes: 42 in. x 22 ft. and 42 in. x 25 ft. 6 in., the dimensions being those of the windbox area. Pallets were carried on wheels having plain journals. Pallets of the upper strand in the sintering zone were actuated by a pair of sprockets at the drive end of the machine, in engagement with the rollers of a pallet. The body of the latter served as a pusher for the entire load of sintering material in front of it.

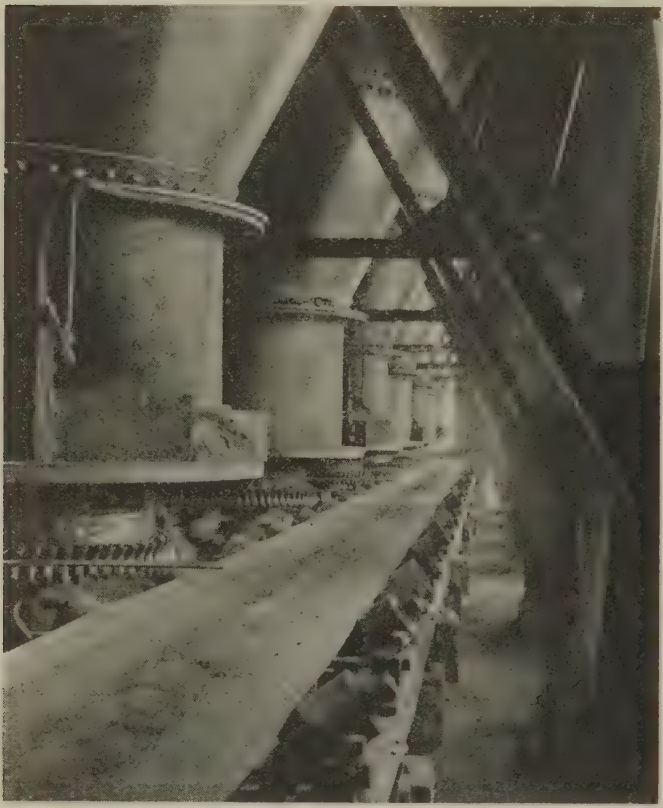

Fig. 1—Revolving Disk Feeders and Collecting Belt in Bin Building of Sintering Plant

The return strand traveled back by gravity on an inclined track to the starting point. Here the pallets engaged the sprocket teeth and were lifted into working position on the top of the machine. The transmission connecting the drive shaft to the countershaft consisted of several trains of spur gears between the pallet strands. The total reduction in average speed was approximately 2000 to 1, the low-speed gears being of the annular type connected to the drive sprockets.

Due to this construction, the drive shaft is not subjected to torsional strains. It therefore need not be so large as would be required with power transmitted through a spur gear on the shaft. At the same time, however, the intermediate gears, brought within the space between the strands of pallets, are exposed to the abrasive dust and grit from dropping sinter.

New Drive Avoids Dust Trouble

In the present design, sintering machines are operated through two countershafts and spur-gear reductions. The first countershaft is connected to a speed reducer which eliminates the intermediate gear trains. The larger size drive shaft required, because of the overhung gear drive, is offset by the freedom from abrasive dust trouble, and by the advantage of the inclosed speed reducer. The latter are usually Cleveland worm gears or Falk herringbone gears.

Pallets have been redesigned so as to be fitted with Hyatt or Timken roller bearings, and also as to the wind seal arrangement. In addition, the method of bringing the pallet to the sintering zone has been changed. The ends of the pallets have been designed so that they come in contact with faces on the sprocket teeth shaped in the form of a gear tooth. The wheels of the pallets roll on a curved track at the drive end of the machine, and the sprocket teeth in engagement with the back of pallets propel the latter around the curve.

This new arrangement eliminates a great deal of friction. It also avoids the occasional stoppage of the return pallet strand, immediately at the point of engagement with the sprockets.

Present designs of sintering machines are made in sizes of 42 in. x 57 ft. 4 in.*, 42 in. x 63 ft. 4 in. and up to 72 in. x 76 ft. 6 in. Accompanying the increase in grate areas, there has been also a gradual speeding up from the original 20 or 30 in. per min. to the present 90 in. per min. average speed.

How a Custom Plant Operates

To indicate more readily how the various function controls are effected, it is possibly best to describe briefly the equipment of a typical plant sintering flue dust. The American Sintering Co., Hubbard, Ohio, has developed a successful business devoted exclusively to the custom sintering of flue dust. The plant consists of trackage, trestles, conveying and mixing equipment, two 42 in. x 63 ft. 4 in. sintering machines, ignition system, blower, synchronizing controls, electrical equipment and dust-settling system. The flow sheet indicates diagrammatically the materials in process.

All incoming flue dust and outgoing sinter are sampled and weighed over a recording scale. When the flue dust is received in greater quantities than the capacity of the storage bins, it is dumped from the trestle into an ore yard alongside the track. It is reclaimed by a crane which drops it into track hoppers under the trestle.

Dust that can be handled in the plant is dumped into other track hoppers on the trestle. Each track hopper is fitted with a revolving disk feeder which feeds the material on to a collecting belt conveyor. The latter discharges to an inclined belt running at at angle to the collecting conveyor. The inclined conveyor discharges the flue dust into two revolving hexagonal screens for taking out over-size coke, which drops through a chute into railroad cars. It drops the fines into square storage bins, of which there are four, each having a capacity of 250 tons. Each bin is fitted with a revolving disk feeder at the bottom.

All feeders discharge to a collecting conveyor which takes the material into the sintering plant, where it is transferred to an inclined cross conveyor. This belt takes the material to a vertical belt and bucket elevator, which discharges to a double hopper over the sintering machines. The double hopper has a patented loading device, arranged so that, when material enters in excess of the requirements of the two sintering machines, a trigger arrangement will break an electrical circuit, thereby stopping the feeder motor. As soon as the level of the material in the hopper drops below a certain fixed point, the circuit is closed and the feeders are restarted.

The feed hopper is fitted with two revolving disk feeders, one for each sintering machine, the discharge from each feeder being received by a pug-mill which mixes and moistens the flue dust. Each pug-mill discharges to a sintering machine through a swinging spout, which distributes the material uniformly on the grates of the sintering machine.

Two heavy-duty type sintering machines are used. These machines, especially designed for the American Sintering Co. by the American Ore Reclamation Co., are 42 in. x 63 ft. 4 in. over the sintering zone, or the equivalent of approximately 222 sq. ft, suction area. Each machine is fitted with 84 grate-carrying pallets mounted on Hyatt roller bearing wheels, and is driven through two spur-gear reductions and one Cleveland worm-gear reducer. The latter is connected to a 10-hp.

---

*A machine of this size, at the New Castle, Pa., plant of the Carnegie Steel Co., was illustrated and described in THE IRON AGE of Jan. 17, 1918, page 200.

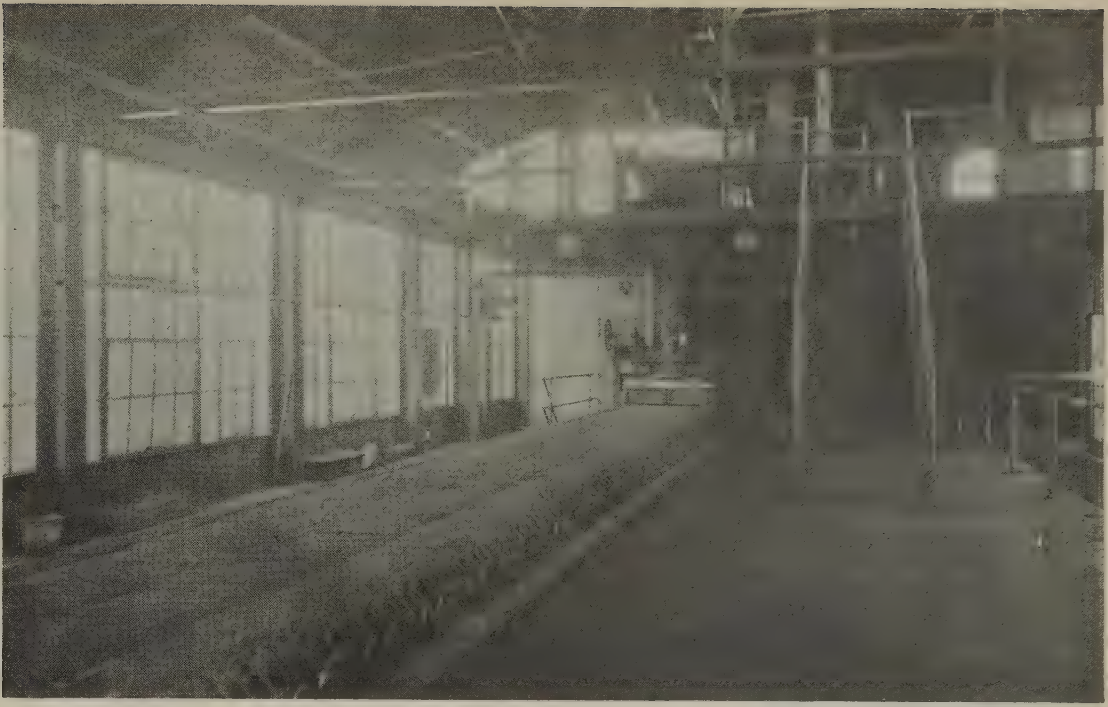

Fig. 3—Top Strand of Continuous Sintering Machine on Operating Floor of the Sintering Plant at Birdsboro, Pa., of E. & G. Brooke Iron Co.

motor by a flexible coupling. The sintering charge on each machine is ignited by an ignition furnace using fuel oil. The oil consumption is about 0.6 gal. per ton of sinter.

Combustion gases are drawn into a dust-collecting chamber through ten suction pipes on each machine. The gases within the chamber are divested of heavy particles by the reduction of velocity and the reversal of direction. These heavy particles then fall on to a film of water covering the sloping side of the chamber. The water and dust are washed into a Dorr rake classifier, where the fine particles are raked out of the water and on to the cross conveyor last mentioned. The latter returns the sludge to the bucket elevator, which in turn places the material for retreating.

Each dust-settling chamber is connected by a 60-in. gas main to a Buffalo 100-in. double-inlet, center-plate wheel fan having a capacity of 60,000 cu. ft. of free air per minute, under a pressure of 20 in. water gage. Each of the two fans is equipped with spherical, self-alining, water-cooled bearings. Each fan is directly connected to a 300-hp. motor by a flexible coupling.

Overflow water from the Dorr classifier flows through a tunnel into a sump, where the remaining fine particles of material are settled out. Periodically the sump is cleaned out by aid of a locomotive crane, which takes the sludge from the sump to railroad cars. The latter are then shifted to the trestle and discharged into the track hoppers.

Taking Care of the Product

Finished sinter is discharged over stationary grizzly bars into railroad cars. The fines are collected in so-called return hoppers, fitted at the bottom with revolving table feeders. These feeders drop the material on to the cross conveyor coming from the storage bins. This conveyor is at all times covered with flue dust, which serves as a protective layer against the hot returns. In this way sinter returns again enter the stream of the material to be treated.

In flue dust, the carbon content is usually higher than is required for maximum sinter production. The returns, which consist largely of fine particles of sinter containing no carbon, serve to lower the average carbon

(Concluded on page 243)

Manufacture Effectively Coordinated by Simple System

It is generally recognized that system, although a basic mechanism of administration, may be elaborated to the stage of too much "red tape," which acts to slow up rather than facilitate production. Avoidance of such over-elaboration has been a fundamental consideration of the Landis Machine Co., Waynesboro, Pa., in developing a production order system for the coordination of its manufacturing operations.

At this plant production orders are issued and returns collected by a central department. Each manufacturing unit receives copies of orders to be manufactured and is responsible for executing its operations economically, the latter being watched closely by the general superintendent through current cost records. Production for the most part is in lots for stock. The amount of stock carried is based on the sales experience of the previous few years, tempered by considerations of the immediate future outlook as arrived at by study of general conditions in the industries served by the company.

Manufacture comprises three more or less distinct divisions or departments according to products as follows: Pipe and bolt threading and cutting machinery, pipe die heads and chaser grinding machinery; chasers; die heads, marketed under the trade names of Land-Matic, Lanco, etc. Of the machinery, some 16 basic designs are produced and from these 300 different combinations, such as one, two or three-head machines, belt or motor drive, with or without lead screw, etc., can be furnished.

The machinery and pipe die heads, the production system connected with which is outlined in the following paragraphs, are manufactured in the general machine shop. The equipment in this shop is arranged according to the group plan, with milling machines in one group, turret lathes in another, etc. Manufacture is supervised by the general foreman

As Machines Are Assembled They Are Sent to the Testing Department to Be Tested for Accuracy of Alinement, etc., on the Class of Work for Which the Machine Is Intended

AFTER the General Production Schedule Has Been Drawn Up, Manufacturing Orders, Shown in Fig. 1, Are Issued. The work tag, Fig. 2, with time tickets, blue prints and operation sheets, is sent to the general machine shop, and material is requisitioned on the form shown in Fig. 3. The stores or stockroom requisition, Fig. 4, is issued to both stores and erecting department. The perpetual inventory of rough and finished material, respectively, is kept on the cards shown in Figs. 5 and 6. Cost records for every individual part of the machines and die heads are kept on cards, Fig. 7. In the case of abnormal cost of any item, the general superintendent is notified and a number of assistant foremen in charge of operations on the various groups of equipment.

The company maintains a production engineering department, which, in addition to being responsible for tool design, jigs and fixtures, etc., also analyzes operations, makes up standard operation-sequence sheets, determines standard speeds and feeds for various classes of work and makes time studies for use in establishing bonus rates. In this connection it should be mentioned that all workers are on a standard hour rate, with bonus for completing the work within the standard time, and an additional bonus for work done in less than the set time.

Production Orders Issued by Central Department

In the case of the machinery and pipe die heads, the production for stock schedule is drawn up every three or four months. Manufacturing orders are issued and records of finished parts and machines are kept by a production order department, operated in connection with the cost department. Schedules for stock, as well as for sales, are submitted by the management to the production order department, which makes up the general manufacturing order shown in Fig. 1. Several copies of this order are made, one each for the secretary (in charge of sales orders), the erecting and other departments.

Detail manufacturing orders are then issued for lots of individual parts that make up the machines listed on the general order. These detail orders include a rough casting order for the foundry, and a "work tag," Fig. 2, for the machine shop, which authorizes that department to proceed with the machining of the castings, forgings and other material. Materials obtained from outside sources are requisitioned through the purchasing department.

The work tag, time tickets, blue prints and the operation sheets furnished by the production engineering department are then sent in a tranparent envelope to the general machine shop foreman. The operation sheets, not shown, specify the sequence of operations for a given part, the sub-department and number of the machine on which the work is to be done, and the speed and feed to be used.

From the general machine shop foreman the envelope and its contents go to the assistant foremen in charge of the various divisions of the work. The latter see that all materials, tools, jigs and fixtures etc., are on hand for the prompt start of operations. When the assistant foreman is ready for material, he notifies the rough stores department, which delivers it immediately to the machines. This material has been assembled and held in readiness at the stores department, having been requisitioned by the production order department on the form shown in Fig. 3 at the same time that the detail orders were sent to the general machine shop. Jigs and fixtures are drawn ahead from the tool crib and set-ups are made in most cases by the workmen on the machines.

After machining, the parts are sent to the finish inspection department to be tested for size, and in some cases for hardness. The latter tests are to determine the condition of case hardened and other heat-treated parts after the machining operations. As each lot is inspected, the results are reported to the production order department, which posts the information in its record of the finished parts available. The inspected parts are delivered to the finished stock department.

When issuing the detail manufacturing orders, the production order department also issues the store or stock requisition shown in Fig. 4. This lists the various parts and sub-assemblies needed for the complete machines. It is forwarded to the erecting department foreman, giving him the authority to draw the necessary parts and sub-assemblies for each lot of machines.

Erection of the machines is in a large department which, like other sections of the plant, is arranged for the convenient and rapid movement of materials. As individual machines are assembled they are sent to the testing department to be tested for accuracy of alinement, adjustment, etc.—on the actual work for which the machine is intended. The machine is then moved to the painting department, and finally to stock, the production order department being notified accordingly.

Perpetual Inventory Kept

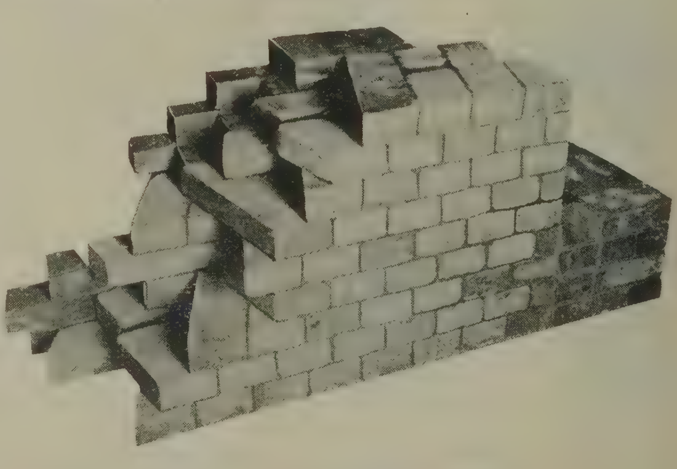
A perpetual inventory of all rough material to be machined or otherwise processed, as well as of finished parts and sub-assemblies, is kept by the production order department on the cards shown in Figs. 5 and 6, respectively. Records pertaining to finished machines and die heads are kept in loose-leaf ledger form. This ledger shows the number and location in the plant of completed machines and other products. Shipments from stock are recorded in the ledger, and note is made of the name of the customer in order to have convenient data for use in case of repairs, or duplication of the order in the future.

Close attention has been given to the matter of cost records, the system established being simple and thorough, as in the case of the production order routine outlined above. Cost ledgers are tied in with the general accounting system. Cost comparisons are frequently drawn up by the cost department for the superintendent and other executives, who use this in the general control of operations. The system includes the comparative cost cards shown in Fig. 7, which are kept for every individual part going into each machine and die head. These records, maintained over a period of years, permit convenient comparison of current costs with those of former periods. In case of deviation from what has been established as the normal cost of any given manufactured part, the cost department notifies the superintendent on a form provided for this purpose. This form shows the abnormal cost for lots of parts as they are manufactured and permits the superintendent to remedy matters before or while the next lot is in production.

Bricks with Bias Ends for Furnace Wall Construction

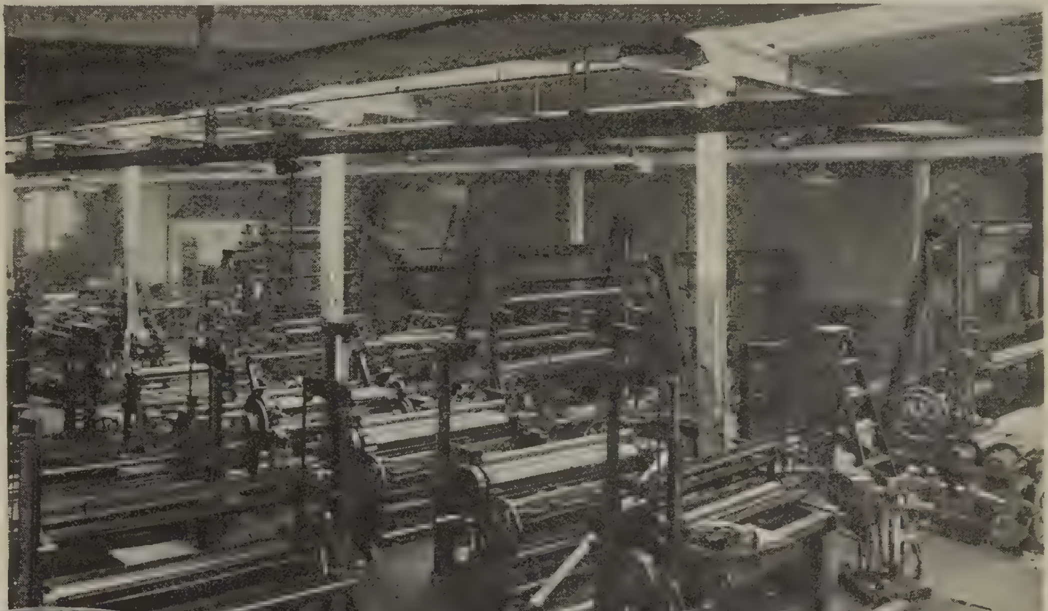
In the opinion of a great many engineers, one of the most difficult problems of furnace construction is to make fire brick stay "put" under actual working conditions. There is always the tendency for walls to loosen up and joints to open, resulting in heat losses, slag penetration and eventual disintegration. This problem of a stronger wall has been met by General Refractories Co., Philadelphia, by a unique shape called Biasbrix. As shown in the illustration, Biasbrix are laid up on an angle, one brick overlapping and tying together three others in a self-locking construction, that serves to produce a wall of unusual strength with tight joints.

Although different in shape, Biasbrix are found to meet requirements as readily as the ordinary straight brick in any thickness of wall from 4½ in. to 27 in. They seem to be particularly well suited for hollow wall construction, where a strong bond is of paramount importance.

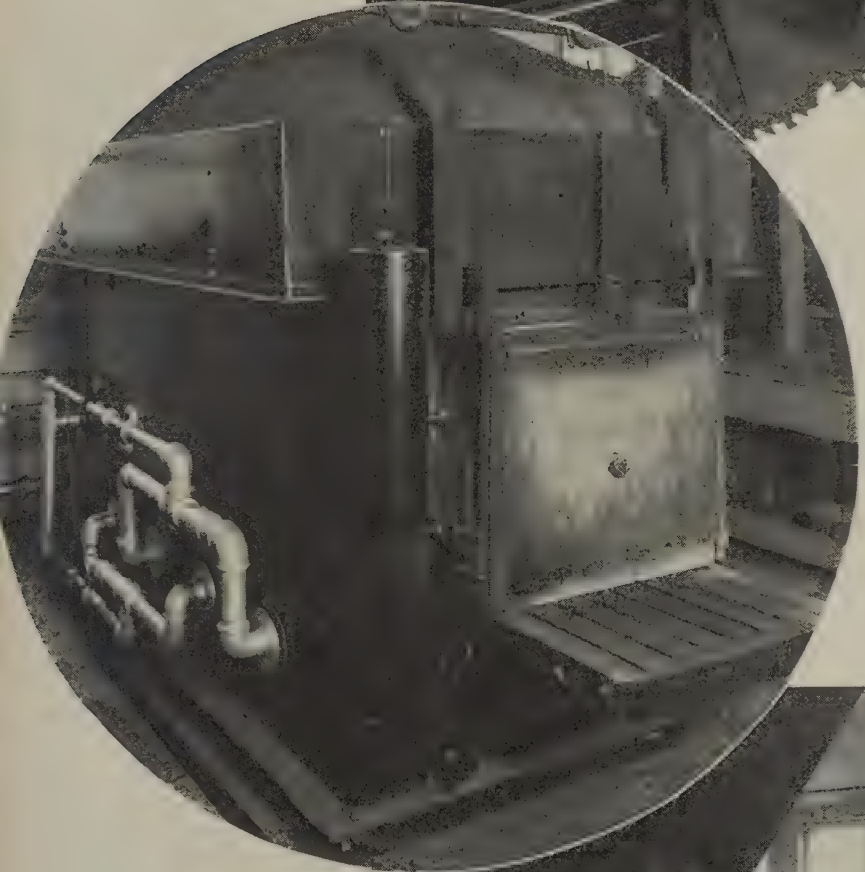


Hollow Wall Laid with Biasbrix

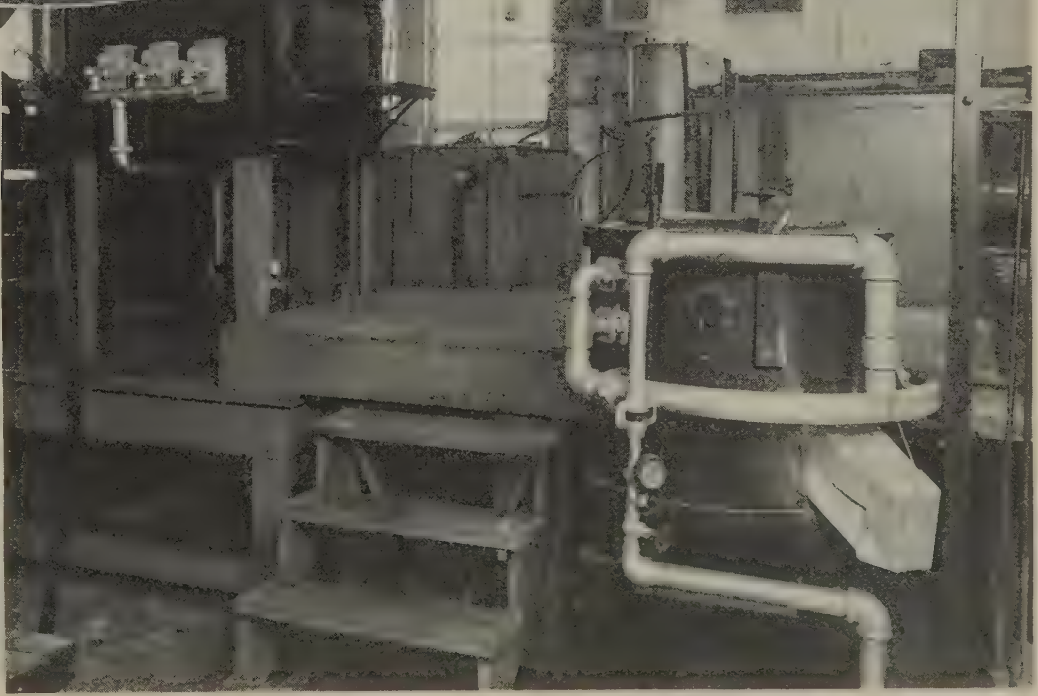
Gas Hardening Furnaces in Brooklyn Plant



THE Cameron Machine Co., Brooklyn, N. Y., makes slitting and roll winding machines. Some of its products are shown in this view of the assembly room of Camachines, as they are called in a coined name derived from the company's name.



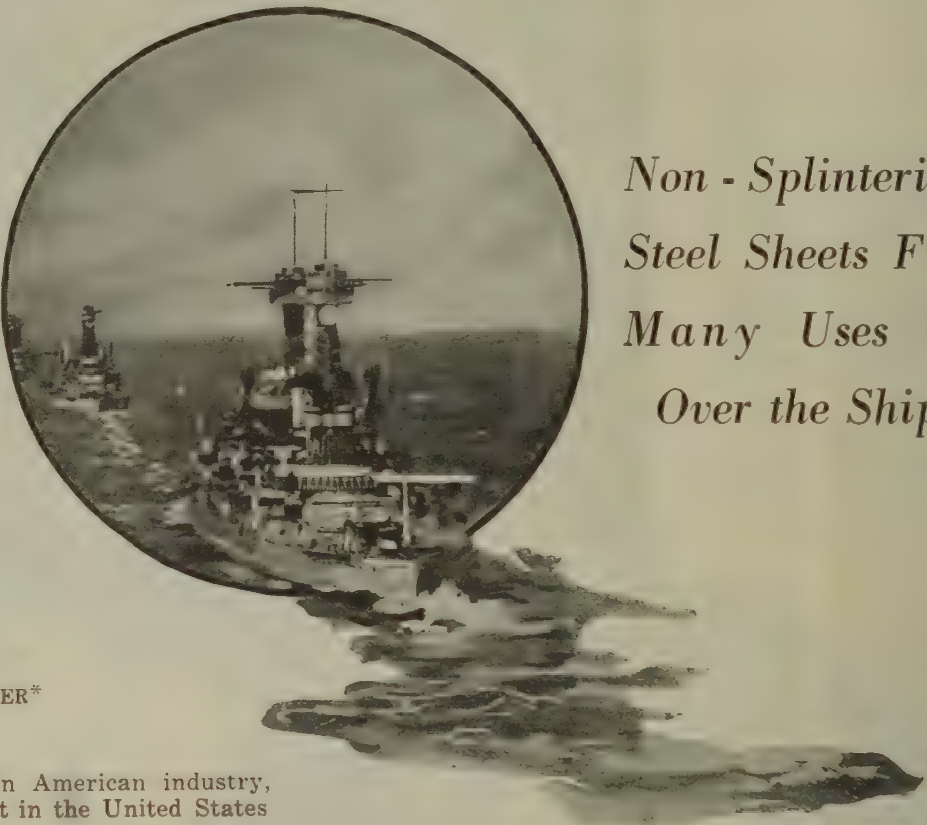
FOR the pack hardening or carbonizing of the platon rolls, cutting cylinders, etc., the steel parts are packed in bone or bonite, in air tight pots, and then heated for varying lengths of time up to 17 hr., when they are cooled from 12 to 24 hr., depending on the size. They are then heated again in another furnace and quenched in brine and oil for the final hardening. Gas is used for fuel under the Surface Combustion system, employing refractories which are kept at incandescence by the gas combustion. The venturi tube method of control is shown. Marked economies over open flame combustion are claimed.



A GAS fired furnace is employed for hardening the high-speed steel tools for the machine shop. Lead pots, similarly fired, are used for heat treating the cutters and other high-speed steel. Recording pyrometers are fitted to all the furnaces. The piping is painted with silver paint, to give instant notice of any leaks, as gas discolors such paint.

American Navy Uses More Sheet Steel

Its Quality of Absorbing Vibration Without Damage an Important Feature—



Non-Splintering, Steel Sheets Find Many Uses All Over the Ships

BY G. K. SPENCER*

SHEET steel, indispensable in American industry, also plays an important part in the United States Navy. Thin and sturdily tough, it hums to the cadence of whirling dynamos and turbines, while it also holds its steady place under the strain and tension of gunnery concussions.

One month before this was written, the battleship Nevada, for the first time in a modern navy, fired her guns† dead ahead. Ships habitually fire to port or starboard, so that the recoil can be absorbed by the roll of the ship. But in firing dead ahead the ship cannot roll; it must "sit back upon itself," and absorb the shock within its confines. It is equivalent to the ship's actually being hit by the shell. The Nevada was chosen for the test, to discover if a modern battleship could fire dead ahead without seriously damaging herself.

When the Nevada had fired dead ahead, she sat heavy in the sea, her bows submerged, her gun crews stunned momentarily by being cast against the sides of their turrets. But when the gun captains sang out through the voice tubes to the bridge, "Bore clear!" it was known that an American ship had successfully performed an internationally feared experiment. Now, if an enemy "crosses our T," or passes his fleet dead ahead of us, we know that we can fire on him.

Below decks the investigators found that all glass in the ship had been shattered, even wired glass. Slight strains were observed in beams and other pieces. But the sheet steel members had not yielded the fraction of an inch which was expected of them under the storm they endured.

Sheet Steel Held Its Position

In the main control room the sheet steel partitions were well in place; in the torpedo rooms the sheet steel partitions had not so much as cracked their paint. And so with the sheet steel partitions of the radio rooms, the fire rooms, and on all the gun decks. Sheet steel holds. In moments of disaster it never splinters —quite an estimable quality where confined space

ABOVE the Sailor's Head Is a Sheet Steel Coping Which Wards Off Wind and Rain from the Destroyer's Bridge (Heavy Seas, Too, of Course). The navy has found that shells cannot splinter it

Housings on Masts (at Head of Page) Are of Sheet Steel might cause accidents to assume greater proportions if splinters were to fly about.

---

*Maritime Air Service, Oakland, Calif.

†These guns, of 14-in. bore, throw a 1400-lb. projectile at a muzzle velocity of 2700 ft. a sec. The kinetic energy, for one gun, is 70,800 foot-tons. Five guns bear dead ahead.—EDITOR.

A piece of sheet steel from a Pittsburgh plant was placed on a hill on one of the naval proving grounds recently and fired upon with shell, without splitting in any manner, the bits of shell simply holing it, but not splintering it. This vindicated the naval policy of using sheet steel for cabinets, files, desks and all ship office equipment. In the event of the ship being in action with an enemy and shell pouring through the spaces reserved for control offices, the desks can be crumpled into cruel masses without sending splinters through the air to the further injury of personnel.

As a consequence of this policy, and also because the Bureau of the Budget insists on the economical operation of the Navy, every piece of office equipment of all combat ships—battleships, light cruisers, destroyers, submarines—is of sheet steel. If an enemy never shells them, then the equipment will last as long as the ship. In fact, if naval ships were to be scrapped today, the sheet steel office equipment could all be dismounted, detached and placed in other ships. It is not intended in the naval estimates ever to replace office equipment in the combat ships.

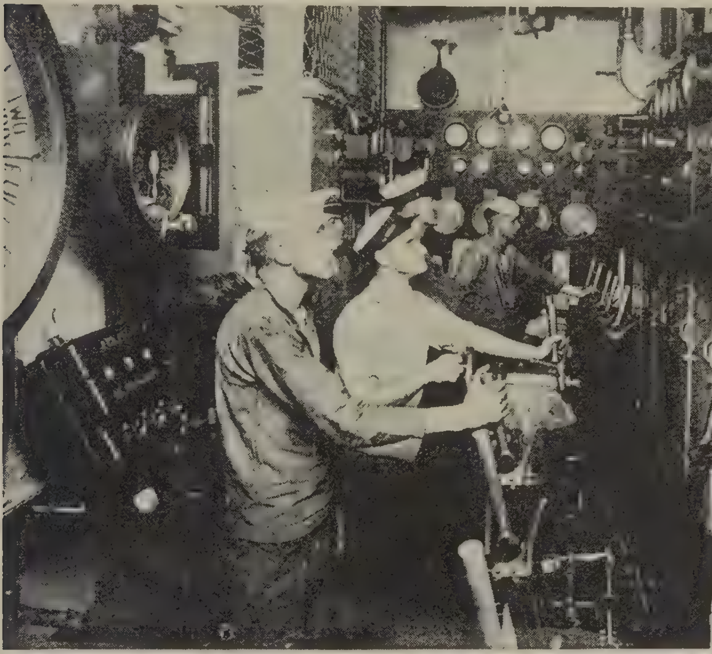
Desks, Lockers and Bunks of Sheet Steel

Seven first line destroyers of the Navy were wrecked on the rocks at Honda Head, Cal., in 1923. The ships were thoroughly "done up." Some even were turned upside down in several fathoms of water, with their hulls torn miserably, heavy loss of life having attended the accident. Pictures of the wreck on the morning after it occurred demonstrated how thoroughly the ships had been destroyed by wind, water and rocks. And yet, the sheet steel desks from those ships are today doing duty on other ships. They were not even bent—by storm, wreck or salvaging crews. And they had to be detached by divers under water.

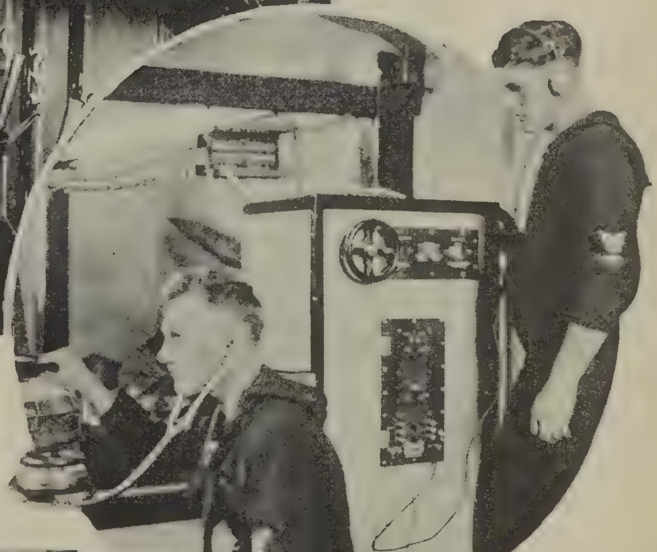
Your naval officer, after an arduous watch on deck, the bridge or the engine room, tumbles into a sheet steel bunk, made fast to the bulkhead in his room. The sailors pack their belongings in sheet steel lockers. The old-time sea chest is gone. In its place, the neat sheet steel locker possesses the dual advantage of indestructibility and not attracting vermin. Long rows of such lockers are mounted in all ships except aircraft and submarines.

A destroyer of the first line utilizes sheet steel for its bread, potato and vegetable lockers, and for its partitions below decks. All water and wind sheds on destroyers were recently converted, at the various navy yards on the Pacific and Atlantic coasts, to sheet steel construction.

Previously it had been termed objectionable to place sheet steel above destroyer bridges, to shelter personnel from wind and seas. Canvas was used to create an overhead which would serve as a wind and water shed. After the tests with shell on sheet steel, all destroyers



IN Right Foreground Is Shown Sheet Steel Partition in Main Control Room of U. S. S. Tennessee. Minor partitions throughout the ship are of this material



SONIC Direction Finding Equipment (Below), Made with Sheet Steel Cabinet

NAVAL Mess Room (Left), Showing Sheet Steel Lockers. Each battleship carries many hundreds of such lockers of the battle fleet on the Pacific Coast took turns going to the Bremerton Navy Yard to receive sheet steel overheads on their bridges. Sheet steel will not splinter in war and in peace it will last as long as the ship. As recently as three years ago our destroyers used canvas overheads on their bridges. Today they are all of sheet steel.

Observation Posts and Sounding Apparatus

Simultaneously, the observation posts in the cage masts of the battleships were converted to sheet steel, light and durable. Protection from enemy fire in the masts is naturally not seriously considered. It does not matter how heavy the sides of the observation lofts may be—if an enemy shell hits, it will carry that particular post away. In fact, lightness may save it more than weight, in the event of a hit.

With the advent of the sonic depth finding apparatus, by which vessels may make soundings by casting an oscillation toward the bottom of the sea and receiving it in another instrument, the Navy turned to sheet steel for the construction of this equipment. It did likewise with the direction finding apparatus, by which submerged microphones bring to a central collecting instrument the sounds made by the propellers of other vessels moving at sea. By this instrument, we discover if other ships are near, what type of vessels they are, and the speed and direction in which they are moving. The casements for these fittings are of sheet steel, the first two of the type being fitted on the Zeilin and Corry, of the battle fleet destroyer squadrons.

After the tests, within the fighting forces of the Navy, of sheet steel equipment for the office or "control" personnel, it was decided to make the ruling effective throughout the Navy, ashore in the Naval Districts, as well as afloat. Ashore it was not considered necessary to scrap all the desks immediately, but rather to replace them with sheet steel material as they are removed after long service. Consequently, all Naval Districts ashore today utilize sheet steel filing equipment, while retaining to a certain extent wooden desks. These latter will gradually disappear on land as they have at sea.

Metal Industries Expect 1928 to be "Fair" or "Good"

Business Survey by National Metal Trades Association Discloses Many Optimistic Opinions on Outlook for This Year

MEMBERS of the National Metal Trades Association, comprising many of the large metal-working industries of the country, are divided in their opinions as to the business outlook for 1928 between "fair" and "good." Of the replies received to a list of questions sent out from the association's office, 52.2 per cent predicted 1928 would be a "good" year, 34.75 per cent inclined to the view that it would be a "fair" year, while the remainder were divided between "extra good" and "poor" 7.25 per cent for the former and 5.8 per cent for the latter.

Many of the replies indicated reasons for expecting better business and only a few expressed the view that 1928 business conditions would not be so good as those in 1927. Broadly, the opinions indicate a belief that 1928 will be fairly prosperous, with no extraordinary increases or decreases in sales or operating volumes.

Among the conditions upon which optimistic expectations for 1928 are based are: Good crops, relatively cheap money, a flexible credit structure, small inventories, better possibility of export, low commodity prices and increase in stock orders; while actual orders booked and inquiries received recently, together with the possibility of increased automobile production, were taken into account also.

Some Companies Expect to Make Up for 1927 Recession

"Conditions in related trades exert a large influence on the prosperity of the metal trades," says a bulletin in which the association's questionnaire is analyzed, "and it is interesting to note that even in those industries faced with the most adverse conditions reported, there is still an underlying expectation of a steady flow of business. For instance, members associated with the coal mining and oil producing industries, both affected by overproduction in 1927, report good prospects for 1928. On the other hand, members in the automobile field report an excellent outlook for 1928, due to low production in 1927 and to the absorption of used cars. The re-entry of Ford into the market, coupled with new designs announced by other manufacturers, are factors expected to take up the slack caused by the 1927 recession.

"Members in close touch with the railroads and the textile industries report increasing activity in their markets, which leads to a general feeling of improved conditions for 1928. Members supplying the building trades do not feel an equal degree of optimism on the assumption that the general building shortage has been overcome. On the other hand, the extent of building permits being issued for 1928 erection opens the door for larger possibilities in metal building materials."

Replies to the questions sent by the association to its members showed that fully 50 per cent of those expecting a fair or good year base their expectations upon general economic soundness of American industry as a whole, and upon the special conditions obtaining in various members' own industries. About 30 per cent base their expectations upon the outlook in industries which they serve, while 15 per cent base their hopes on orders and inquiries already received. A few mention the political situation as affecting their business.

Some members reported a larger volume of business in 1927 than in 1926 with less profit, while others reported a smaller volume of business with greater profit. An increase in productive efficiency of plants was reported by 67 per cent of those replying, and the most important reasons underlying such increase in efficiency were: New or improved machinery, incentive plans of wage payment for workmen and supervisors, improved methods and processes, new buildings and equipment, better supervision, better tools, changes in personnel and training of employees.

Increased productive efficiency reduced the number of employees in 73 per cent of the cases where new methods or equipment have come into use, while 10 per cent definitely stated the saving in labor amounted to 5 to 10 per cent. A good many replied that increased quality production absorbed any saving brought about by greater plant efficiency.

Suggestions for improving working conditions and stabilizing business included the following:

Better education and training for all employees
Closer contact between management and men
General refusal to accept business at less than profit-making figures
Stop regulatory legislation
Better wages to employees through use of incentive plans of wage payment
Better purchasing practices
Standardization
Consolidations
Greater cooperation between employers
Production control
Budgeting
Renovating plant during slack productive periods
Improved cost finding
Personnel research
Better supervision
Better employment methods
Exercise caution in expansion
Developing new machinery

Inspection of Aircraft Tubing

Mild Carbon Can Be Separated from Alloy Steels After Normalizing by Testing Individually for Rockwell Hardness

BY HORACE C. KNERR*

IN the manufacture of seamless steel tubing such as is used in aircraft construction, and for many other purposes where accuracy and high quality are essential, the first operation is to pass the hot billet through a piercing mill, from which it emerges as a short, crudely formed tube or hollow billet. This is subjected to one or more stages of hot rolling over a rod, during which it is reduced to about 3 in. diameter, ¼ to ⅜ in. wall, 15 ft. or more long.

Manufacture Requires Repeated Handlings

Subsequent stages of manufacture consist in cold drawing through a die and over a mandrel to successively lighter walls and smaller diameters. The tube must be annealed after each pass to remove the hardness produced by cold work, and must be pickled after each annealing to remove scale or oxide. After pickling and rinsing the tube is coated inside and out with a lubricant, preparatory to the next cold pass. A tube of thin wall and small diameter may go through this series of operations as many as 25 times before reaching its final dimensions.

As the tubes are elongated on each passage through the die, they soon become too long for the draw bench or annealing furnace, and must be cut in two. These halves again are drawn and in their turn are cut in two when they reach a limiting length. From a single original billet weighing 75 to 100 lb., as many as a dozen or twenty tubes of thin wall may therefore be produced.

Many lots of tube in different stages of manufacture are passing through the cold drawing mill at one time. The lots are handled in bundles, consisting of a few dozen to a few hundred tubes, according to their size and weight. Each bundle is identified by a tag and a job card, on which its progress is recorded. The utmost care is given to the segregation of tubes of various types or analyses of steel in their progress, but in spite of this, human fallibility sometimes results during the many handling operations in placing a tube of one analysis in the wrong bundle, after which it loses its identity. This chance is not confined to the tube manufacturer's plant, but exists also in the user's shops and stock rooms.

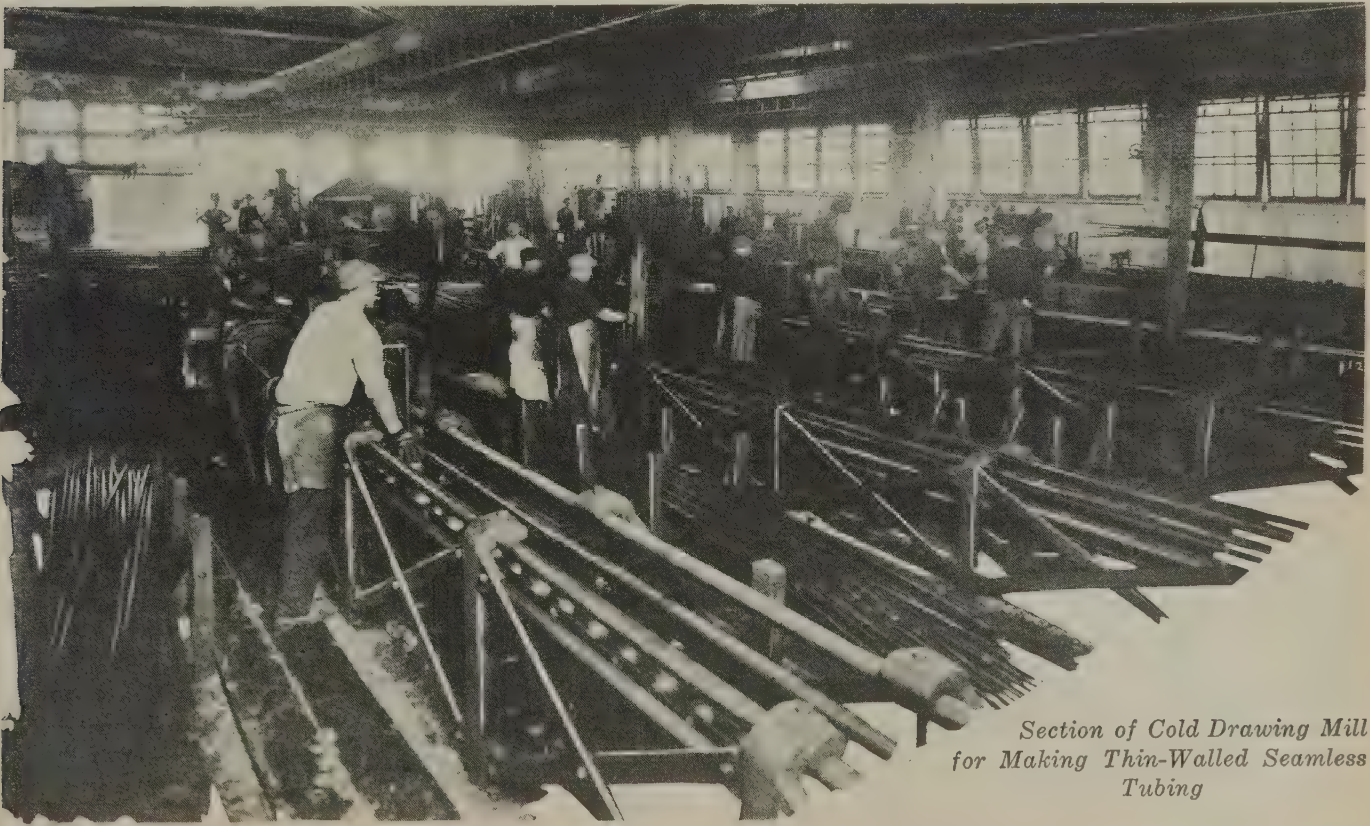
Segregation of Stock

In order to avoid the possibility of mixing tubing of ordinary commercial grades with those of the higher grades required for aircraft use, one of the Summerill Tubing Co.'s mills is devoted exclusively to the production of the latter. It is a complete unit in itself, including draw benches, annealing furnace, pickling tanks and necessary auxiliaries.

The aircraft industry, including the Army, Navy and commercial builders, have at present standardized on seamless tubing in three types of composition, as listed in the table of specifications. Any or all of these steels may be in progress through the mill at one time.

Because of its satisfactory fabrication qualities, and its excellent physical properties either as cold drawn, slightly tempered after drawing, normalized, or oil quenched and tempered, chrome-molybdenum steel is finding wide application, not only in the construction of aircraft, but in a wide variety of industries where requirements are exacting.

The two alloy steels do not differ widely in their physical properties, either as drawn or after like heat treatments. If one or more tubes of one type became mixed with tubes of the other type, and heat-treated accordingly, the properties obtained while not the best would not cause danger. Moreover, no trouble should



Section of Cold Drawing Mill for Making Thin-Walled Seamless Tubing arise from mistaking an alloy steel tube for one of mild carbon steel, since its physical properties would be superior.

---

*Consulting metallurgical engineer, Summerill Tubing Co., Bridgeport, Pa.

But if a tube of a mild carbon steel became mixed with a lot of either 3½ per cent nickel steel or of chrome-molybdenum steel, serious results might follow, since its strength would be much less than that of the alloy steel for which the structure was designed. Therefore it is imperative to apply a final test to *each individual tube* in a lot of alloy steel of either type, to insure that no mild carbon steel tube is present. (Of course, the same situation exists with tubing, bar stock and finished parts in the aircraft manufacturer's plant.)

Positive Identification of Nickel Steel

There is a very simple, convenient and reliable test for the identification of nickel steel. This consists in putting a drop of 50 per cent nitric acid on the cleaned surface, soaking up the drop after reaction is completed (in about thirty seconds) on a sheet of filter paper or white blotting paper, and applying to the wet spot on the paper a few drops of a di-methyl-glyoxime solution. This is made of 1 gm. di-methyl-glyoxime, 60 cc. of 80 per cent acetic acid, 30 cc. concentrated ammonia and 10 gm. ammonium acetate. If nickel is present the spot will turn strawberry pink; in the absence of nickel, the spot is reddish brown. The indication is quite distinct and positive when the test is properly performed, and a large number of pieces can be tested in a short time.

Unfortunately, no simple, rapid and thoroughly reliable chemical test seems to be available for identifying chrome-molybdenum steel.

Hardness of Normalized Chrome-Molybdenum Tube

Consideration has therefore been given to the hardness test as a means of identification. Neither the Brinell nor the scleroscope test is suitable for use with thin-walled tubing, but the Rockwell hardness test is well adapted to the purpose.

Preliminary experiments showed that no clear distinction could be drawn between the Rockwell hardness of mild carbon and chrome-molybdenum steel tubes, as they came from the mill after drawing. However, after normalizing, i.e., heating above the critical range and allowing to cool in the air with free circulation, chrome-molybdenum steel tubes of aircraft sizes show a Rockwell hardness of 90B or over, while mild carbon steel gives a hardness below 80B. (When it is not practicable to normalize the whole tube or its end, a sample may be cut, normalized in a small laboratory furnace and tested.)

The investigation verifying this test over the range of thickness and diameter of tubes used in aircraft construction has additional interest in showing the physical properties obtainable by normalizing these steels.

Tests of Thin-Walled Tubes

Nine mild carbon steel tubes and nine chrome-molybdenum steel tubes were tested in three diameters representative of aircraft sizes (½, 1 and 1¾ in.), each diameter in three wall thicknesses (B.W.G. 20, 16 and 11; respectively 0.035, 0.065 and 0.120 in.). Tubes were taken at random from stock, suitably numbered and cut into sections 10 in. long.

A series of eighteen specimens, as above mentioned, was normalized at each of the following temperatures: 1400 deg. Fahr., 1490, 1580 and 1660. The specimens were held at temperature for 15 min., withdrawn individually and supported horizontally about 2 ft. above the floor so as to permit free circulation of air. They cooled to blackness within 1 min. or less. The tubes were not tempered after normalizing.

Some very light scale was produced during cooling. The scale on the chrome-molybdenum steel peels off freely, while that on the carbon steel adheres. This serves as a fair but not very positive distinction. It is important to remove this scale both inside and out at the point tested.

Rockwell hardness tests in triplicate using 1/16-in. ball, 100 kg. load, were taken on all specimens, including a set from the tubes in the original condition (as delivered by the last drawing bench). Individual readings on any specimen usually fell within plus or minus 2 points of the average.

For thin-walled tubes, a special anvil was used, consisting of a rounded head supported on a curved arm in such a way that the end of a tube may be slipped over the head, which then supports the wall from the inside. The head has a radius of about ¼ in., but is slightly flattened on top, so that it makes the least possible indentation on the inner surface of the tube. Another special anvil for small tubes consisted of a piece of hardened drill rod, 3/16 in. diameter, ½ in. long, extending horizontally from an upright arm. Readings taken with these anvils on a test block of known hardness are two to five points lower than with a flat anvil, due to a scarcely perceptible indentation made by the anvil on the under side. However, the results on such special anvils are consistent, so that a correction can be made. No other equally practicable method was found to test thin-walled tubes.

No specimen of the annealed carbon steel lot showed a hardness exceeding 80B. Three specimens of annealed chrome-molybdenum steel lot showed a hardness less than 90B, which were set aside as doubtful for further investigation.

No consistent relation between hardness and tensile strength of normalized tubes was observed, except the following general ones: Rockwell hardness over 90B corresponds to tensile strength over 95,000 lb. per sq. in. Rockwell hardness under 80B corresponds to tensile strength under 75,000 lb. per sq. in. This, however, is a check on the satisfactory strength of normalized chrome-molybdenum steel tubes.

Specifications for Standard Aircraft Tubing

	Mild Carbon	3½ Per Cent Nickel	Chrome-Molybdenum
Specification—			
U. S. Army Number	57-180-1	......	57-180-2
U. S. Navy Number	49-T-1	49-T-2	......
S. A. E. Steel Number	1025	2330	4130 X
Chemical Composition—			
Carbon	0.20 to 0.30	0.25 to 0.35	0.25 to 0.35
Manganese ...	0.50 to 0.80	0.50 to 0.80	0.40 to 0.60
Phosphorus (max.)	0.045	0.040	0.040
Sulphur (max.)	0.050	0.045	0.045
Nickel	......	3.25 to 3.75	......
Chromium	......	......	0.80 to 1.10
Molybdenum ..	......	......	0.15 to 0.25
Minimum Physical Properties—

Yield point (dividers) ..	36,000	100,000	60,000
Elongation in 2 in., per cent.	22	12	12
Heat treatment..	Normalized or As Drawn	Quenched and Tempered	Normalized or As Drawn

Normalizing Temperature Range

When the mechanical properties were plotted against normalizing temperatures for tubes of a given diameter, little effect on the hardness or tensile strength values was found within the range of 1490 to 1660 deg. Fahr. At 1400 deg. Fahr. there is a general tendency for all values to fall. This temperature is too low for satisfactory results. Any temperature between 1500 and 1600 deg. Fahr. would appear to be satisfactory for normalizing, although narrower limits could readily be maintained.

In general, hardness and strength tend to increase with decreasing wall thickness, but there are numerous exceptions to this rule, due perhaps to slight variations in composition, or other factors. Within the range of ½ in. to 1¾ in. at the various gages and temperatures, diameter has little effect on the strength of tubes of either analysis under test.

Chemical analyses of each tube under test were made. The carbon steel tubes ranged from 0.17 to 0.31 per cent carbon, and each gave negative results in a qualitative analysis for chromium, molybdenum, nickel, vanadium and tungsten.

It is significant that one tube, namely 1¾ in. by 0.120 in., from those supposed to be chrome-molybdenum steel tubes, contained only 0.06 per cent chromium and 0.07 per cent molybdenum and was therefore defective in composition. The four specimens from this tube showed inferior physical properties, and Rockwell hardness in the neighborhood of 80B. The proposed test therefore served to distinguish this tube from the good ones.

Inspection of Chrome-Molybdenum Tubing Before Shipment. Each tube is normalized and given Rockwell hardness test

Another tube from the chrome-molybdenum steel lot showed erratic Rockwell hardness, although the tensile properties were excellent and the composition normal. Under the Rockwell inspection test this tube would have been withheld, subject to further test or other disposition by the manufacturer, and therefore without risk to the purchaser.

Conclusions

The results indicate that, within the range of diameters from ¼ in. to 1¾ in., and thicknesses from 0.015 in. to 0.120 in.:

1. After normalizing, that is, allowing to cool freely in air, from a temperature between 1490 and 1650 deg. Fahr., tubes of 4130X steel may be distinguished from tubes of 1025 steel which have been mixed with them by means of a Rockwell hardness test. The former will exceed 90B, while the latter will be less than 80B. Any tubes of intermediate hardness may be regarded as doubtful, subject to further verification, or rejected.

2. Without normalizing, the Rockwell hardness does not clearly distinguish between tubes of these two steels.

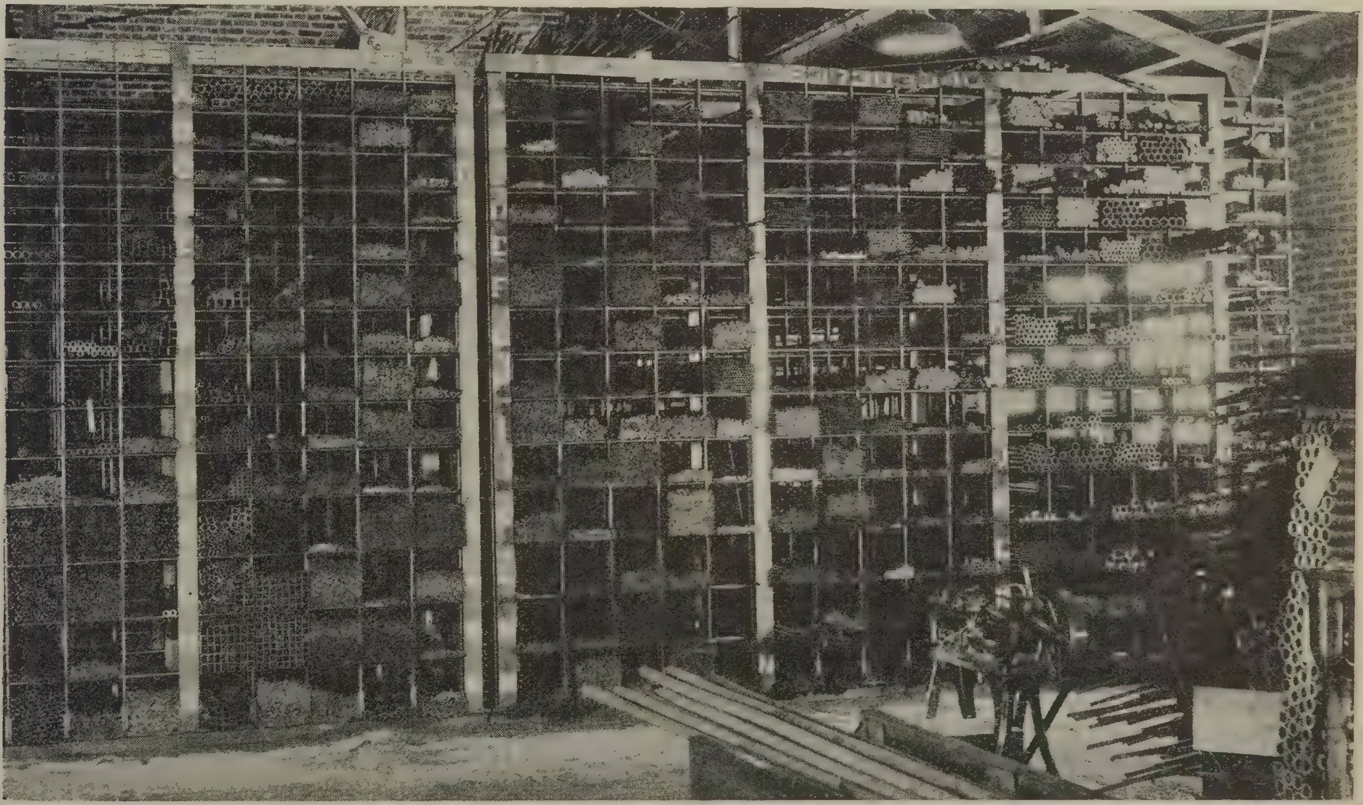
3. Rockwell B hardness is not directly proportional to tensile strength for either type of steel, but if the hardness is above 90B, after normalizing at 1490 to 1660 deg. Fahr., the tensile strength of 4130X tubes is above 95,000 lb. per sq. in.

4. The normalizing range is wide, variations in temperature between 1490 and 1660 deg. having little effect on hardness or tensile values. A temperature between 1525 and 1575 deg. Fahr. is to be preferred, so that scale will be a minimum.

5. The test is rapid, inexpensive and can be performed by a relatively unskilled operator. Errors, should any occur, are likely to cause the rejection of good tubes due to low hardness readings, rather than the acceptance of inferior tubes.

6. This test is not suitable for separating chrome-molybdenum steel tubes from tubes of high carbon or other alloy steel, as these would probably have similar hardness values after normalizing.

The Rockwell hardness test described has been approved by the Navy Department, and is being applied to every tube of chrome-molybdenum steel No. 4130X, before shipment by the Summerill Tubing Co. After more than six months of this practice, during which thousands of tubes have been tested, there has not been an instance when the test failed in its reliability when properly performed.



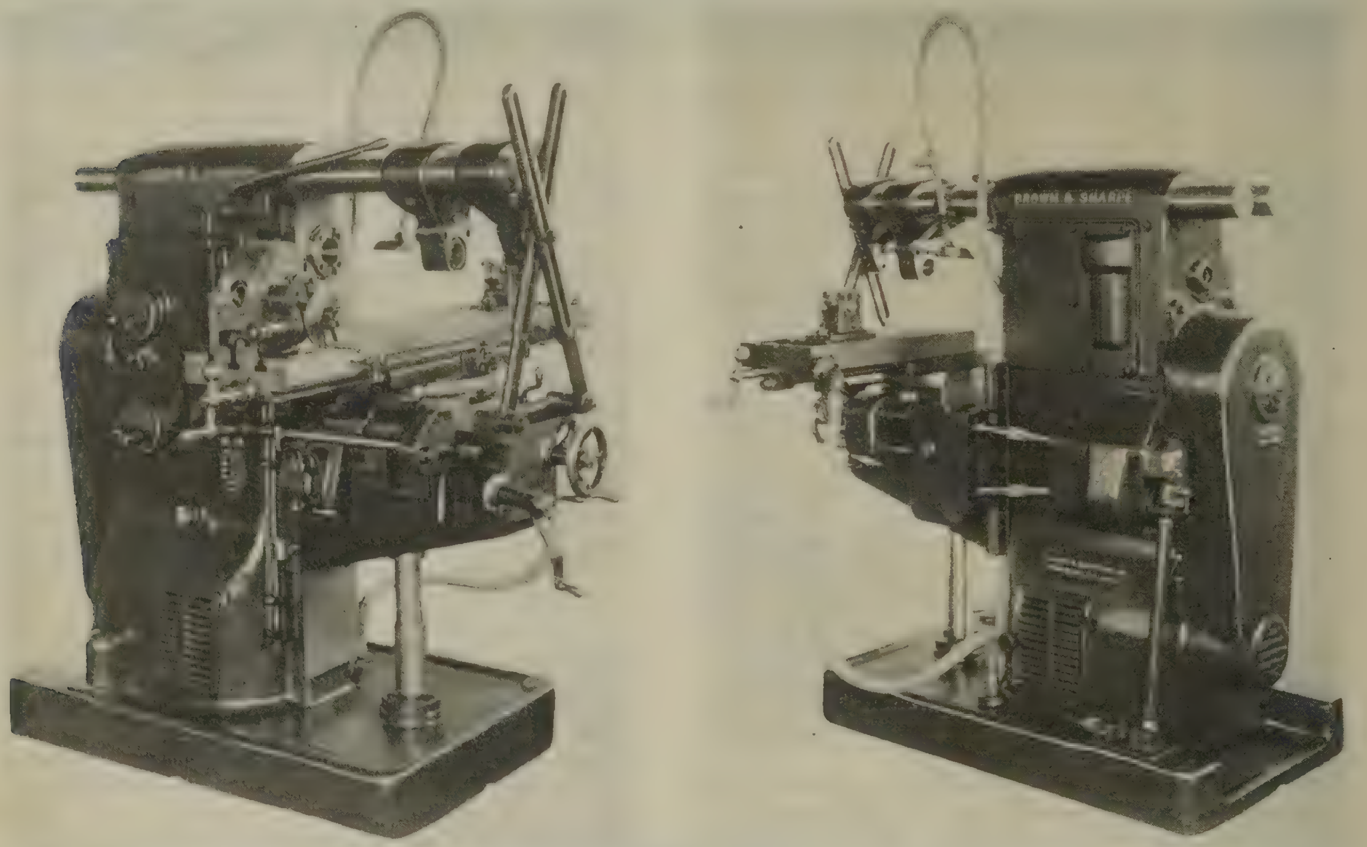
Stock Racks in Warehouse. A wide variety of sizes and shapes, often in more than one analysis, is demanded by the trade

NEW MILLING MACHINES

Dual Feed Control—Either at Front or Rear of Table—An Outstanding Feature

A NEW line of milling machines with features that simplify control and facilitate operation has been brought out by the Brown & Sharpe Mfg. Co., Providence. The line is designated as the Standard and includes Nos. 2-A and 3-A universal and Nos. 2-B and 3-B plain machines.

Features intended to facilitate operation include a single lever for speed changes (in two series); and a single lever for feed changes at each of the operating positions, front and rear of the table. Direct reading dials indicate rate of feed and speed engaged. Power fast travel is provided in all directions, this being gear driven through safety clutch. Directional feed engagement levers for all feeds are provided at front and rear of table, and the knee is arranged for clamping from front or rear of the table.



Feed Changes Are Made by Rotating the Lever at the Front or at the Rear of the Table. One revolution in either direction accomplishes a change, and direct reading dials indicate the feed in use. Power fast travel is provided on all three feeds

The dual feed control permits the operator to make feed changes from either the front of the machine, in the normal operating position, or at the rear of the table, for face milling, boring, etc. Changes are made by the simple rotation of a single lever and the feed in use is shown on a direct reading dial directly above either control lever. Only the feed in use is shown, which is a convenience not only for the operator, but also for the foreman, who can see at a glance if suitable feeds are being used for the work in process. All controlling levers are always thrown in the direction of the movement of the table, which further simplifies operation of the machines.

One revolution in either direction of a single lever on the left side of the machine gives a change of spindle speed, and a direct reading dial above the lever indicates the speed for which the machine is set. Two series of speeds are available, the change from one to the other being made by shifting the back gear lever. Spindle reverse is controlled by a small handle just below the speed change lever.

Oiling of the machine is by means of a simplified system. All units in the column and driving clutch are automatically supplied with filtered oil and a gage is provided to indicate whether the pump is working. The inside of the column is coated with a special enamel to prevent grit in the casting getting into the lubricating system, while the complete inclosure of the column mechanism prevents the entrance of foreign matter. The knee mechanisms are lubricated by a pump which automatically forces oil to all moving parts. The entire saddle mechanism and table bearings are oiled from a single conspicuously placed well at the front.

The cutter coolant system is designed to provide either a flood supply or a thin stream. In either case, it is delivered at low pressure and the pump arrangement is simple and requires little attention. The pump is always immersed and automatically stops when the spindle stops.

The machines are of rugged construction and all assemblies are of unit construction. It is equipped with a double overarm and the standardized spindle end and is adapted for motor drive. Sliding gear feed and speed transmissions; all-gear drive, with heat-treated alloy steel gears; and anti-friction bearings from the driving pulley to the spindle, as well as in the feed and power fast travel mechanisms, are other features. The spindle runs in phosphor bronze bearings. Power is transmitted through a dry type multiple disk clutch, which is self-compensating for wear. The elevating screw is of one-piece construction, completely inclosed, which construction is said to provide unusual accuracy in vertical adjustments.

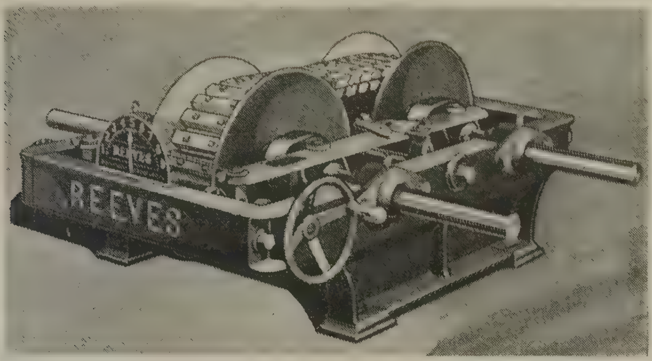
Steel Foundry Operates 100 Days Without Lost-Time Accident

Employees of the Union Steel Casting Co., Pittsburgh, recently observed the successful completion of 100 days without a lost-time accident with a safety rally at the plant. Safety drives by the company were inaugurated in November, 1926, and the 100-day period, ended Nov. 30, 1927, established a new record. At present the plant employs 400 men, and the effectiveness of the campaign is further stressed by the fact that jobbing steel foundries are generally classed as "extra hazardous." Safety work at the Union plant is in charge of D. J. Evans, superintendent. He is assisted by K. C. Wickline, safety engineer, and by a safety committee consisting of all department foremen and their assistants, together with the officers of the Employees' Beneficial Association.

Improved Model of Reeves Variable-Speed Transmission

Improved features intended to provide additional strength, greater compactness and higher efficiency have been incorporated recently in the variable-speed transmission of the Reeves Pulley Co., Columbus, Ind.

A new double-block center-pull V-belt is said to provide more than twice the surface contact against the driving disks of the transmission, assuring maximum strength, quietness and a more efficient transmission of power. Through this double-block construction the center line of pull is at the center of the belt body, and the load is evenly distributed above and below. The end tips of the belt block are shaped by a special process to conform to the curved surface of the driving disks, providing a snug fit which is said to assure positive flow of power at all speeds. High efficiency is also attributed to the fact that the belt can be run at slack tension, which lengthens the life of the belt and reduces the load on the driving parts of the transmission.



A New Double-Block Center-Pull V-Belt Has Been Provided and Bearing Housings Are Now in the Frame Sides

The new transmission is equipped with a splice-block of the double-pin interlocking type, with cast aluminum blocks and tool steel plates. The machine is shorter and narrower than previously. Reduction in width has been accomplished by setting the frame bearing housings in recessed grooves in the frame sides. This brings the bearing housings closer together and, in addition to the saving in space, makes the drive shafts stronger and more rigid. The overall length of the transmission has been materially reduced by eliminating excess clearance between the ends of the disks and the frame. The feet of the new frame are planed to accurate dimensions.

Improvements have also been made in lubrication. The bore of the disk hub is now grooved spirally, providing more uniform lubrication to all parts of the disk hub bore, shaft, and driving keys. This is said to provide free sliding of the disks on the shafts and to facilitate shifting of speeds. Standard equipment includes a speed indicator which is mounted on the transmission frame.

New England Foundrymen Elect Officers

The New England Foundrymen's Association held its thirty-second annual meeting and dinner on Wednesday evening, Jan. 11, at the Exchange Club, Boston. The only business transacted was the election of officers for 1928, the evening being given over largely to entertainment. H. S. Chafee, Builders' Iron Foundry, Providence, R. I., retiring president, presided until his successor, Charles F. Miller, Universal Winding Co., Providence, was elected. Carl H. Neumann, Union Mfg. Co., New Britain, Conn., was elected vice-president. George H. Gibby, Gibby Foundry Co., East Boston, was reelected treasurer, and Fred F. Stockwell, Barbour-Stockwell Co., Cambridge, Mass., reelected secretary, positions they have held many years.

The executive committee for the year consists of Ernest F. Stockwell, Barbour-Stockwell Co.; William W. Brierly, Millbury Steel Foundry Co., Millbury, Mass.; H. A. Lincoln, Sullivan Machinery Co., Claremont, N. H.; Luther J. Anthony, Glenwood Range Co., Taunton, Mass.; and Charles A. Reed, Rogers Brown & Crocker Brothers, Inc., Boston.

Yale K24C Tractor Has 4-Wheel Drive and Sturdy Frame

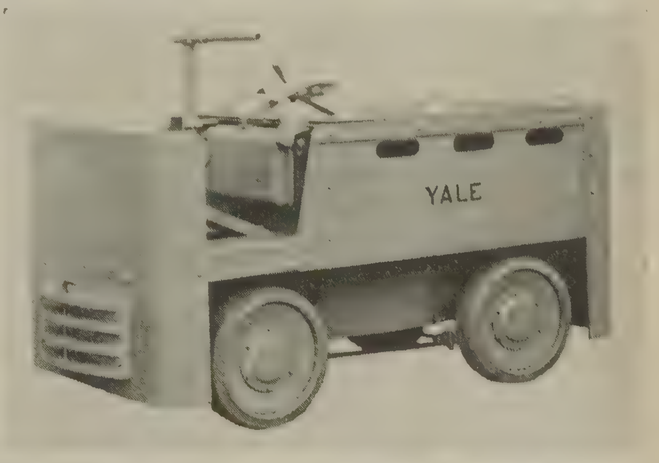
A four-wheel drive tractor has been brought out by the Yale & Towne Mfg. Co., Stamford, Conn., to meet the demand for an electric tractor of heavier type. The machine is capable of an ultimate drawbar pull in excess of 4000 lb., depending upon road surface conditions. It will operate a continuous drawbar pull of 1000 lb. without danger of overheating. By driving all four wheels of the machine, it is possible to get the maximum of traction with a given overall weight. This feature is particularly advantageous when the tractor is driven outdoors, between buildings, over ice and snow. It has the same advantage when operating over floors covered with oil.

With four-wheel brakes, not only has the machine power to pull on slippery surfaces, but it has also the power to stop. As the brakes operate through the differentials, they properly equalize, regardless of the condition of the lining. A spring automatically applies these brakes when the operator either raises his foot pedal or steps off the machine. Disarrangement of the linkages between foot pedal and brake lever would in no way hazard the driver. Should this linkage fail, the brakes would immediately apply and give warning that something was wrong.

Steering is through a lever handle arranged to fold up out of the way if the driver wishes to leave his seat. Construction of this folding linkage is rugged. The steering knuckles on all four driving wheels are equipped with ball flush bearings. This is important, as it permits the driver to whip his machine quickly in tight places, thereby gaining every inch of the turning radius of which this machine is capable.

Two standardized driving units are connected in parallel at the controller. Employment of standard units allows a maximum of interchangeability in the hands of the customer. He need maintain but one set of repair parts for all of his Yake truck and tractor models. This machine is regularly furnished with a 48-volt motor, and a 23 to 1 gear ratio.

The frame construction is unique in that the pressed steel side members or main supporting members are strong and integral parts with the axle yokes. This gives the frame a depth of 18 in., producing a member capable of standing jolts and jars in addition to the bending stresses to which it is subjected. The bumpers are heavy, being made of ½-in. plates. A triple bumper casting front and rear gives a range of coupling height to meet most requirements.



Both 4-Wheel Drive and 4-Wheel Brakes Feature This Electric Tractor

The Aluminum Co. of America has bought two 45,000-kva. water-wheel alternaters and seven 15,000-kva. transformers from the Westinghouse Electric & Mfg. Co., and two 45,000-hp. water-wheels and the governors from the Allis-Chalmers Mfg. Co., for its Calderwood, Tenn., hydroelectric development.

The National Foreign Trade Council will hold its fifteenth annual convention at Houston, Tex., April 25-27. O. K. Davis, India House, Hanover Square, New York, is secretary.

Business Analysis and Forecast

BY DR. LEWIS H. HANEY

DIRECTOR, NEW YORK UNIVERSITY BUREAU OF BUSINESS RESEARCH

Current Statistical Data, Considered Independently of Trade Opinion, Indicate That:

Steel ingot output (adjusted) increased sharply in December and probably will continue upward.

Unfilled orders showed the largest increase in three years, indicating, on the basis of past history, that prices are due to advance.

Pig iron production continues below normal, but still is large in comparison with ingot output and price recovery does not seem imminent.

Finished steel prices are still too low for a proper relation with their raw materials.

IN a good many respects the conditions now prevailing in the iron and steel industry are like those which usually are found at the bottom of a downward swing, just preceding an upward turn. It is usual in this industry for production to expand before prices rise. This is particularly true in the case of finished steel prices. In 1921, the production of steel ingots showed a rising rate about seven months before the average price of finished steel began to advance, and in 1924 there was a similar period of about four months. At present the reasons for this lag are being illustrated.

Sensing the apparent fact that steel prices have gone about as low as can be expected, buyers have placed large orders at those prices and steel production has been stepped up accordingly. The market now awaits the usual "testing period" when buyers will be asked to take steel at the higher prices, to avoid which they recently made purchases. If the usual sequence of events is to follow, the market will stand the test and prices will advance further.

Higher Prices Expected

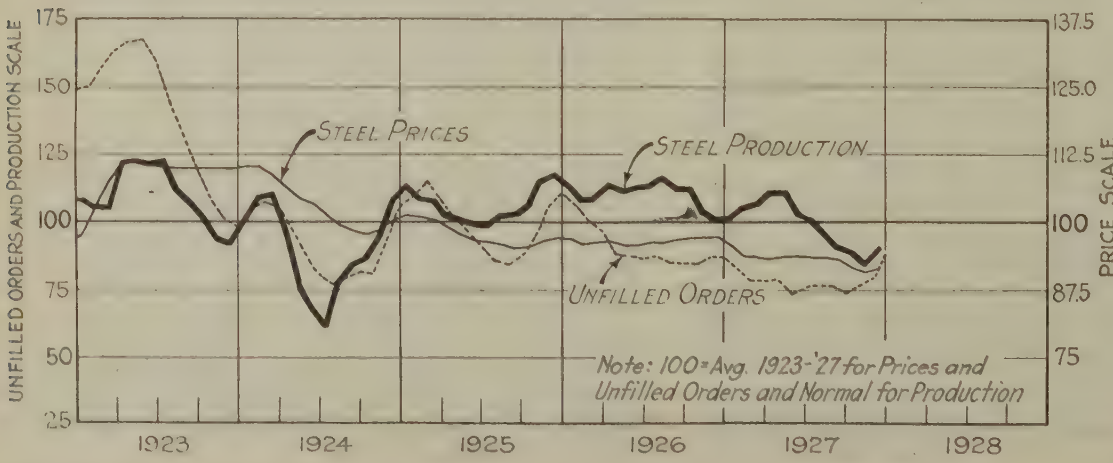
We have from time to time suggested that production has been so well adjusted to consumption, and that as a result there has been so little accumulation of stocks, that the usual lag between increased production and higher prices is not likely to occur at this time. The fact that THE IRON AGE composite price of finished steel rose in December at the same time that production increased seems to give some force to this suggestion.

It is also true, however, that there has been no such severe curtailment of production as occurred in 1921, or even in 1924, and that consequently there is no great shortage. It may well follow that, while the decline in prices has been checked earlier than in most other similar periods, there will also be a less sharp expansion in the demand for steel, and that the anticipated rise in prices will not gain such momentum as would otherwise be the case. For example, we see no prospect whatever of such an advance in steel prices as occurred in 1922.

Production Curve in Steel Is Headed Upward

DISREGARDING trade sentiment and the hopes and doubts which it involves, the cold statistical record looks favorable. One depending entirely on the showing made in the first chart would necessarily draw this conclusion. It should be noted that the chart gives a truer picture of the trend of the steel industry than can be secured from the usual statistical statements. The merely seasonal variations which occur from month to month are practically eliminated. In the case of steel production, allowance is made for the normal annual rate of growth which occurs over a long period. Each of the "curves" is measured from the average for an appropriate period of years. Thus, without attempting any forecasting, the chart is important as revealing the present true underlying position and trend of the industry.

It shows that the December average daily production of steel increased more sharply than in any previous month in over a year. Our adjusted index is 89.8 per cent of normal, against 85.1 per cent in November. It compares with 103.7 a year ago, but last year the trend in December was downward. In view of the sub-normal rate of production, and the infrequency with which the production curve reverses itself after



Note: 100=Avg. 1923-'27 for Prices and Unfilled Orders and Normal for Production

Fig. 1—Steel Production Increased More Sharply in December Than in More Than a Year. Prices, after Sagging for months, seem to have turned upward. Unfilled orders have made up all the loss of the earlier months in 1927

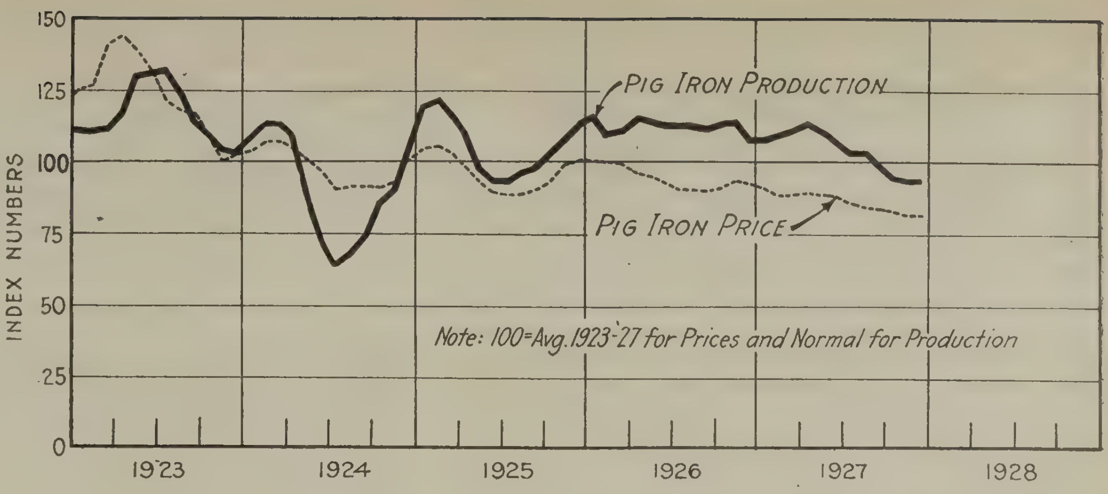


Fig. 2—Smaller Reduction in Output and in Prices of Pig Iron May Indicate an Approaching Upward Turn for Both. No real recovery in the pig iron market is anticipated before steel production advances considerably

such a turn as occurred last month, it seems highly probable that the curve will continue upward.

Unfilled Orders Made Up 1927 Loss

This probability is increased by the sharp rise in unfilled orders. Usually the unfilled orders of the Steel Corporation gain about 4 per cent in December, and such a gain may be called a seasonal occurrence. Actually there was an increase of about 15 per cent last month, and the adjusted index becomes 87.6 per cent of the average for the last five years, in comparison with 79.3 per cent in November and with 87.4 per cent in December, 1926. Unfilled orders have made up all of the loss during 1927. In recent years the adjusted index of unfilled orders has risen in December only twice—in 1924 and in 1925. In both these cases, however, production was above normal and unfilled orders were considerably higher than they now are. Also steel prices were higher and had advanced more in the preceding month or two. It thus seems reasonable to expect that this time a further increase in unfilled orders will occur.

But the fact that the price situation is still in doubt, and that several important products are none too strong marketwise, still leaves a question as to whether there will be any large expansion in forward buying. As yet the activity in the chief consuming industries as a whole has not clearly turned upward.

As to prices, the December average of finished steel prices was 91.5 per cent of the average for the last five years. This compares with 91.1 per cent in November. The advance is small and is not firmly established. Judging both by present conditions and by the performance of the steel market under similar circumstances of the past, the upward trend for a few months is likely to be slight. But the increase in unfilled orders, coming at the same time that production is subnormal, and the fact that steel is cheap in comparison with the general run of commodities, indicate that any changes in the average are likely to be upward.

Pig Iron Continues Below Normal

We present in this issue a revised chart of pig iron production and prices. The normal trend of production has been recomputed and has been based on the average daily production. Of course, the merely seasonal variations have been eliminated. The production curve thus represents the most up-to-date presentation of the true trend of the monthly output of pig iron. The estimated normal monthly output is taken to represent 100 per cent. The price curve is based on The Iron Age composite price of pig iron and the average for the five years 1923-1927 is taken as 100.

The close general parallelism between production and price is at once apparent. Usually a decline in prices *precedes* or accompanies a decrease in production. Usually, too, a rise in price *follows* or accompanies an increase in production. Almost always, when production rises above the normal level, weaker prices result. It will be noted that during 1926 and 1927, when production was continuously above normal, prices were almost continuously sagging.

In December the average daily production of pig iron was around 87,000 gross tons. This was a decrease of over 1000 tons from the November rate, and was 9 per cent below the line of normal growth. Usually

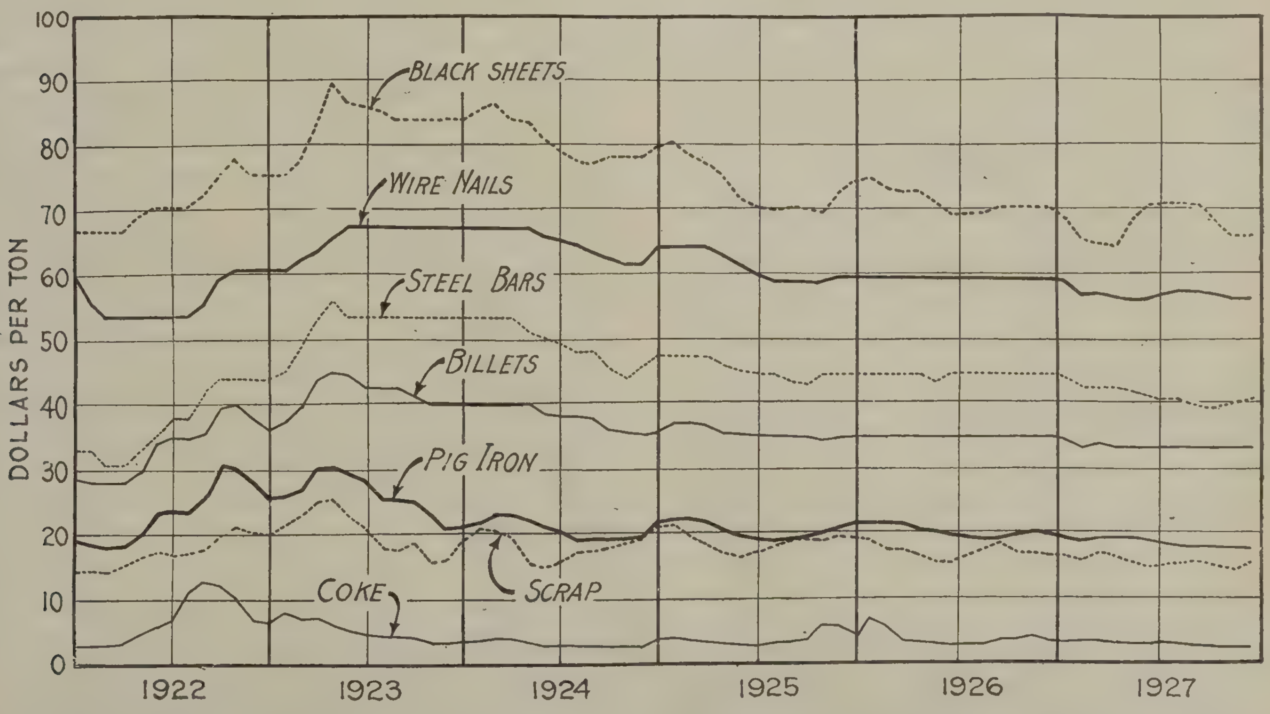

Fig. 3—Finished Steel Prices (in Particular, Sheets, Nails, Plates and Bars) Continue Too Low with Regard to Semi-Finished and Raw Materials. Readjustment of the price structure is not likely to come from further reduction in fuel, pig iron and semi-finished lines

the December average daily pig iron production decreases about 1.6 per cent. As the actual decrease was slightly less than this, the adjusted index shows a fractional gain, being 93.4 per cent of normal against 93.2 per cent the preceding month.

Prices Appear to Have Reached Bottom

THE IRON AGE composite price of pig iron averaged $17.54 in December, which is 6c. lower than the average for November. It is only 82 per cent of the average for the five years 1923-1927. There is, however, good evidence that the decline in pig iron prices has finally been checked. During the last four weeks of December the price remained unchanged, and in the first week of January one of the most notable events in the iron and steel industry was the advance of the average to $17.59.

It is probable that the gradual turn in the production curve, the current rate being considerably below normal, marks a real change in trend, and that further gains will occur. Exactly the same remark applies to pig iron prices.

We think it is to be regretted that the production of pig iron has not been curtailed further, and that it is still a little large in comparison with steel production. The relatively sharp upturn in steel production has, however, reduced the disparity between the two, and another month of expansion in steel, with the pig iron output remaining about steady, would wipe it out entirely. But we can anticipate no real strength in the pig iron market until steel-making requirements do increase relatively to the production of this raw material.

Finished Steel Too Low in Price

MOST notable in the steel price structure continues to be the fact that most kinds of finished steel are too low in price. This is especially true of such products as sheets and nails. Bars and plates, also, are cheap, but the spread over the price of the raw material is not so unsatisfactory as in the more highly finished products.

Coke and pig iron prices seem to be definitely at bottom levels. It is hardly conceivable that they can fall below the recent low points. Billets are but little below their normal price relationship as regards these raw materials, but apparently are well stabilized at existing levels. It seems that we may safely assume that fuel, pig iron and semi-finished steel will not decline further.

But the prices of sheets and nails are also as low as they can be expected to go in comparison with their raw materials. The spread between the two in November and December was about as little as it has been in any recent year. Lower prices for these products seem impossible unless semi-finished steel prices are reduced.

Canadian Steel Company Plans $10,000,000 Expansion; Wants Higher Tariff

TORONTO, ONT., Jan. 17.—The Algoma Steel Corporation, Sault Ste. Marie, Ont., has under consideration a program of plant improvements to cost $10,000,000 to $12,000,000 and has at the same time applied to the Advisory Tariff Board of the Dominion Government for increased tariff protection on three items, alloy steel, spring steel and axle steel for automobiles and structural steel sections above 35 lb. per yd.

J. D. Jones, vice-president of the company, in making this announcement, said:

"We have a definite proposal before the Government that if it will give us adequate protection on these structural sections we shall immediately undertake to extend our facilities and permit our mills to roll sections up to and including 15-in. I-beams and channels, and these facilities will be placed in operation six months after the Government puts its stamp of approval on our appeal.

"This is one of the first and most important steps in the rounding out of manufacturing of the steel commodities which are required by the Dominion, and which involves an expenditure of from $10,000,000 to $12,000,000. This should be very carefully considered on account of the fact that the United States Steel Corporation today has very definite plans for the extension of its facilities at Ojibway, which is adjacent to Windsor, Ont., and that the Steel Corporation contemplates putting in units which will be a duplicate of the units which the Algoma Steel Corporation contemplates installing, but not with the basic pig iron and ingots back of them. This means that the United States Steel Corporation intends to use its blast furnaces and open-hearth furnaces and primary mills of its plants adjacent to the Great Lakes to furnish the raw material for the finishing units that it contemplates installing at Ojibway. This will mean that the adjacent facilities of the mills in the United States, with their large production and low-cost capacity, will be brought into competition with the established basic steel industries of Canada, namely, those at Sault Ste. Marie and Hamilton, Ont., and Sydney, N. S."

The expansion plans of the Algoma Steel Corporation include changes which will make possible the extensive use of the low-grade iron ore to be found in the Algoma district. A power plant development on the Soo River is a part of the building program.

Proposed Youngstown-Inland Merger Still Under Negotiation

YOUNGSTOWN, Jan. 17.—The proposed merger of the Youngstown Sheet & Tube Co. and the Inland Steel Co. is still under negotiation, but according to James A. Campbell, president of the former company, it was nearer a conclusion two weeks ago than it is now. In his latest statement on the matter, Mr. Campbell expresses the opinion that there has been altogether too much publicity about the negotiations and also too much guessing about the probable terms of the transaction. He says that neither he personally nor his company has been buying Inland stock, and he further clarifies the situation by stating that it is not the intention of the Youngstown Sheet & Tube Co. to buy the Inland Steel Co., but simply to bring about a consolidation of the two companies through an exchange of stock, the exchange to be based upon book values rather than the market value of the stock.

Since the two companies are only slightly competitive in products, he believes that a consolidation would be less likely to encounter Governmental opposition than if the two companies were engaged in making virtually the same products. Mr. Campbell also asserts that no other companies are being considered in connection with this merger. It is rather commonly believed in the steel trade here that the Youngstown-Inland consolidation will finally be consummated, it being pointed out that on several occasions in the course of the negotiations obstacles have arisen and have been overcome.

Schedule of the next installments of the ***Business Analysis and Forecast****, by Dr. Lewis H. Haney, Director New York University Bureau of Business Research, follows:* ***Jan. 26****—General Business Outlook;* ***Feb. 16****—Activity in Steel Consuming Industries;* ***Feb. 23****—Position of Iron and Steel Producers.*

Slight Gain in European Markets

Improvement in France, But Export Business Lags—Cartels a Large Factor—More German Unemployment

(*By Cable*)

LONDON, ENGLAND, Jan. 16.

THE pig iron market is quiet, but domestic demand is expected to increase by the end of the current month. Export is still poor generally, although the Continent has bought some hematite. Foreign ore continues dull.

Finished iron and steel demand is poor except for some moderate sales of small rounds and bars. Plate mills are in need of orders, but there is no substantial demand. Rail mills are fairly well occupied.

December exports of pig iron were 38,116 gross tons, of which 3720 tons went to the United States. Total December exports of iron and steel were 351,795 gross tons. Total exports of iron and steel for 1927 were 4,200,000 tons and imports of iron and steel were 4,400,000 tons.

Tin plate is quiet and prices are inclined toward easiness for forward delivery. Some mills are sold out for first half, but others are less favorably situated. Galvanized sheets are moderately active as a result of orders from Bombay, but other markets are small buyers. Black sheets continue quiet.

Continental iron and steel markets are quiet, but prices are fairly well maintained, as works are well booked with orders. The German Wire Rod Cartel has advanced its price 2s. 6d. (61c.) per ton. German domestic prices of iron and steel are advancing. A South African order for German rails is reported to total 65,000 tons of rails and 35,000 tons of steel sleepers, a total value of £500,000.

GERMAN UNEMPLOYMENT GAINS

Market Continues Active—Mills Expect Efficiency to Offset 8-Hr. Day

BERLIN, GERMANY, Jan. 2.—Producers in the Rhineland are of the opinion that the first few months of this year will show a continuation of the heavy domestic demand for steel that has been so marked during the past year. Later, however, a decline in domestic consumption would not be unexpected. Unemployment is increasing rather rapidly. In the first half of December the total of unemployed advanced to about 1,000,000 from 750,000.

As the year closed the steel market was quiet, following the decision to postpone the effective date of the 8-hr. day law and the consequent removal of the threat of suspension by rolling mills. While suspension was still a possibility consumers hastened to build up stocks as a protection. There has been a sharp decline in business in the building trades, and unemployment in the construction unions has increased from 5 per cent to about 25 per cent in the past two months.

Prices of steel products are unchanged. Mills will endeavor to keep costs at the present level, even with the 8-hr. day, by more efficient operation, but in many quarters an early advance in prices is regarded as a possibility. Following the settlement of a disagreement between the Pig Iron Syndicate and the Roechling interests, which was responsible for reductions in prices of foundry iron a few months ago, the market has advanced 4 to 6m. ($1 to $1.50) per ton.

In the International Steel Cartel the Central European group of producing countries, led by Austria and Czechoslovakia, has expressed a desire to withdraw from membership. This group greatly increased its output in 1927, and heavy penalties for overproduction are expected in 1928. Production by the cartel in the second and third quarters of last year totaled 16,344,515 metric tons, while the combined quotas for that period were 14,643,000 metric tons.

Reparations Deliveries Aid German Foreign Trade

HAMBURG, GERMANY, Jan. 3.—Deliveries by German manufacturers on reparations account are evidently proving of considerable aid in developing foreign markets, according to statements by various companies. These deliveries, which have been made for the most

British and Continental European prices per gross ton, except where otherwise stated, f.o.b. makers' works, with American equivalent figured at $4.87 per £ as follows:

Durham coke, del'd.	£0 17½s.		$4.27	
Bilbao Rubio ore*	1 0½		4.99	
Cleveland No. 1 fdy.	3 7½		16.44

Belgium	6 1		1.34	
Germany	6 1		1.34	

(a) Nominal.

part to Rumania, Jugoslavia, Greece, Italy, France and Belgium, have provided a good method of advertising German products. As an example, it is pointed out that German typewriters were practically unknown in Italy until a large reparations order was executed. Now Italy is purchasing about one-third of its total imports in Germany.

American typewriters are largely used in Jugoslavia, but recently an order was placed for 2100 German machines to be applied to reparations account. It is said that German locomotives have been introduced into South Africa, Egypt and other countries which have bought elsewhere in the past. German manufacturers of equipment of all kinds are being invited to seek reparations orders, as they generally lead to future purchases that compensate for the initial losses incurred because of delivery on reparations.

GERMAN CARTEL FINE HIGH

Report Shows German Penalty for Over-Production Still $4 a Ton—France Receives Refund

HAMBURG, GERMANY, Jan. 3.—The report of the International Steel Cartel for the second and third quarters of 1927 has been published. Although Germany was promised a reduction of fines for over-production to $1 per ton, provided exports did not exceed 28 per cent of the total German output, the balance sheet of the cartel shows the former fine of $4 per ton.

Over-production figures in this report are: Germany, 1,061,252 metric tons; Belgium, 159,180 metric tons; Luxemburg, 35,749 metric tons, and the Saar, 101,369 metric tons. France was again under its quota by 438,029 tons. The following comparison is based on a payment of $1 for every ton of steel produced, $4 per ton for excess production, and 2 per ton refund for underproduction:

Cartel Member	Production Payments	Fines for Excess	Distribution
Germany	$8,165,246	$4,245,008	$9,023,204
France	4,128,471	........*	6,516,410
Belgium	1,851,680	646,720	2,415,885
Luxemburg	1,251,249	142,996	1,734,797
Saar	947,869	405,476	1,208,361

---

*France received a refund for production under the quota of $876,058.

The net loss to Germany, after receiving the funds distributed to members, is equivalent to 1.74m. (43c.) for each ton of steel produced; the loss to Belgium, 0.16m. (4c.) per ton; to the Saar, 0.65m. (16c.) per ton, and to Luxemburg, 1.14m. (28c.) per ton. France received refunds equivalent to 1.32m. (33c.) per ton of steel produced.

Germany Making Agreements to Exchange Coal for Ore

HAMBURG, GERMANY, Jan. 3.—The agreement between the United Steel Works Corporation and the Austrian Alpine Montangesellschaft, under which there is an exchange of German coke and coal for about 60,000 tons of Austrian iron ore a month, is to be further extended. Negotiations have also been started with Sweden for a similar agreement, under which a fixed tonnage of iron ore would be exchanged for coke and coal. Such agreements are also being discussed with French producers.

Germany Divides Turkish Tube Order with France

HAMBURG, GERMANY, Jan. 3.—The German Tube Syndicate has booked an order from the Turkish Government for 12,000 tons of tubes. As a result of an agreement with French mills, the latter will receive 4000 tons of the total order. British competition for this business was keen, and the difference between the British and German bids is reported to have been small.

FRENCH BUSINESS IMPROVES

Export Trade Still Quiet—Reestablishment of Comptoirs May Permit International Agreement

PARIS, FRANCE, Jan. 3.—The business outlook for the next few months is viewed with considerable optimism by most producers of iron and steel. Stocks of consumers have been reduced to a rather low level, and prior to the holidays some important purchasing was being done, which is expected to continue during the first quarter. The financial condition of the country is better, and legal stabilization of the franc is expected before many months. Prices are consequently firmer than for some time.

Foreign trade continues in moderate volume, but prices are showing a slight downward tendency on some products. The export market in rails has been favorably influenced by the recent sales of the European Rail Makers' Association, which has booked about 75,000 tons for Argentina and 60,000 tons for South Africa.

Since the failure of negotiations for the formation of international selling syndicates for semi-finished material and beams, because of lack of organization among French mills, efforts have been made to revive the national agreements on heavy rolled products which existed in 1921. These negotiations have been successful and, according to reports, these reorganized associations will be functioning soon. This is considered a step favorable to the organization of the international syndicates.

Pig Iron.—Domestic business has been good, and the base price of phosphoric foundry iron advanced 5 fr. per ton to 425 fr. on Jan. 1. No change in prices of hematite iron is expected. Exports of pig iron have gained, and foundry iron is firmer at £3 2s. 6d. ($15.22) per ton, f.o.b. Antwerp.

Semi-Finished Material.—Buying has been light, and export prices are nominal. The domestic market is also quiet, with prices showing some softness.

Finished Material.—Buying has been heavier than usual at this season, possibly as a result of the reports that prospects for the formation of selling syndicates are better. Believing that, with such syndicates in existence, minimum base prices might be established at once, buyers are willing to enter into contracts at the present level. Beams are slightly firmer for export at £4 7s. to £4 9s. per ton (0.96c. to 0.97c. per lb.), f.o.b. Antwerp, and small lots are reported to have been closed at as high as £4 10s. per metric ton (0.98c. per lb.). Steel bars are steady and unchanged at £4 17s. to £4 17s. 6d. per ton (1.07c. to 1.08c. per lb.), f.o.b. Antwerp. The light sheet market is improving domestically, but export sheet business is still small.

German Enforcement of 8-Hr. Day Faces Many Obstacles

WASHINGTON, Jan. 17.—While the arbitration decision announced by the German Ministry of Labor in an effort to enforce the 8-hr. working day has not as yet been formally accepted by either steel makers or the workers, there is a general impression that both parties will accept, according to a radiogram received by the Department of Commerce from the commercial attaché at Berlin. It is expected, however, that the period of tension will continue over several weeks.

Meanwhile there has been some localized trouble, notably at the Groebitz plant of the Mitteldeutsche Stahlwerke, in which the workers deserted the mills at the end of an 8-hr. shift. Operators thereupon announced that the plant was to be closed down and along with it the Riesa plant. Under the terms of the arbitration the Sunday holiday in the steel industry is limited to 12 hr. On the other hand, the overtime premium is set at 25 per cent, or double the previous rates. The decision also provided for a general increase of 2 per cent in the wage scale and included provision for compensation for the time lost during 1927 in effecting the shortening of working hours. The most important phase of the situation at this time, the radiogram says, is operating costs.

CARTELS A TRADE FACTOR

This Form of European Competition Needs Careful Watching, Says Dr. Klein

WASHINGTON, Jan. 17.—The extensive character and ramifications of European steel cartels, described as formidable weapons designed to meet the competition of the American steel industry, were explained by Dr. Julius Klein, director of the Bureau of Foreign Commerce, Department of Commerce, when he appeared before a House subcommittee of the Committee of Appropriations. These cartels, said Dr. Klein, were intended to offset the American industry not simply as to uniformity of sales policies, market quotas and prices, but also "with an agreement as to vital factors of more economical production through interchangeability of technical personnel, patent rights, and related matters."

Dr. Klein appeared before the subcommittee to seek appropriations for the bureau for the fiscal year 1929. While the subcommittee in its report made adverse recommendation regarding Dr. Klein's proposal for an increase in the number of commodity trade commissioners, it recommended an increase in appropriation over that proposed by the Bureau of the Budget.

Dr. Klein emphasized the growing European competition and urged the necessity of increasing the specialized staff of the bureau to meet the situation as it exists and as it promises to develop, pointing out that it is becoming greater in intensity. He listed numerous commodities which are "cartelized" in Europe and are conspicuous in the American field of export. He said that steel, of course, is one of the biggest items of American export trade.

So far as the work of the bureau in general is concerned, Dr. Klein said, there are two or three developments which will require "very careful attention."

Stiffening of European Competition

"The first," he declared, "is the unmistakable evidence of a stiffening of European competition, notably in the development of cartels or combinations, of which there are press announcements almost every week. This is one of the outstanding trade factors that we must watch this next year, and I earnestly hope the committee will give it most careful consideration.

"I found, for example, on the Pacific Coast the greatest alarm regarding the steel situation because of the competitive difficulties. Recently there has been a very marked increase in European exports of steel to the Pacific Coast by way of the Panama Canal. The importation of German and Belgian steel has jumped in some cases nearly 100 per cent in the last 12 months to certain points on the coast; and this development is typical, I think, of what we may expect in certain lines of industries affected by these cartels or these international trusts."

Greatest Alarm Over International Cartel

"Not until the cartel became international was it a source of serious alarm to us," said Dr. Klein. "Now what is happening? Europe is much concerned because of this enormous advantage that we have with our great domestic market and this vast possibility for mass production, and consequently it is striving rather blindly toward comparable advantages. That is to say, they want to bring all of the European factories together. In other words, it has now become an international issue over there."

Declaring that most of the continental countries, Germany, Belgium, France, Luxemburg and Czechoslovakia, have joined the steel cartel, Dr. Klein said that England has not yet formally joined the group but there are constant intimations that she will. Other cartels, about 12 of them, have since been organized, Dr. Klein said, among organizations controlling raw steel, rails, tubes, wire, aluminum, copper and enamel ware.

"I do not think it is a thing over which we need be too seriously alarmed; that is to say, it is nothing to justify a panicky reaction," Dr. Klein declared. "As yet, I think the situation can be met by the great advantages that we have in this country; but it is certainly a situation that we will have to watch very closely, and this is my purpose in bringing it up at this time. We have simply got to be informed on the subject immediately, so as to know what is going on within these specialized industries."

Europeans in Drive for Foreign Markets

Another phase of competitive effort that required attention, Dr. Klein said, regards individual governments in Europe which are preparing, "with a seriousness and intensity never manifested until this year for a new drive for foreign markets." Reference was made to different movements in this direction, among them the setting up by the British of the Imperial Marketing Board which is to receive $5,000,000 annually for 10 years for the purpose of developing trade between different parts of the British Empire.

"The British Empire is easily our largest customer," Dr. Klein stated. "If my memory serves me, we sell not less than 44 per cent of our total exports to units of the British Empire, and any move like that is a matter of very considerable interest to us. Incidentally, this $5,000,000 fund is a good deal more than the appropriation of the whole Bureau of Foreign and Domestic Commerce."

He said the commercial rapprochment that is being stimulated among the different units in the British Empire is something to which no exception could be taken. On the contrary, he said, if it helps the prosperity "of our best customer it will obviously help us." Yet he said the situation should be watched carefully. Dr. Klein also dealt with discriminations against American products through tariffs and regulations of different countries. Among other things he said that although the British are very active in Australia and India, where they have advantage in the way of lower tariffs, the United States' share of Australian imports rose from 11 per cent of her total imports just before the war to 22 per cent today.

EXPORT BUSINESS SMALL

Small Lots of Tin Plate Sold to Far East—Japan Inquires for Oil Well Supplies

NEW YORK, Jan. 17.—Export business continues small. There has been some small-lot buying by Cuban consumers, and Japanese merchants have recently been asking for prices on light-gage black sheets and tin plate. A current inquiry from Japan covers a wide range of oil well supplies, including 475 tons of seamless oil well casing and 46,000 ft. of ⅜ to 3-in. gas pipe for the Northern Karafuto Oil Co. The South Manchuria Railway Co. has awarded 100 miles of 100-lb. rails to European mills, but placed about 157 tons of anti-creepers in the United States. The Chosen railroad, recently in the market for rails and accessories, has placed 1676 tons of tie plates and about 46 tons of guard rails with American mills. A small lot of 82-lb. high T-rails for the same railroad is reported to have gone to a Continental mill.

Both Japanese and Chinese merchants have been fairly active purchasers of small lots of tin plate at prices ranging from $5.25 to $5.35 per base box, c.i.f. Japanese or Chinese port. While there has been some inquiry from Japan for light-gage black sheets, the market here is about $77 per ton, c.i.f. Japan, and the British quotation is still $73 to $74 per ton, c.i.f.

New York importers of European steel have been booking only small orders lately. Continental prices are still from 1.68c. to 1.73c. per lb. for Thomas steel bars and 1.58c. to 1.63c. per lb., duty paid, for shapes. There is some small business being done in low-carbon wire rods and hot-rolled hoops.

A bibliography of factory cost accounting and production engineering, compiled by Paul M. Atkins, consulting industrial engineer, Chicago, has been published by the Society of Industrial Engineers, 608 South Dearborn Street, Chicago. Of the 90 pages (6 x 9 in.), 13 are devoted to a general bibliography, 42 to production engineering and 35 to cost accounting. Each of the last two sections of the bibliography is subdivided topically.

British Iron and Steel Output Small in December—Totals for 1927

LONDON, ENGLAND, Jan. 14 (*By Cable*).—December production of both pig iron and steel declined sharply from previous months. Pig iron at 559,100 gross tons was the smallest for the year except January. At 604,900 tons the lowest steel production for any month of 1927 was recorded.

The 1927 pig iron total was 7,293,500 tons and that of steel was 9,099,000 tons. How these compare with previous years is shown in the following table in gross tons:

	Pig Iron Tons	Steel Ingots and Castings Tons
1913—Average monthly.......	855,000	638,600
1920—Average monthly.......	669,500	755,600
1922—Average monthly.......	408,500	490,100
1923—Average monthly.......	620,000	706,800
1924—Average monthly.......	609,900	685,100
1925—Average monthly.......	519,700	616,400
1926—Average monthly.......	203,500	296,700
1927—Average monthly.......	607,800	758,200

Unfilled Orders of Independent Sheet Mills Largest in Eight Years

The formal report of the National Association of Sheet and Tin Plate Manufacturers confirms earlier information that the end of 1927 would see unfilled orders of approximately 750,000 tons. The actual figure as disclosed in the monthly report is 745,393 tons, equal to more than two months' full operation and the largest tonnage the companies reporting have had on their books at one time in almost eight years. Sales in December gained heavily, reaching an aggregate of 530,197 tons, almost 200,000 tons more than in November and almost 300,000 tons more than in October. The excess of sales over shipments in December was approximately the same as the increase in unfilled orders, sales running 308,508 tons over shipments, while the increase in the unfilled orders was 308,087 tons. Never before since the association has been issuing reports has there been such a close relation between the difference between sales and shipments and the change in unfilled orders. The December figures with comparisons follow:

	December	November	October
No. of mills	719	718	719
Capacity per month.....	472,064	485,350	472,500
Per cent reporting......	72.6	72.6	72.6
Sales	530,197	344,519	234,358
Production	260,130	232,041	245,765
Shipments	221,689	224,789	232,626
Unfilled orders..........	745,393	437,306	308,264
Unshipped orders.......	97,630	92,678	95,462
Unsold stocks..........	52,474	52,996	50,518
Percentages to Capacity			
Sales	154.7	97.8	68.4
Production	75.9	65.9	71.7
Shipments	64.7	63.8	67.9
Unfilled orders..........	217.5	124.2	89.9
Unshipped orders.......	28.5	26.3	27.9
Unsold stocks..........	15.3	15.0	14.7

Government Publishes New Book on Trade Associations

WASHINGTON, Jan. 17.—The Bureau of Foreign and Domestic Commerce has issued the second edition of "Trade Association Activities," prepared by Irving S. Paull, J. W. Millard and James S. Taylor. Indicative of the growing cooperation between the Government and business, this compilation was brought about through the efforts of more than 500 officers of trade associations and 50 officials representing 17 Federal departments. There were others also, including those in the legal and other professions. The subject of trade association activity is treated comprehensively in the book's 365 pages. Trade associations throughout the country, their activities, accomplishments, etc., are listed.

In a foreword, Secretary of Commerce Hoover says that the purpose of the new and previous publications is to indicate the successful service of trade associations in public interest.

Bituminous coal mined in the first week of January is reported by the United States Bureau of Mines at 9,803,000 net tons. This is about in accordance with recent weeks, but is 10 per cent below the figures of a year earlier.

Bill to Authorize Educational Orders for War Department Needs

WASHINGTON, Jan. 17.—The shortage in the War Department's reserves of munitions, equipment and raw material which recently was reported to President Coolidge by Secretary Davis has prompted a bill just submitted to Congress by the department. The measure would authorize the Secretary of War to place educational orders for equipment, munitions and accessories with industries of the country to familiarize them with their production and to advance the industrial mobilization program of the War Department. The bill would provide for the placing of these orders with industrial companies regardless of the general requirement that the lowest bid be accepted. The Secretary of War pointed out that the new type of artillery guns and carriages can be manufactured more cheaply by the Government than by private industry, but contended that part of those needed should be made by private companies so that they might acquire knowledge of the methods and requirements and thus be prepared for mass production in the event of an emergency. Secretary Davis also pointed out that rifle ammunition of the present type differs considerably from that used in the World War and yet no private producers have manufactured it.

Battelle Memorial Institute for Industrial Research

Announcement has been made of the organization of the Battelle Memorial Institute at Columbus, Ohio, which has been formed to perpetuate a trust arising from the wills of Col. John Gordon Battelle, his wife and his son, Gordon Battelle.

Colonel Battelle was active in the iron and steel and coal industries, and his son, whose death in 1923 made the estate available, was also an active figure in the iron and steel trade in the Middle West, being a director of the American Rolling Mill Co., and the Inland Steel Co., and other companies.

Under the terms of the will the institute is to be located in Columbus. A tract of about five acres, opposite the campus of the Ohio State University, has been secured and the construction of the first two buildings, to cost about $500,000, will be undertaken in the spring. Dr. Gerald Wendt, dean of the school of chemistry and physics, Pennsylvania State College, has been selected as director and it is planned to begin operations at the institute by the fall of 1928. Otto C. Darst, Columbus, has been designated as the architect.

The first building will stand as a memorial to the Battelle family, and will comprise administrative offices, auditorium, library, museum, machine shop, stock rooms and a number of laboratory suites. The second building, to adjoin the first, will have individual laboratories and an engineering shop, the latter to be provided with balconies and an electric overhead crane.

It is stated that although the main object of the Battelle institute will be industrial research under the fellowship system, similar to that at the Mellon Institute, the income from the funds of the institute itself will be devoted to long-distance industrial research for the benefit of American industry and for scientific research. The board of trustees includes Joseph H. Frantz, Earl C. Derby, Harry M. Runkle and Gerald B. Fenton, all of Columbus. Bishop J. W. Hamilton, formerly president of the American University, Washington, and J. Clare Miller, Ashland, Ky., are also trustees.

1927 Car Loadings 2.6 Per Cent Under 1926

Complete reports of the car service division of the American Railway Association show that 51,714,302 cars were loaded with revenue freight in 1927. This was a decrease of 2.6 per cent from 1926, but an increase of 0.9 per cent over 1925. For the week ended on Dec. 31, 1927, loadings amounted to 679,600 cars, a decrease of 149,406 cars from the preceding week and 54,681 cars from the corresponding week of 1926.

Large Gear Interests Merge as Gears & Forgings, Inc.

Ohio Forge Co. Also Included in Consolidation of Van Dorn & Dutton Co., Fawcus Machine Co. and William Ganschow Co.

FORMATION of Gears & Forgings, Inc., as a consolidation of the Van Dorn & Dutton Co., Cleveland; the Fawcus Machine Co., Pittsburgh; the William Ganschow Co., Chicago, and the Ohio Forge Co., Cleveland, has been announced. Preliminary plans for this merger were mentioned in THE IRON AGE of Jan. 5. Inclusion of the Ohio Forge Co. in the new organization enables it to control the manufacture of industrial gears from the raw materials to the finished products, and, as one of the country's largest manufacturers of gears, the new company will be able to realize the advantages of large scale production and geographical location.

The Constituent Companies

The Van Dorn & Dutton Co., founded in 1897, has a plant at Cleveland, and manufactures industrial gears of all types. The company has been particularly active as a maker of gears for machine tools, and has specialized in analyses of machine tool power transmission problems.

The Ganschow company, organized some 50 years ago, was one of the first gear manufacturing companies in Chicago. Beginning as a maker of general industrial gears, it has extended its products to include spur gear and worm gear speed transformers and cut gears of all types and materials. The company has plants at Chicago and Peoria, Ill.

The Fawcus Machine Co. is a maker of large industrial gears, herringbone gears and special machinery. With plants at Pittsburgh and Ford City, Pa., the company now produces, in addition to a wide line of gears, special steel mill equipment, including mills, strip coilers, gear transmissions of from 100 to 15,000 hp., tandem sheet mill drives, and machinery for mechanically operated bridges. It also engages in engineering of heavy mechanical devices for various purposes. It was organized in 1901.

In 25 years the Ohio Forge Co. has expanded from a one-hammer shop to a seven-unit plant equipped with modern forging machinery. Its location adjoins the plant of the Van Dorn company at Cleveland, affording direct control of material in the new organization.

Personnel of New Company

F. W. Sinram, chosen president of Gears & Forgings, Inc., has been president and general manager of the Van Dorn & Dutton Co. for a number of years and has been largely responsible for its expansion and growth. One of the organizers of the American Gear Manufacturers' Association, he was its first president and held that office from 1917 until 1923, when he was elected honorary president for life. He has been active in the work of standardization of gear design, and was prominent in Secretary Hoover's gear standardization program. Mr. Sinram's headquarters will be at the company's general offices on Woodhill Road, Cleveland.

A. F. Cooke, formerly vice-president and general manager of the Fawcus company, who will be first vice-president of the new corporation and manager of the Fawcus Division, has also been active in the American Gear Manufacturers' Association, particularly as chairman of its herringbone committee. As the former president of the William Ganschow Co., William Ganschow, second vice-president of the new company and manager of its Ganschow Division, has spent the greater part of his life in the gear-making business. He served on the first gear standardization committee of the association. J. M. Clem, third vice-president, founder and general manager of the Ohio Forge Co., will serve as manager of the consolidation's Ohio Forge Division. His interest has been largely with the operating divisions of the Ohio Forge Co., while S. C. Dalbey, who has been active in the commercial development of the forge company, will be secretary and treasurer of Gears & Forgings, Inc.

T. E. Leighton, formerly secretary of Van Dorn & Dutton, will be assistant secretary and treasurer of the new company, and C. F. Goedke, recently secretary of the Ganschow organization, will be district sales manager with headquarters in Chicago. The officers, together with H. B. Newell, for many years assistant to Mr. Cooke in the Fawcus company, will constitute the directorate of the new company. Mr. Newell will also be chief engineer.

Compressed Gas Manufacturers to Hold Annual Meeting

The fifteenth annual meeting and dinner of the Compressed Gas Manufacturers' Association will be held at the Hotel Astor, New York, Monday, Jan. 23.

Following an address of welcome by the president, John C. Minor, at 10.30 a. m., three papers are to be presented as follows: "Improving the Physical Properties of Steel by Testing Beyond the Elastic Limit," by Dr. F. C. Langenberg, metallurgist Watertown Arsenal and vice-president Climax Molybdenum Co., New York; "Corrosion," by C. E. MacQuigg, manager Union Carbide & Carbon Research Laboratories, Long Island City, N. Y., and a liquid oxygen demonstration, by G. E. Harcke, Air Reduction Co., New York.

An afternoon session will be devoted to such topics as dry ice and the fire hazards of methyl chloride as a refrigerant, together with an address by Merritt Lum of the McGraw-Hill Publishing Co. on "Sound Industrial Marketing." A business session will follow the afternoon technical session.

The annual dinner is scheduled for 7 p. m. in the north ballroom at the Hotel Astor.

COPPER INDUSTRY IN 1927

Total Stocks Fell Off—Exports Increased but Imports Declined—Domestic Consumption Low

OUTSTANDING features of the copper industry in 1927, according to the United States Bureau of Mines, were a relatively maintained production, a decrease in imports of refined copper, an increase in exports of metallic copper, a decrease in total stocks and a falling off in domestic withdrawals.

Stocks of refined copper available for consumption were 22,000,000 lb. larger at the beginning of 1927 than at the beginning of 1926. The small drop in refined copper output and the decrease in imports of refined copper made less copper available for consumption and, together with the increase in refined copper exported, entirely offset the decrease in domestic withdrawals. Therefore, the increase in stocks of refined copper in 1927 was relatively the same as in 1926, approximately 22,000,000 lb.

The smelter production of copper from domestic ores in 1927, as determined by the Bureau of Mines from reports of the smelters showing actual production for 11 months and estimated production for December, was 1,696,000,000 lb., compared with 1,740,000,000 lb. in 1926. The 1927 production is 2.5 per cent less than that of 1926, but, with the exception of 1926, is the largest peace-time production on record. The estimated smelter production from domestic ores for December, as reported by the smelters, was 145,000,000 lb., which is 4,000,000 lb. higher than the average for the 11 months preceding.

The production of new refined copper from domestic sources, determined in the same manner as smelter production, was about 1,739,000,000 lb., compared with 1,731,000,000 lb. in 1926. In 1927 the production of new refined copper from domestic and foreign sources amounted to about 2,318,000,000 lb., compared with 2,322,485,000 lb. in 1926, a decrease of nearly 4,500,000 lb., or 0.2 per cent. The production of secondary copper by primary refineries decreased from 225,118,000 lb. to about 216,000,000 lb. in 1927, or 9,000,000 lb., so that the total primary and secondary output of copper by the refineries was a little over 0.5 per cent lower in 1927 than in 1926, being about 2,534,000,000 lb., compared with 2,547,603,000 lb.

Imports and Exports

The imports of manufactured copper during the first 11 months of 1927, according to the Bureau of Foreign and Domestic Commerce, amounted to 660,326,768 lb., a monthly rate of 60,000,000 lb., compared with 779,441,803 lb. for the entire year 1926, a monthly rate of 65,000,000 lb. The total imports for 1927 will very likely show a decrease in quantity approximating the monthly average for the year.

The exports of metallic copper during the first 11 months of 1927 amounted to 965,434,212 lb., compared with 960,220,112 lb. exported during the entire year 1926. If the exports of metallic copper in December equaled the monthly average for the first 11 months of the year, nearly 88,000,000 lb., the total for 1927 was about 1,053,000,000 lb., an increase of about 10 per cent over the exports in 1926.

Refineries report that at the end of 1927 approximately 168,000,000 lb. of refined copper would be in stock, an increase from 146,000,000 lb. at the end of 1926. It is estimated that stocks of blister copper at the smelters, in transit to refineries, and at refineries, and materials in process of refining, would be about 380,000,000 lb. on Dec. 31, compared with 455,000,000 lb. at the end of 1926, a decrease of 75,000,000 lb. Therefore, a decrease of 53,000,000 lb. in total smelter and refinery stocks is indicated.

The quantity of new refined copper withdrawn on domestic account during the year was about 1,442,000,000 lb., compared with 1,570,000,000 lb. in 1926, a decrease of 128,000,000 lb., or approximately 8 per cent. However, domestic withdrawals in 1927, with the exception of those in 1926, were larger than those of any other peace-time year.

Fewer Mechanical Stokers Sold in 1927

WASHINGTON, Jan. 16.—Mechanical stokers to the number of 83, with 32,202 hp., were sold in December, according to reports received by the Department of Commerce from 12 establishments, compared with 67 stokers and 16,955 hp., sold in November. The December rating was the highest since August. Of the number sold in December, 29 with 4799 hp., were installed under firetube boilers and 54 with 27,403 hp., under watertube boilers. For the calendar year, 1261 mechanical stokers, with 462,918 hp., were sold, comparing with 1361 with 546,228 hp., sold in 1926.

1927 Construction Costs Slightly Above Previous Year

Construction costs rose slightly during 1927, according to statistics compiled by the Associated General Contractors of America, Washington. The average of these costs at the conclusion of the year was exactly twice as high as the corresponding figure for 1913 and was identical with that of 1921.

Sharp Drop in Locomotive Sales Last Year

Shipments of railroad locomotives are reported by the United States Department of Commerce to have aggregated 1074 units in 1927. This is a reduction from 1926 of 39 per cent, the figure in that year having been 1755. The decline covered all the groups, except steam locomotives for export, which increased from 167 to 171. The sharpest drop was in electric locomotives for export, which fell off one-half, from 59 to 29. Steam locomotives for domestic roads dropped 46 per cent from 1352 to 726, while electric locomotives for American use declined 16 per cent from 177 to 148. Orders on hand at the end of the year were 232, compared with 398 a year earlier and with 780 at the end of March, 1926.

Wholesale Prices Almost Stationary

December averages of commodity prices, as reported by the United States Bureau of Labor Statistics, show 96.8, compared with 96.7 in November, both being referred to the average of 1926 as 100. Both months were lower than in December, 1926, when 97.9 was recorded.

Metals and metal products showed a considerable advance, from 97 in November to 98.4 in December. This was due almost entirely to non-ferrous metals and to automobiles, both of which are shown to have advanced two points or more. Except for an advance of 2.6 points in hides and leather products, all the other main groups of commodities showed only fractional changes, mostly downward. Building materials advanced slightly, while fuels showed a small decline.

Further Reduction in Trackwork

Shipments of trackwork for heavy rails in 1927 were the smallest for several years, according to a report of the American Iron and Steel Institute. The total is given as 140,950 net tons, compared with 178,588 tons in 1926 and 171,394 tons in 1925. A total of 211,662 tons was shipped in 1923. Monthly shipments fell off during the last four months of 1927 to successively lower figures each month than had been recorded within the three-year period. December, with 8263 tons, was the lowest of all.

Class I railroads on Dec. 31 had 464,005 surplus freight cars in good repair and immediately available for service, the Car Service Division of the American Railway Association has announced. This was an increase of 57,311 cars, compared with Dec. 24, when there were 406,694 cars.

Better Marketing Is Steel Need

Consideration Given by Sales Executives to "Profitless" Selling —One Sees Mergers As a Step Toward Stabilization

IN THE IRON AGE *of Jan. 5 appeared a number of contributions from steel selling executives commenting on the difficulties encountered in the marketing of steel at profitable prices. Two other letters on this subject are presented below in which the hope is expressed that mergers in the industry will work toward economic stabilization, and that cooperation along proper lines among steel producers will also prove to be an important factor in educating both sellers and buyers that stable and profitable prices for steel will help to create more prosperous conditions for both. The letters follow:*

Sees Mergers as an Aid to Steel Price Stabilization

"The profitless prices existing in the steel industry today in most cases have been established by some producers who are striving desperately to stay in the running and hoping for a more profitable period in order to recoup their losses, or put up an appearance of capacity operation and seeming prosperity in order to negotiate an advantageous merger with some other company.

"It is to be noticed that this same condition exists not only in the steel industry, but in practically all lines of endeavor—particularly, we refer to the coal industry. The present low prices in the coal industry are dictated by the small and inefficient producer, and the only solution to this problem in the steel, or any other industry, is the consolidation or merging of many of the small producers under one head and to have these merged companies operated economically.

"It is within the ability of all of the steel companies to stabilize steel prices at a profitable level if they will simply recognize the published prices and refuse to accept a buyers' market. This, however, can only be done when the smaller units have been consolidated into larger units and the management of the various large units recognizes that it is futile and hopeless to try to make a profit in the steel business as long as selling prices are lower than the cost of production.

"Present indications show a trend toward steel producers' merging with manufacturers of various types of articles using the steel produced from the integral unit. The main reason for this is to overcome the tendency of buyers to dictate the price they are willing to pay for their raw material; and if present buyers persist in this effort, they will, in a few years, find the steel companies in competition with them rather than a source of supply for them.

"The cutting of steel prices does not create a particle of extra business for the steel industry as a whole, and the greatest amount of buying is never done on a declining market. It is only after the turning point of prices that many of the buyers come into the market in order to secure the best prices they can before there is an increase of any size; and it is generally shortly after this turning point that the industry as a whole enjoys the greatest prosperity, measured in the highest percentage of operation. This increase in operation is generally reflected throughout the country in various other industries by better employment and larger sales of finished material or equipment of various kinds.

"Therefore, if the buyers of steel products in the United States could be educated to the point of being willing to pay at all times a profitable and stable price for steel commodities, the average prosperity of the country would be greater at all times than under existing conditions. This would permit a better general average of employment throughout the country and would tend to increase the faith of the buying public in the future, purchasing not only for immediate needs, but for future requirements.

"It is to be hoped that under the leadership of Charles M. Schwab, the new president of the American Iron and Steel Institute, who is a great advocate of cooperation, the institute will appoint a committee to work out some plan whereby this general scheme of education for stabilizing operating conditions and prices may exist without violating any of the laws of our country."

Says Demand for Capacity Operations Brings Profitless Selling

"It is our opinion that it is not the selling of steel that is wrong so much as the manufacture, and by that I mean that most sales managers are influenced by the attitude of operating officials who insist that they must run to capacity in order to obtain low costs. Obviously this policy followed by all steel producers results in a scramble for the available business and generally drives prices to a point where no profit exists and where all manufacturers are generally on the same footing so far as operations are concerned. I believe it is the feeling of most men handling sales problems in steel that much more intelligent policies could be formulated and followed if the operating demand for capacity operations could be removed.

"The present form of steel contract of course is not a contract at all. It surely has a pernicious effect on the market, as shrewd buyers, when they sense a price advance coming, will cover for their estimated requirements with as many producers as are foolish enough to offer them options, so that advances in price do not affect them, at least for three to six months after higher prices are established.

"No doubt if all forms of rolled steel could be sold in the same manner as pig iron, copper and zinc, much more stable markets would result.

"Concessions granted to large buyers undoubtedly have an undermining influence on price structures and in our opinion should be entirely eliminated.

"The pipe situation is better than most lines in steel, for the simple reason that there are comparatively few producers and those who are in the industry apparently have rare judgment in the handling of their business."

Institute of Metals to Discuss Secondary Metals

Secondary metals will be the topic of a symposium headed by E. R. Darby, Bunting Brass & Bronze Co., Toledo, Ohio, at the annual meeting of the Institute of Metals Division, American Institute of Mining and Metallurgical Engineers, New York, Feb. 20 to 23. H. M. St. John will describe the practices and problems of reclaiming such secondary metals as are used at the plant of the Detroit Lubricator Co.; Don C. Blackmar will consider the economic side of plant handling of waste materials; C. O. Thieme will discuss the contamination of metal scrap, the effect on the value, and suggested means of control, while T. A. Wright will discuss the sampling and evaluation of secondary non-ferrous metals. J. P. Dunlop, of the United States Bureau of Mines, will present statistics on the amount of secondary non-ferrous metals now recovered in this country, showing what a large proportion of the metal used is derived from secondary sources.

Since the reliable information available on these topics is very meager it is expected that the attendance at these sessions will be large and that all present will participate in the discussions so as to increase the general fund of knowledge. The institute urges that all interested in the secondary metal business, whether members of the institute or not, attend these sessions, as the members will be glad to have their cooperation.

This Issue in Brief

Doubles output of moderate-sized plant by relatively simple, quickly-made changes. Overhead monorail system hung from wooden roof trusses, regrouping of machinery, and institution of four-shift working day enable foundry to modernize without rebuilding. Change from old to new basis was made in two days.—Page 187.

Steel prices are likely to move upward, Dr. Haney indicates. His forecast is based on the fact that unfilled orders have increased sharply, output is subnormal, and steel is cheap in comparison with average price of other commodities.—Page 206.

Over-extension of sales effort is blamed for low profit level. There is enough prosperity to go around, says machinery builder, but metal workers have intensified an already highly competitive situation by unwise extension of sales efforts.—Page 220.

Rockwell hardness test provides a simple means of preventing the mixing of mild carbon seamless tubing with alloy steel tubing for aircraft use. In normalized state, chrome-molybdenum tubing shows a hardness of not less than 90B, while mild steel is below 80B.—Page 202.

"Fairly prosperous" year is expected by majority of members of National Metal Trades Association. More than half the members replying to questionnaire believe business will be "good" in 1928; 7.25 per cent expect "extra good" business, and 34.75 per cent say "fair."—Page 200.

Severe shock caused by guns being fired dead ahead fails to injure sheet steel used in battleships. Steel, non-splintering and enduring, displaces wood and canvas for partitions, desks, bunks, wind sheds, etc., on war vessels.—Page 199.

Sintering will reduce pig iron-making costs, says engineer. All flue dust can be sintered, he declares, at a fraction of the unit cost of equivalent ore, and that the use of 100 per cent sinter in the blast furnace will effect economies not believed possible heretofore.—Page 191.

"Comparative cost" card warns production head when cost of any manufactured part runs above normal. The card shows comparative costs over a period of years, and moves him to investigate before or while the next lot is in production.—Page 196.

Foundry of moderate size finds economical way to dispose of slag. Instead of emptying it into a hole in the floor, a cast iron dump bucket is spotted under the weep hole of the cupola. When the bucket is full, it is pulled to the dump yard, on a monorail conveyor, and emptied after cooling.—Page 190.

Watch European cartels, warns Dr. Klein, asking Congress for larger appropriation for foreign trade work. The enormous advantage the United States has with its great domestic market has instigated the formation of international combinations. All Europe is combining in drive for foreign markets.—Page 211.

Pig iron prices appear to have reached bottom, says Dr. Haney. However, he does not anticipate any real strength until steelmaking requirements increase relatively to iron output.—Page 208.

Producton efficiency increase is reported by majority of National Metal Trades Association members. Two-thirds of those replying to questionnaire say increase is due to plant extensions, new processes, wage incentive plans, etc.—Page 200.

The South is steadily increasing in importance as a market for industrial equipment and supplies. Close proximity of raw materials and consuming markets is a considerable factor in rapid expansion of manufacturing in Southeast.—Page 190.

Unfilled sheet orders attain largest volume in eight years. Independent producers report almost three-quarters of a million tons of orders on hand at beginning of year, equal to two months' full operations.—Page 212.

Will lower automobile prices start another cycle of price-cutting in metal trades supplying motor car builders? If lean profits are not to be further shaved, this is the psychological moment for a move just opposite to that of forcing prices down.—Page 218.

Is "more consolidations" the solution to profitless prices in steel industry? "Yes," says steel sales executive. When some units are eliminated prices will improve, he believes.—Page 215.

A simple way to identify nickel steel. Apply a drop of 50 per cent nitric acid to the steel. Blot it. Then coat the wet spot with di-methyl-glyoxime solution. If nickel is present the spot will turn strawberry pink. If nickel is absent, the spot will be reddish brown.—Page 202.

Smaller plants are cutting costs by making increasing use of material-handling equipment. The mistaken impression is fast disappearing that the use of labor-saving devices in moving materials is only for the larger plants. The flexibility of present-day material-handling equipment enables it to be adapted quickly and cheaply to changing conditions.—Page 219.

What Price Automobile Trade?

FROM many sources comes the prediction that 1928 will be a big year for automobiles. Mr. Raskob of General Motors even says it will be a 5,000,000-car year. Since not a little of the reaction of 1927 was blamed on Mr. Ford's shutdown, the inference is that general business will be quickened by any prosperity that comes to the motor industry this year.

But a small cloud already appears. Competition among the low-priced cars made by Ford, Chevrolet, Willys and Durant is to be most keen; there have been predictions, indeed, of something like a price war. This reminds those who sell to the automobile companies (steel mills, foundries and parts manufacturers) of other times when price reductions in finished cars meant increased pressure for lower prices on new materials, parts and other supplies. Is history to repeat itself, and 1928 find that the lean profits made by the metal-working industries in 1927 are to be further shaved to maintain motor-car surpluses intact?

Some leaders among the motor car builders are far-seeing enough to know that their industry is more than the big assembly plants; that it includes the organizations which make stampings, forgings and castings, and that the industry generally can not prosper if these essential adjuncts become profitless. Only last week Walter P. Chrysler was quoted by *Automotive Industries* as saying:

"When parts and accessory manufacturers don't get a reasonable profit on the units they sell to car manufacturers, it isn't a good thing for the industry; every branch of the industry should be getting fair returns to preserve a healthy condition for all."

Men who are in the habit of meeting the purchasing agents of the big motor companies will hardly expect to have the prices they receive under their contracts raised without notice. Nevertheless, they will agree with Mr. Chrysler's sentiments and, if their salesmanship has any better basis than the brute argument of a lower price, will see to it that added volume of business gives them added income. In all probability there will be a great demand in 1928 for parts and accessories, and for the bars and sheets to make them. Already this portion of the industry is going strong; some of the stamping plants are running 24 hours a day. With this urge for production, it is clearly not the time for any attempt to force prices down closer to the rock bottom from which they have been so thinly separated all through 1927.

In fact, it is the psychological moment for just the opposite move. Efforts for higher prices are quite likely to be resisted strongly by automobile purchasing departments and there may be strong threats to place the work elsewhere. But often underneath such maneuvering there is the intention to stretch a point to stick to old business friends, because they can be relied upon to produce acceptable materials, worthy of the car they are built into, and with deliveries that can be depended on to meet production schedules. Such service as many parts and materials manufacturers are giving cannot be continued without reasonable profit, and seldom can it be duplicated satisfactorily by a competing firm at a lower price.

Mr. Chrysler is right. We commend his utterance not only to those metal-working companies to which the automotive industry gives such large employment but to those steel manufacturers who sell sheets, bars and other products to the car builders. After all they have done in the past year to secure better selling and better distribution it should not be easy now to start them again on the vicious circle of price-cutting to increase volume, to get costs down, to get more business, and so on in the demoralizing process that in the end profits buyer no more than seller.

Profits from Improvements

EARNINGS of fourteen leading producers of iron and steel represented barely 4½ per cent on investment in the third quarter of 1927, and the fourth quarter returns were probably even less favorable. A condition is indicated that calls for remedies. Much attention has been given to the reduction of costs, but heavy outlays in improvements for that purpose are sometimes ill-advised.

It is so readily taken for granted that improvements will pay for themselves that the chances of their not doing so are frequently overlooked. Whether the outlay be for a plant addition, decreasing production costs or increasing tonnage and thus distributing overhead, or for a new type of mill replacing the current type, the expenditure should be got back within a relatively short period of years, since further improvements in methods or equipment may be developed.

Investment in plant and equipment is justified when additional profit accumulates to pay the cost of the improvement. But in some cases price cuts are based on the decreased cost and legitimate earnings are sacrificed. The computations on which the earning power resulting from the expenditure was based are nullified by the sales policy, and the company is injured by one department's failure to cooperate with another department. Moreover, competitors following a more enlightened policy are deprived of profits to which they are entitled and their ability to finance improvements is curtailed. The net result, unfortunate for the individual producer, may be unfortunate for the trade at large.

Methods of selling the various finished steel products are influenced by a complicated market with intricate details. By no means is it to be inferred in each instance that lower prices are to be attributed to the sellers, sometimes few in number, with recently improved equipment and reduced costs. Producers with older equipment in many cases may be responsible. They may feel more menaced than the lower-cost producers and indulge in more strenuous and unintelligent competition than they would otherwise practice. By so doing, however, they cut off the opportunities they might have for making similar improvements, besides destroying the earning power of the improvements already made.

It is as disadvantageous to the country at large as it is to the industry itself for the steel market to move in such fashion. Improvements may even become burdens if they are forthwith made the basis of new price cuts.

Materials Handling in Smaller Plants

DIMINISHING margins between costs and selling prices have cut heavily into profits in manufacturing in the past three years. As a result, it has been found necessary to cut costs in every available way. This has been accomplished in the main without cutting wages. One of the principal elements in this campaign has been a larger and larger utilization of materials-handling equipment.

Formerly it was considered almost axiomatic that equipment of this character could be installed only by large companies having heavy financial resources. More recently it has come to be realized that this point of view is erroneous. Smaller companies are making great use of labor-saving devices in moving materials from one process to the next, from receiving platform to storage or to process and from the finishing operation into warehouse or to shipping platform. An interesting example is covered in our leading article of this week.

A principal feature of materials handling in its present-day form is the flexibility both of the individual units and of systems. This makes it possible to alter the use to which certain elements are put as soon as changing conditions call for it. One company, which has a large amount of overhead tramrail in use, is reported to be making changes continually as requirements of one department or another call for it. In fact, it is said that there is less than 50 ft. of straight tramrail in any one section in that plant, although several miles of system are used.

Where it is possible to relocate tramrail on short notice and at low expense in this manner, it is obvious that small systems, consisting of one or two or half a dozen short stretches of such overhead track, may be utilized in a smaller plant, and at a cost commensurate with the extent of use. Expansion in plant or in product would be accompanied as a matter of course by increased handling facilities, as required.

Electric lift trucks, together with an assortment of skids to be handled by these trucks or by the tramrail system or both, form another convenient means of utilizing power in place of brawn in a small plant. Initial cost, together with upkeep and operating expense, may be proportioned to the needs and to the quantity of material to be handled. These machines can go where it would not be feasible to put rails except in an extensive system. They can negotiate moderately rough ground outside the buildings, if necessary. In some instances they have been used to carry materials for two or three blocks over city streets. Thus, their flexibility is great and their help to the smaller plant should be correspondingly large.

A Too Costly Navy

A COMPLETE discussion of the naval program recently presented to Congress would require volumes. Much of it will be undertaken in the forthcoming hearings and debates at Washington. It is to be hoped that the next few months will bring the American public into a better acquaintance with the real function of the Navy. The country will have also to decide how much it should spend for a merchant marine, for the two problems of commerce and Navy are closely interlinked.

It is necessary now to consider whether the proposed plans can be harmonized with the public statements of our national officials. It has been said frequently by members of the administration that the United States has not and does not intend to enter upon a naval competition. Yet the 1928 issue of Brassey's *Naval Annual* (a recognized technical authority) says that recently there has arisen "serious competition in the new type of 10,000-ton, 8-in. gun cruisers" capable of developing high speeds. This book gives the following data:

	Nearly Completed	Building	Authorized	Total
Great Britain..	5	8	1	14
United States..	2	6	..	8
Japan	0	6	1	7
France	1	3	1	5
Italy	0	2	..	2

To this table a supplementary item should include the ten 34-knot scout cruisers of the Memphis class, displacing 7500 tons and mounting 6-in. guns, completed about four years ago.

The feeling that the navies are over-reaching themselves in this matter was expressed in the cheers which greeted the announcement made before the House of Commons that the British Admiralty had decided to authorize but one of the three projected cruisers in 1928.

In the face of this situation and sentiment, the general board of our Navy asks Congress to lay down twenty-five more of these ships by 1933, and coolly says it does not intend to indulge in any competition.

Despite the official assurance that this program (including an important number of auxiliary ships) is devised entirely to meet our own needs, and should not lead to competitive building, it is proper to ask whether 250,000 tons of modern cruisers would, in fact, be regarded by the other great powers as a serious threat. One who is acquainted with the proceedings at the Geneva conference to limit auxiliary naval craft (summarized in THE IRON AGE for Sept. 15, 1927) cannot help but conclude that the powers would so regard an overpowering strength in any category.

It should be remembered that the United States representatives proposed at Geneva that the cruiser tonnage be limited to 250,000 tons total, or at most 300,000 tons. They could not agree with the British minimum counter proposal to limit total cruisers of all sizes to 400,000 tons.

Now contrast our Geneva protestations of a desire for 250,000 tons of cruisers with our present project: 18 first-line cruisers already built or building, with a total displacement of 155,000, plus 25 of the 10,000-ton boats in the new Navy proposal. Forty-three cruisers in all with a total tonnage of 405,000. If the present proposals represent our real needs, as the Navy experts keep reiterating, then our needs have grown amazingly in the last seven months, or else there was a blunder in not snapping up the British offer of parity at 400,000 tons made at Geneva. (Of course, the Japanese were strongly opposed to signing any such expansion agreement in a conference to "limit" armaments, but if Japanese sentiment can be disregarded now, it could equally well be disregarded then.)

It is difficult for the layman, even for the naval expert, to arrive at any appraisal of our country's *needs* in the way of a fleet. It should be remembered that the fast 10,000-ton cruisers are exceedingly formidable warships, more pugnacious than the full-fledged battleship of 25 years ago. The term "light cruiser" therefore misrepresents the craft. British experts look upon them as secondary ships for combat purposes, and believe that the eighteen battleships now authorized require twelve to sixteen of the 10,000-ton cruisers to round out their battle fleet. Since we have parity with Great Britain in battleships, and since we have eight first-line cruisers now under way, and ten scout cruisers in commission, our *needs* for combat purposes are fairly well met.

Consequently it may be concluded that the new twenty-five ships are for commerce protection, which task Great Britain relegates to much less aggressive ships weighing about 5000 tons. Whether our trans-oceanic shipping is extensive and important enough to warrant a cruiser-building program costing us $400,000,000 in initial outlay (and even more to the other nations in their efforts to keep up), and arousing in addition the suspicions of the maritime powers, is a question worthy of careful thought.

Furthermore, protection against what? Just now we do not fear Great Britain, and "for the rest, Anglo-American friendship *must* be maintained."

Guidance for Business

NEVER were so many facts and so much advice put before American business men on the course of industry and trade as they have been considering in the past few weeks. And never were leaders in industry more put to it for satisfying answers to their questionings of the new year. What Col. Frank A. Scott says in this paragraph from his contribution to THE IRON AGE of Jan. 5 was written for the machine tool trade, but may well be pondered on by leaders in every department of iron and steel manufacture, and in all the industries which have iron and steel for their raw materials:

> There has been enough prosperity to go around most years since the war, but American metal workers have seemed oblivious of this. From the steel makers right through to the small fry they have intensified an already highly competitive situation by over-extension of sales efforts. This cannot continue. Industry can advance only when it is profitable. There is an opportunity here in the American metal-working field for business leadership of a high type. Schooling is needed in the development and maintenance of a code of business ethics which shall include serving the trade well, while maintaining a price level sufficiently high to sustain normal development and yield a profit.

The Road That Taps Katanga

AN important event of Nov. 27 was the completion of the Benguela Railway to the Angola-Belgian Congo border in Africa. The Belgian Congo Government is now rushing its own part of the line, about 460 miles in length, which will link the Benguela Railway with the line that runs eastward to Beira. When this has been done there will be an east-west transcontinental line, about 2600 miles in length across the southern half of Africa; and since it passes right through the great copper ore region of Katanga, the metal thereof will have to be carried only about 1250 miles by rail and 4900 miles by sea, instead of 1350 miles by rail and 8000 miles by sea as heretofore.

This is an event reminiscent of the uniting of our own Pacific railroads, which were connected about 60 years ago, and for which the inspiration was likewise the opening of mining regions. Ever since Jason and his Argonauts went in search of the Golden Fleece, which we believe to have meant placer mines, the metals, precious and base, have always been the incentive to great pioneering.

Robert Williams conceived the Benguela Railway twenty-five years ago. Until three or four years ago he had to struggle for the money with which to build it. Then it became appreciated that Katanga was one of the greatest copper regions ever discovered and that its exploitation was being retarded not only by the roundabout and costly transportation for its service, but also by the physical incapacity of all available lines to carry the tonnage that it offered. So at length the new line was vigorously adopted and consummated. It will greatly cheapen Katanga copper and will swell the world's supply.

That is not altogether welcome to American copper producing interests, but they are sufficiently sporting to view the success of other fellows with good grace. The Katanga mines are controlled in Belgium and have done much to rehabilitate that chivalrous little country, where they are regarded as something akin to holy. In consequence, brokers who have suggested that they might be sold at a fine figure to some American colossus have been regularly given the cold shoulder.

Metricists Bearding the Lion

GREAT BRITAIN apparently is going through the throes of agitation in favor of compulsory use of the metric system, just as is the United States. At a recent meeting of the "Decimal Association" in London it was pointed out that the use of metric weights and measures was made lawful for general trade in Great Britain 30 years ago. But "the trading community as a whole have not manifested any eagerness to take advantage of this permissive legislation," to quote from one report read at the meeting.

As in the United States, the metric system has not appealed in Great Britain to those who make largest use of weights and measures in carrying on exacting work. It has been permissible in the United States much longer than in Great Britain; but here, too, it has failed to make headway. It simply does not fill the needs in general of manufacturers of most products. If it did, it would long ago have been adopted as standard.

Proponents argue that it is essential in developing foreign trade. That this assumption is false is shown by the fact that Great Britain and the United States, the two great exporting countries of the world, have built up their enormous overseas commerce without the use of the metric system. Together they control one-third (42 per cent, if the British Dominions be included) of all the external trade of the three-score or more of countries participating in foreign trade. This proportion is not diminishing, in spite of the dire predictions of the metricists. Neither is it likely to do so.

Road-Building Developments Create New Uses for Steel

Exhibit of Equipment at Cleveland Emphasizes the Growing Demands of Builders Upon Steel Makers and Other Metalworking Manufacturers

THE prominence that the building of road-making machinery has attained, the growing demands of builders of this equipment upon steel makers and other manufacturers in the metalworking field, the large number of metalworking industries that supply parts or equipment for road building and the building of road-making equipment and the increased use of iron and steel, including new uses in the road building industry, were some of the impressions gained by a visit at the exposition held in connection with the twenty-fifth annual convention of the American Road Builders' Association held at the Public Hall, Cleveland, last week. The exhibit, for years conspicuous for its size, was larger than ever before. The machinery and other equipment displayed amounted to 300 carloads.

Conveying and handling equipment including cranes of many types, conveyors, hoists, elevators, tractors, industrial locomotives, trucks, trailers, steam shovels, buckets and winches were shown in a large number of exhibits. Other manufacturers showed concrete mixers, excavators, crushers, graters and other special machinery used in road building.

The tendency among builders of road making machinery, as indicated by the exhibit, is to improve their labor-saving machines by improved design and construction and the use of better materials to withstand hard service. Many of the machines were equipped with high friction bearings, the use of which has spread rapidly in this field and several makers of roller bearings had exhibits.

The wide scope of the exhibits gave some indication of the number of metalworking industries that share in the benefits of road-building activities. The products of these industries included axles, stampings, truck bodies, bins, chipping hammers, air compressors, pneumatic and electric drills, motors, engines of various types, forgings, gears, pumps, screens, manganese and alloy steel castings and reinforcing steel wire mesh. Steel castings were exhibited by a number of foundries.

New uses for steel and possibilities for greater uses in certain fields were shown in some of the exhibits and quite a few indicated that manufacturers of some general lines, such as stamping, are turning their attention to specialties. A number of exhibits of pressed steel road, curb and sidewalk forms and other forms used in concrete construction indicate that considerable steel is being used in that particular field. Another exhibit was a steel paving guard to protect the edges of paving. Galvanized culverts and perforated steel drain pipe were shown by several manufacturers and centrifugally cast culvert pipe was exhibited by the American Casting Co., Birmingham. Stamped steel liner plates to take the place of timbering in tunnel construction were shown by the Commercial Shearing & Stamping Co., Youngstown. A snow fence with boards of galvanized sheets attached to pressed steel supports is a new product to replace the wood fence that has long been used for this purpose. This was shown by the Northfield Iron Co., Northfield, Minn. One manufacturer showed a track for use particularly by contractors on short sections of muddy roads that would otherwise be impassable for trucks. This is made of heavy gage curved troughs providing traction for wheels, the troughs being held in parallel position by corrugated struts. It is built in 10-ft. sections for easy handling and raising.

Metal wheels of numerous types were shown and some of these types indicated a broadening of the field for these wheels as a substitute for wood wheels. Manufacturers report considerable increase in the demand for steel wheels with rubber tires for use on threshers and other portable machines that are hauled on concrete roads. Among the numerous exhibits of steel wheels by French & Hecht, Davenport, Iowa, was a new rubber-tired wheelbarrow wheel.

Cable guard rail for protecting the dangerous points in highways is now affording considerable outlet for steel, not only for the cable but also for the supporting members. A guard rail having supports of malleable castings constructed with springs and equalizers to afford resiliency in order to absorb the forces of severe impact was exhibited. The Cleveland Hardware Co., Cleveland, showed a line of anchor rods, cable I bolts and other drop forge parts that it has brought out for use in erecting cable guard rails. Another new drop forge product exhibited by this company is an open eye snap for use in attaching tire chains to truck wheels.

Iron and Steel Markets

Better Balanced Steel Market

With Increasing Demands from Automobile Industry and Heavier Requirements in Other Consuming Lines, Steel Output Continues to Broaden—Prices Firmer

FINISHED steel requirements are not only growing in volume, but are becoming better balanced. Avenues of consumption that only recently were taking relatively small tonnages of steel are making heavier drafts on mill production.

The outstanding example is the automobile industry with its steadily mounting demands. Railroad buying is also a major market factor, with a continuance of rail contracting and the promise of additional large purchases of cars and locomotives. In tin plate, increased specifications for March and April shipment have brought output up to 75 per cent of mill capacity.

While demand for tubular products continues to lag, the oil industry is taking more well pipe and two large line pipe inquiries, one of them for 14,000 tons, have appeared in southern California. Oil storage tanks, particularly for western Texas, call for a steady flow of plate tonnage. Meanwhile better farmer buying is reflected in the high output of implement plants, and a sustained volume of construction work is indicated.

Steel output continues to gain, although at a retarded rate. At Chicago, a leading center for railroad buying, two steel works blast furnaces have gone in, making a total of five blown in since Jan. 1, and ingot output has reached 80 per cent of capacity. At Pittsburgh the Carnegie Steel Co. has lighted a furnace and is preparing to blow in another. In the Youngstown district, however, a recession in new orders and specifications has delayed further increases in production. The operations of Steel Corporation plants are estimated at 78 per cent, as against 75 per cent a week ago.

Steel specifications from the motor car industry, in the case of some mills, are almost double the releases of last month. Bars, sheets, strip steel, alloy steel bars and bolts and nuts have all been affected by the increasing requirements of automotive plants. With a large supply of cars needed to stock dealers with new models, heavy automobile production seems assured for the first quarter at least. Current output is estimated at 20 to 25 per cent above January, last year, when 238,926 cars and trucks were manufactured. Automobile parts plants are operating at full capacity, and a Cleveland drop forge company has placed an order for 3500 tons of alloy steel bars. The gain in automobile output has brought the index of employment in Detroit to the highest point since the summer of 1926.

Fresh business in steel from other sources, although in reduced volume following heavy specifying in December, exceeds expectations. A fair volume of small-lot orders for bars, plates and shapes is coming from buyers who underestimated their needs or, in adhering to a hand-to-mouth buying policy, failed to take advantage of lower prices.

Prices generally are well maintained, and in some lines are stronger. Makers of cold-rolled strip have announced an advance of $3 a ton, and, following the stiffening of prices on plate mill sizes of wide strip, the plate market is more firmly established at 1.80c., Pittsburgh. Stronger prices on hot and cold-rolled strip will mainly affect second quarter business, since most mills are well booked for the current quarter. Similarly, an effort to advance plates, shapes and bars, now regarded as an early possibility, would have comparatively little effect on invoiced prices until next quarter.

For recent railroad car orders 15,000 tons of plates has been scheduled at Chicago mills. While the week's car buying was confined to a few hundred cars, an inquiry for 2000 refrigerator cars from the Pacific Fruit Express is expected to be the forerunner of another bulge in equipment buying. The Illinois Central's expected inquiry may call for 4000 cars.

Rail orders totaled about 25,000 tons at Chicago, of which 15,000 tons was for the Pere Marquette, while at Cleveland the Nickel Plate ordered 11,500 tons. Additional rail inquiry now definitely before Chicago mills from Western roads amounts to 75,000 tons.

Chicago and Cleveland have led in pig iron sales, and the total of first quarter buying at Chicago in December and so far this month has exceeded 300,000 tons, while at Cleveland 25,000 tons has been added to recent heavy purchases. Ohio and Michigan foundries producing automobile castings are increasing their melt, and furnaces which serve them expect to reduce their stock piles, as they probably will ship more iron this month than they make. New York iron sales were 10,000 tons, and at Philadelphia buying has been increased to take advantage of quotations made before the 50c. price advance on foundry grades, now effective.

Structural steel lettings at Chicago totaled 13,000 tons. At Cleveland 20,000 tons is required for three buildings for the Cleveland Union Terminals Co., bringing the total of pending fabricated steel work to more than 41,000 tons.

Fabricated structural steel bookings of 205,165 tons in December brought the year's total to 2,750,700 tons, or 72 per cent of capacity. This exceeded 1926 by nearly 8 per cent and, except for 1925, is the highest total on record.

Greater strength in foundry iron in eastern Pennsylvania has advancd THE IRON AGE pig iron composite price to $17.67, from $17.59 last week.

On export business there are frequent variations from the above prices. Also, in domestic business, there is at times a range of prices on various products, as shown in our market reports on other pages.

Pittsburgh

Automobile Industry Specifying Steel Freely—Price Tendency Firmer

PITTSBURGH, Jan. 17.—There is active specifying of steel by the motor car industry and some manufacturers serving that industry find this month has almost doubled the tonnage releases of last month. Otherwise the steel market is in one of those digestive periods that almost invariably follow heavy specifications and are attended by heavier shipments than new orders. In bars, plates, shapes, sheet and wire nails, the market is quieter than it has been though there has been some acceleration of shipments from the mills directly into consumption. The situation also is somewhat irregular as to steel works and rolling mill operations. While the larger units have succeeded in getting ingot production up to about 75 per cent of capacity, the smaller companies still lack sufficient business to furnish a 65 per cent operation.

If there is a definite tendency to prices, it is higher. Sheet makers have succeeded in getting full quotations on small lots of the ordinary finishes and some satisfaction is taken from the fact that on a recent railroad inquiry for black sheets the price named by 12 of the 13 mills which quoted was 2.90c., base, Pittsburgh. Following the recent revision of hot rolled strip prices, cold rolled strip makers have announced a minimum price of 2.90c. on lots of three tons and over and 3.15c. on less than three tons. Incidentally, the adoption of prices on wide strips, based on plates at 1.80c., has done much to clarify the price situation in the latter product. Wide strip makers seeking business in plate mill sizes and gages usually encountered 1.75c., base, on plates, the price that consumers still are enjoying on tonnages specified prior to the end of last month, and to get orders it was necessary to meet or go below that price.

It would not be surprising if in the effort to correct what is commonly said to be an unfavorable price situation, manufacturers with an eye to second quarter business would soon stiffen up on plates, shapes and bars. The recent strengthening in strip prices is largely for its effect upon second quarter tonnages. It is pretty generally conceded that order books in sheets are too heavy for higher prices to become effective in this quarter and the situation is not greatly different in wire nails. Higher prices are asked on reinforcing bars.

Motor car builders continue to exert considerable pressure against steel prices in the effort to maintain profits in the face of lower prices for the cars, but there is no evidence of success in that direction.

The Carnegie Steel Co. recently lighted one of its Carrie furnaces and is said to be getting ready to start another of that group. These furnaces serve the Homestead Works, which lately has had a considerable increase in mill operations. In the Youngstown district an independent steel works furnace was scheduled to start this week, but lighter orders brought a postponement.

There is little activity in the pig iron market. Scrap prices are yielding under the lack of consumer interest in supplies and freer offerings, which encourage dealers to defer covering against short sales. Slack coal is firm in price, but the coal and coke market as a whole still labors under an excessive supply.

Pig Iron.—A Grove City, Pa., consumer recently closed for about 1500 tons of foundry iron, most of which was of special analysis for engine cylinders. In the sale was 500 tons of No. 1 foundry, which was sold at $18.25, with the sale based at Sharpsville, Pa., having a freight rate to destination of $1.39, compared with $1.64 from other Valley points. This is the only recent sale of importance, other transactions in foundry iron running to single carloads. Only small sales of Bessemer and malleable iron are noted and interest in basic iron is very low. Some talk is heard of an advance in prices, but the market this week gives no real evidence of such a development.

Prices per gross ton, f.o.b. Valley furnace:

Basic	$17.00
Bessemer	17.50
Gray forge	16.75
No. 2 foundry	17.25
No. 3 foundry	16.75
Malleable	$17.25 to 17.50
Low phosphorus, copper free	27.00

Freight rate to the Pittsburgh or Cleveland district, $1.76.

Ferroalloys.—A good movement of the commonly used ferroalloys is noted on contracts in keeping with the larger consumption incident to heavier steel works operations. Producers have yet to benefit from the December advance of $10 a ton in ferromanganese, as much of the material now moving to consumers is against December specifications on old contracts or sales made for December shipment at about the time the advance was made. A few consumers have not yet contracted for tonnages for first half of 1928 shipment.

Semi-Finished Steel.—The decline in sheet bars reported from Cleveland has not extended to this or the Youngstown district, where producers still are quoting $34. At Youngstown a fairly large movement at that price is reported. Pittsburgh no longer is much of a market for sheet bars, as the few mills that buy them are covered by requirement contracts with regular sources of supply and their buying is no longer subject to open competition. The tonnage here is greater in billets and slabs and no sales are noted at under $33, base. Wire rods are priced at $42, base Pittsburgh or Cleveland, but only a few small sales are being made at that price, as most users are covered for this quarter at a lower figure.

Rails and Track Supplies.—The Nickel Plate road is in the market for 3000 to 4000 tons of spikes and tie plates. Generally, the demand for track supplies is of moderate proportions, but producers have fair-sized orders for shipment later with the starting of rail laying. The local standard-section rail mill is running well and has sufficient business to carry it well through the spring months. Light section ralis are slow. Prices are firm.

Wire Products.—Manufacturers are well satisfied with the price situation, for while they are yet to profit much by the higher schedule on nails, at least they are encountering no deviations from that schedule. Shipments of nails are heavy, with distributers still getting the benefit of the old price and the old card of extras, since the current movement is largely on specifications on old contracts.

Tubular Goods.—The volume of pipe business does not vary much, but some makers note a slightly improved demand for oil country pipe, especially from California. Oil statistics are favorable on the score of production, but unfavorable in the amount above the ground. Standard-weight pipe will do better as building and construction activities increase. Boiler tubes still are slow but some improvement is reported in mechanical tubing as automobile builders increase production.

Sheets.—Continued gain in the orders from automobile and automobile body builders is the bright spot in the situation. Strictly new business is moderate, because so many consumers are already covered against their requirements for this quarter and generally at lower prices than now are asked. Prices show the firmer tendency that usually accompanies full order books, although it is not possible yet to quote a single price on each grade. Some business in black sheets is being taken at 2.90c., base, Pittsburgh, and that price was quoted by 12 of the 13 mills that entered prices against the New York Central inquiry. The American Sheet & Tin Plate Co., last week operated 72 per cent of its sheet mills and independent companies at approximately 90 per cent.

Tin Plate.—Tin plate mill operations still are on the increase in keeping with the fact that specifications for March and April shipments are fairly heavy. This branch of the industry now has at least 75 per cent of capacity engaged. Prices are firm.

Cold-Finished Steel Bars and Shafting.—As there were heavy specifications last month for shipment in January it was expected this month would see a substantial lessening in orders, but the more common experience of makers here is that orders and releases are not materially smaller than in December. Prices are firmly maintained. The leading maker of turned and ground shafting has announced an advance of $2 a ton effective Jan. 16, and now is quoting carloads, f.o.b. mill, 1 3/16-in. to 1½-in., 2.90c., base; 1 9/16-in. to 1⅞-in., 2.75c.; 1 15/16-in. to 2⅞-in., 2.60c., and 2 15/16-in. to 7-in., 2.45c., the prices being subject to the standard card of extras dated Dec. 24, 1927. This calls for an extra of 10c. per 100 lb. for shipments of less than carload lots and for quantity extras for lots of 4000 lb. and has obviated the necessity of the former charge of 25c. per 100 lb. for less than carload lots.

Bolts, Nuts and Rivets.—The movement of bolts and nuts has shown measurable improvement this month over December, but the same betterment has not occurred in rivets. Prices are firm.

Bars, Plates and Shapes.—New releases and specifications have been lighter in the past week, but this is regarded merely as the result of the fact that consumers have been getting heavy shipments against orders given last month. The plate market appears firmer

Alloy Steel Bars

(F.o.b. Pittsburgh, Chicago or Ohio Mill)

S. A. E. Series Numbers		*Base Per 100 Lb.*
2100*	(½% Nickel, 0.10% to 0.20% Carbon)	$2.90 to $3.00
2300	(3½% Nickel)	4.00 to 4.10
2500	(5% Nickel)	5.00 to 5.25
3100	(Nickel Chromium)	3.00 to 3.10
3200	(Nickel Chromium)	4.75 to 5.00
3300	(Nickel Chromium)	6.75 to 7.00
3400	(Nickel Chromium)	6.00 to 6.25
5100	(Chromium Steel)	3.00 to 3.10
5200*	(Chromium Steel)	7.00 to 7.50
6100	(Chrom. Vanadium bars)	4.00 to 4.15
6100	(Chrom. Vanad. spring steel)	3.50 to 3.75
9250	(Silicon Manganese spring steel)	3.00 to 3.15
Carbon Vanadium (0.45% to 0.55% Carbon, 0.15% Vanad.)		4.10 to 4.20
Nickel Chrome Vanadium (0.60 Nickel, 0.50 Chrom., 0.15 Vanad.)		4.05 to 4.20
Chromium Molybdenum bars (0.80—1.10 Chrom., 0.25—0.40 Molyb.)		4.00 to 4.25
Chromium Molybdenum bars (0.50—0.70 Chrom., 0.15—0.25 Molyb.)		3.05 to 3.10
Chromium Molybdenum spring steel (1 — 1.25 Chrom., 0.30 — 0.50 Molybdenum)		4.50 to 4.75

Above prices are for hot-rolled steel bars, forging quality. The ordinary differential for cold-drawn bars is 1c. per lb. higher. For billets 4 x 4 to 10 x 10 in. the price for a gross ton is the net price for bars of the same analysis. For billets under 4 x 4 in. down to and including 2½ in. squares, the price is $5 a gross ton above the 4 x 4 billet price.

9 and 10	45	32½	9 to 12	16	2
11 and 12	44	31½			

To the large jobbing trade the above discounts on steel pipe are increased on black by one point, with supplementary discount of 5 and 5%, and on galvanized by 1½ points, with supplementary discount of 5%. On iron pipe, both black and galvanized, the above discounts are increased to large jobbers by one point with supplementary discounts of 5 and 2½%.

Note.—Chicago district mills have a base two points less than the above discounts. Chicago delivered base is 2½ points less. Freight is figured from Pittsburgh, Lorain, Ohio, and Chicago district mills, the billing being from the point producing the lowest price to destination.

Boiler Tubes

Base Discounts, f.o.b. Pittsburgh

Lap Welded Steel		*Charcoal Iron*	
2 to 2¼ in.	27	1½ in.	+18
2½ to 2¾ in.	37	1¾ to 1⅞ in.	+ 8
3 in.	40	2 to 2¼ in.	— 2
3¼ to 3¾ in.	42½	2½ to 3 in.	— 7
4 to 13 in.	46	3¼ to 4½ in.	— 9

Beyond the above discounts, 7 fives extra are given on lap welded steel tubes and 2 tens to 2 tens and 1 five on charcoal iron tubes.

Standard Commercial Seamless Boiler Tubes

Cold Drawn

1 in.	60	3 in.	45
1¼ to 1½ in.	52	3¼ to 3½ in.	47
1¾ in.	36	4 in.	50
2 to 2¼ in.	31	4½, 5 and 6 in.	45
2½ to 2¾	39		

Hot Rolled

2 and 2¼ in.	37	3¼ and 3½ in.	53
2½ and 2¾ in.	45	4 in.	56
3 in.	51	4½, 5 and 6 in.	51

Less carloads, 4 points less. Add $8 per net ton for more than four gages heavier than standard. No extra for lengths up to and including 24 ft. Sizes smaller than 1 in. and lighter than standard gage to be held at mechanical tubes list and discount. Intermediate sizes and gages not listed take price of next larger outside diameter and heavier gage.

Seamless Mechanical Tubing

	Per Cent Off List
Carbon, 0.10% to 0.30%, base	55
Carbon, 0.30% to 0.40%, base	50

Plus differentials for lengths over 18 ft. and for commercial exact lengths. Warehouse discounts on small lots are less than the above.

since the recent announcement of wide strip makers of an observance of 1.80c., base, on the plate mill sizes of wide strips. Structural lettings have not yet reached proportions that mean heavy drafts upon the mills for plain material. Reinforcing bars are held for higher prices and only regular mill distributers now are able to get supplies at less than 1.90c., base.

Old Material.—The market still shows a tendency to soften, as there is no consumer interest and the only demand is from dealers who have short orders to cover. They are not being pressed for shipment and have cut their bids. The steel mills, with greater operations than a month or so ago, are producing more scrap and a good deal of compressed and bundled sheet scrap is being offered. For heavy melting steel, mills are not allowing more than $15 on overshipments and few dealers will go higher to cover short sales. The leading consumer of machine shop turnings in this district is offering only $10, but there is no evidence that sales have been made at less than $11. Heavy breakable cast scrap, which sold recently at $14, delivered Wheeling, cannot be sold at more than $13.75 now and one user still offers only $13. Dealers short of heavy axle turnings are offering up to $14, but that is more than consumers will pay.

Prices per gross ton delivered consumers' yards in Pittsburgh and points taking the Pittsburgh district freight rate:

Basic Open-Hearth Furnace Grades:	
Heavy melting steel	$15.00 to $15.25
Scrap rails	14.50 to 14.75
Compressed sheet steel	14.00 to 14.25
Bundled sheets, sides and ends	13.00 to 13.25
Cast iron carwheels	14.00 to 14.50
Sheet bar crops, ordinary	15.00 to 15.50
Heavy breakable cast	13.00 to 13.75
No. 2 railroad wrought	15.00 to 15.50
Heavy steel axle turnings	13.00 to 13.50
Machine shop turnings	11.00
Acid Open-Hearth Furnace Grades:	
Railroad knuckles and couplers	17.00 to 17.25
Railroad coil and leaf springs	17.00 to 17.25
Rolled steel wheels	17.00 to 17.25
Low phosphorus billet and bloom ends	18.50 to 19.00
Low phosphorus, mill plate	17.50 to 18.00
Low phosphorus, light grade	16.50 to 17.00
Low phosphorus sheet bar crops	17.50 to 18.00
Heavy steel axle turnings	13.00 to 13.50
Electric Furnace Grades:	
Low phosphorus punchings	16.50 to 17.00
Heavy steel axle turnings	13.00 to 13.50
Blast Furnace Grades:	
Short shoveling steel turnings	11.50 to 12.00
Short mixed borings and turnings	11.50 to 12.00
Cast iron borings	11.50 to 12.00
No. 2 busheling	10.00 to 10.50
Rolling Mill Grades:	
Steel car axles	18.00 to 19.00
No. 1 railroad wrought	11.00 to 11.50
Sheet bar crops	17.00 to 17.50
Cupola Grades:	
No. 1 cast	14.50 to 15.00
Rails 3 ft. and under	15.00 to 15.25
Malleable Grades:	
Railroad	15.00 to 15.25
Industrial	14.50 to 14.75
Agricultural	14.00 to 14.25

Wire, galvanized soft, base per 100 lb.	3.00 to 3.10
Common wire nails, per keg	3.00
Cement coated nails, per keg	3.05

Hot-Rolled Flats.—Specifications from the automotive industry are extremely heavy. Good as was the start of last year, this year is better, and it is not uncommon to find makers whose order books this month are double those of December. Most mills now are on a basis of 2.10c., base, for strips narrower than 6 in., and 1.90c., base, for 6 in. to 12 in. For very narrow stock the range is from 2.10c. to 2.30c.

Cold-Rolled Strips.—Mills are well committed against probable production for this quarter and are getting such heavy specifications that in some cases deliveries are not made as promptly as was the case recently. An announcement of a minimum price of 3.15c., base, or 2.90c. on three tons or more, is a sign of dissatisfaction with present prices.

Coke and Coal.—So much of the demand for coal is in run of mine grade that the supply of slack coal is pretty scant and producers are able to sell it at better prices than have lately prevailed. But the coal market as a whole shows no improvement either in prices or demand and it is frequently necessary for companies that are keeping mines in operation to sell accumulations at sacrifice prices. The beehive oven coke market also is dull and depressed. Producers without regular consuming connections find it very difficult to dispose of their outputs except at lower prices than they would name against an inquiry.

Spang, Chalfant & Co., Standard Seamless Tube Co., Oil Well Supply Co. Merge

PITTSBURGH, Jan. 16.—A merger that has long been rumored was consummated today when Spang, Chalfant & Co., Inc., one of the oldest manufacturers of welded pipe in the country, and the Standard Seamless Tube Co., one of the leading seamless pipe manufacturing companies, were consolidated under the name of Spang, Chalfant & Co. As part of the transaction the new company has acquired an interest in the Oil Well Supply Co. and obtains a voice in the management of a company maintaining 90 distributing branches in the oil producing districts in this country and abroad.

There were reports as long ago as the middle of last year that a merger of these two pipe companies was under negotiation, but verification was lacking. In view of the strong drift toward seamless pipe to replace welded pipe, it had been expected that Spang, Chalfant & Co. would eventually follow other welded pipe manufacturers in installing seamless pipe making capacity. The merger provides this capacity and incidentally obviates an addition to the total seamless pipe producing units, which in some quarters are believed to be numerous enough already.

Spang, Chalfant & Co., Inc., which this year observes the hundredth anniversary of its founding, operates the old Etna Iron & Tube Works, Etna, Pa., just outside the Pittsburgh city limits to the north, which was established in 1828. Besides four trains of 16-in. and 12-in. skelp mills, which have not been operated in recent years, the plant contains three buttwelding and four lapwelding furnaces, with an estimated annual capacity of 300,000 tons of sizes ranging from ⅛ in. to 24 in.

The Standard Seamless Tube Co. has a plant at Ambridge, Pa., containing two complete seamless pipe units, which are estimated to be capable of producing 300,000 tons of pipe from 1 in. to 14 in. in diameter annually. This company, which originally produced seamless steel boiler tubes, has in recent years specialized in oil country pipe.

Sharon Steel Hoop Co. to Issue $7,000,000 Bonds

The Sharon Steel Hoop Co., of which Severn P. Ker is president, is negotiating a bond issue of $7,000,000 to refund existing obligations and provide working capital for extensions. Ground has been broken for a new cold rolled strip mill, while work has started on an enlargement of the company's pickling plants.

Upset set screws	80, 10 and 10
Milled studs	70 and 5

Chicago

Ingot Rate at 80 Per Cent—Steel Orders Show Increase

CHICAGO, Jan. 17.—The Steel Corporation has blown in two blast furnaces, one at Gary and one at South Works. These bring the number of stacks lighted since the first of the year to five and make the total count of active steel mill furnaces 26 out of 36. Further evidence of improvement in this market is given by the fact that ingot output has reached 80 per cent of capacity. Producers point to fresh sales that are 40 per cent above the average week in 1927 and new specifications that are 66 per cent heavier as indications that the rate of ingot production will be well maintained if not bettered in the immediate future.

Soft steel bar output at 85 per cent of capacity leads other heavy tonnage finished steel products, though structural material does not lag far behind. Unusual activity in building projects, noted a week ago, is undiminished. Notable among new developments is the announcement that a 42-story home will be erected for the Chicago Civic Opera. Rail purchases totaled over 25,000 tons, of which 15,000 tons was ordered by the Pere Marquette. The Rock Island will buy 50,000 tons. Fresh car inquiry includes 2000 refrigerator cars, 500 automobile and 500 hopper car bodies. The budget of the Chicago, Rock Island & Pacific provides $6,500,000 for new equipment and the number of cars that may be purchased by the Illinois Central is now placed at 4000.

Pig Iron.—First quarter buying in December and the first half of January has exceeded 300,000 tons. This movement is well sustained and interest in second quarter requirements is on the increase. Of special interest is the greater activity both in contracting by and in shipments to the malleable foundries. The Mayville furnace, well supplied with a large stock of iron on the ground, was blown out Tuesday, leaving two Federal, two Iroquois and the Zenith furnace the only active merchant stacks in this district. Scattered sales of charcoal iron are being made at $24, furnaces, and less is heard of cuts in prices for purposes of liquidating stocks. Foundry iron prices are strong at $18.50, f.o.b. local furnace. Producers have oversold output at present rate, but furnace stocks are large and so will forestall blowing in additional stacks in the immediate future.

Prices per gross ton at Chicago:

Northern No. 2 foundry, sil. 1.75 to 2.25	$18.50
N'th'n No. 1 fdy., sil. 2.25 to 2.75	19.00
Malleable, not over 2.25 sil.	18.50
High phosphorus	18.50
Lake Superior charcoal, averaging sil. 1.50	27.04
Southern No. 2 fdy. (all rail)	22.01
Southern No. 2 (barge and rail)	20.18
Low phos., sil. 1 to 2 per cent, copper free	$28.50 to 29.00
Silvery, sil. 8 per cent	29.79
Bessemer ferrosilicon, 14 to 15 per cent	46.79

Prices are delivered consumers' yards except on Northern foundry, high phosphorus and malleable which are f.o.b. local furnace, not including an average switching charge of 61c. per gross ton.

Ferroalloys.—Buying of these commodities is quiet and prices are steady. Specifications are of good size and in some instances shipping schedules have been exceeded.

Prices delivered Chicago: 80 per cent ferromanganese, $107.56; 50 per cent ferrosilicon, $83.50 to $87.50; spiegeleisen, 19 to 21 per cent, $38.76 to $39.76.

Plates.—Specifications for steel from car builders are now beginning to take a prominent place in this market. In the week 15,000 tons have been scheduled for rolling and inquiries as to deliveries indicate that heavier requirements will be needed at an early date. The railroad equipment market from the viewpoint of large inquiries and purchases is dull, current business being confined to miscellaneous small lots from widely scattered sources. About 2000 tons of plates will be required for a high line syphon at Takoma, Wash., and definite inquiry has come from Louisiana for 2000 tons of oil tankage plates. An oil producer in western Texas has closed for 3000 tons of plates for tank construction, and several new projects are in the making in that territory. The last two weeks have brought about a material improvement in the position of local plate mills. Miscellaneous demand is holding steady and at the same time orders from fabricators and car builders have piled up so that deliveries in certain sizes of sheared plates are now from two to three weeks and some universal mill products cannot be had in that time. Plate mills are engaged at close to 70 per cent of capacity.

Mill prices on plates per lb.: 1.90c., base, Chicago.

Structural Material.—This week is outstanding in structural awards. In Chicago close to 13,000 tons was placed, including 4500 tons for the first four floors of the Woolworth Building, 3200 tons for an apartment building, 3000 tons for an office building and 1700 tons for a lift bridge. Unusual activity prevails among architects and engineers, who, in an effort to rush the placing of steel contracts, are submitting line drawings for estimates. Although prices for fabricated steel were no higher on recent lettings, there is a wider spread between the high and low bids, with average figures measurably higher than at the turn of the year. Highway bridge work gives further promise in two new inquiries calling for a total of 2700 tons.

Mill prices on plain material per lb.: 1.90c., base, Chicago.

Reinforcing Bars.—Awards are more numerous with rail steel bar producers taking the bulk of going business at prices that range 1.80c. to 1.85c., Chicago Heights mills. Henry Ericsson, a local contractor, will build the Campbell Soup Co.'s Chicago plant, for which 3000 tons of bars will be required. A sale of 400 tons of billet steel bars gives further proof that prices for round tonnages are not being held at the level which the trade had hoped to maintain. Warehouse quotations range from 2.25c. to 2.75c. New projects are numerous and estimators are well engaged. Warehouse shipments average 55 per cent of capacity. New awards and recent projects are shown on page 243.

Bolts, Nuts and Rivets.—Specifications for these commodities are heavier because of the larger requirements by railroads and the automotive industry.

Rails and Track Supplies.—Two railroads with terminals in Chicago have purchased 10,000 tons of standard-section rails. Fresh inquiry has come out in the last few days and the total now before Western mills is not less than 75,000 tons. Rail mill output is a shade over 80 per cent of capacity. Scattered orders for track fastenings total 10,000 tons. Inquiry is brisk and more than offsets current shipments. Tie plate production has been stepped up to 75 per cent of capacity and angle bar output is at 60 per cent. Taking the Middle West as a whole, orders for light rails are small, but in the week a sharp demand has come from the southern Illinois coal mining district. A few scattered sales of iron tie plates have been made, but inquiry is dull and does not indicate an active market in the immediate future.

Prices f.o.b. mill, per gross ton: Standard-section open-hearth and Bessemer rails, $43; light rails, rolled from billets, $36. *Per Lb.:* Standard railroad spikes, 2.80c.; track bolts with square nuts, 3.80c.; steel tie plates, 2.25c.; angle bars, 2.75c.

Wire Products.—Specifications from the jobbing trade are smaller as distributers find that a further expansion of stocks is not warranted at this time. New orders are split about even between those for immediate delivery and shipments for the future. Business is recovering in the flood areas of the Mississippi River Valley, notably in and around Memphis, Tenn. Distribution of wire products is in fair volume in the Southwest, where the spring demand will soon be felt, and in the Middle West, with the exception of portions of the Missouri River Valley. Orders from the far Northwest are numerous, considering the time of the year, but business is dull in the territory surrounding Minneapolis. Any lessening in the rate of shipments to jobbers is offset by the increased requirements of the manufacturing trade. As a general rule, prices are steady at 2.45c., Chicago, for plain wire and 2.60c. for nails, but cutting in the latter commodity has not been wholly eliminated from the nearby market, and at St. Louis concessions in prices have been made in a few instances on wire.

Bars.—Automobile producers and accessory manufacturers have taken their full quotas for the first half of January and they are now arranging shipping schedules for February. Indications are that requirements in February will well overbalance those of January. The demand for mild steel bars is such that local mill capacity is engaged at 85 per cent of capacity, about four points above the current rate of ingot output. Prices are firmly established at 1.90c., Chicago. Sales of iron bars are of fair size at 1.90c., Chicago. Specifications, however, are light. Alloy steel bar specifications are the heaviest in many weeks and local mills are operating at 75 to 80 per cent of rated output. Prices are steady. The rail steel bar market is quiet. Sales are confined to small lots and specifications are light. Both Chicago Heights mills continue to operate on a double turn basis, but at reduced hours per shift. Prices, except for hard steel bars used for concrete reinforcement, are stronger. Average orders are being taken at 1.80c., Chicago Heights mills, and smaller lots command 1.85c.

Mill prices per lb.: Soft steel bars, 1.90c., base, Chicago; common bar iron, 1.90c., base, Chicago; rail steel bars, 1.80c., base, Chicago Heights mill.

Sheets.—The size of order books has little bearing on the immediate requirements of users and local producers are having trouble in scheduling hot mills. Output is close to 75 per cent of capacity and this rate is difficult to maintain in view of the character of specifications received from day to day. Producers look for some relief when weather favorable to outdoor construction prevails in the near South and in the Southwest.

Base prices per lb., delivered from mill in Chicago: No. 24 black, 3.05c.; No. 24 galvanized, 3.90c.; No. 10 blue annealed, 2.25c. to 2.35c. Delivered prices at other Western points are equal to the freight from Gary plus the mill prices, which are 5c. per 100 lb. lower than the Chicago delivered prices.

Coke.—By-product foundry coke is in greater demand and prices are steady. Core oven heating coke is in fair demand but prices are weak, common quotations ranging from $7 to $7.50, delivered.

Cast Iron Pipe.—The trend in cast iron pipe prices is downward, as shown by recent quotations at Milwaukee and at Jackson, Mich. The National Cast Iron Pipe Co. was low bidder on 5000 tons of 6-in. to 16-in. pipe for Milwaukee at $25.85, Birmingham, or $34.35, delivered. At Jackson 110 tons of 6-in. class B pipe brought out a low bid of $26.70, Birmingham, or $34.65, delivered. It is said that Minneapolis will soon come into the market for a round tonnage, and Osseo, Wis., will close bids Jan. 27 on 12,000 ft. of 6-in. and 1000 ft. of 8-in. pipe. The American Cast Iron Pipe Co. is low bidder on the total tonnage asked by Portsmouth, Ohio, but it is reported that figures were taken three ways and that the award may be split. Two contractors near Chicago have placed large orders for immediate delivery, but for use in the spring. This market is moderately active in small tonnages, but this support comes principally from public utilities. Pipe foundries report that deliveries are extending and that the average is about three weeks for a spread of sizes.

Prices per net ton, delivered Chicago: Water pipe, 6-in. and over, $34.20 to $36.20; 4-in., $38.20 to $40.20; Class A and gas pipe, $4 extra.

Warehouse Prices, f.o.b. Chicago

	Base per Lb.
Plates and structural shapes	3.10c.
Soft steel bars	3.00c.
Reinforcing bars, billet steel	2.25c. to 2.75c.
Cold-finished steel bars and shafting—	
Rounds and hexagons	3.60c.
Flats and squares	4.10c.
Bands	3.65c.
Hoops	4.15c.
Black sheets (No. 24)	3.95c.
Galvanized sheets (No. 24)	4.80c.
Blue annealed sheets (No. 10)	3.50c.
Spikes, standard railroad	3.55c.
Track bolts	4.55c.
Rivets, structural	3.60c.
Rivets, boiler	3.60c.
	Per Cent Off List
Machine bolts	60
Carriage bolts	60
Coach or lag screws	60
Hot-pressed nuts, squares, tapped or blank	60
Hot-pressed nuts, hexagons, tapped or blank	60
No. 8 black annealed wire, per 100 lb.	$3.20
Common wire nails, base per keg	$2.90 to 3.00
Cement coated nails, base per keg	2.90 to 3.00

Old Material.—Sales of heavy melting steel aggregating 35,000 tons to three local mills have brought to an end, at least temporarily, the upward trend in prices in the Chicago scrap market. Prices in these transactions ranged from $13 to $13.25. Dealers, in an effort to cover, immediately cut offered prices to $12.50 to $12.75, and they have had little difficulty in getting the tonnages required. A weak spot also developed in another direction, namely, in cast iron borings. Closing down of the last Mayville stack has cut off that channel and is diverting a flow of borings from Milwaukee to Chicago. Producers of this grade suddenly reached the conclusion that this is the time to unload. These factors, combined with others, suddenly converted the local market from one in which there existed a scarcity of borings to one of which there is a surplus.

Prices delivered consumers' yards, Chicago:

Per Gross Ton	
Basic Open-Hearth Grades:	
Heavy melting steel	$12.50 to $13.00
Shoveling steel	12.50 to 13.00
Frogs, switches and guards, cut apart, and miscellaneous rails	14.25 to 14.75
Hydraulic compressed sheets	10.75 to 11.25
Drop forge flashings	9.75 to 10.25
Forged, cast and rolled steel carwheels	15.50 to 16.00
Railroad tires, charging box size	16.25 to 16.75
Railroad leaf springs, cut apart	16.25 to 16.75
Acid Open-Hearth Grades:	
Steel couplers and knuckles	15.00 to 15.50
Coil springs	16.50 to 17.00
Electric Furnace Grades:	
Axle turnings	12.50 to 13.00
Low phosphorus punchings	14.25 to 14.75
Low phosphorus plate, 12 in. and under	13.50 to 14.00
Blast Furnace Grades:	
Axle turnings	10.75 to 11.25
Cast iron borings	10.50 to 11.00
Short shoveling turnings	10.50 to 11.00
Machine shop turnings	7.75 to 8.25
Rolling Mill Grades:	
Iron rails	13.50 to 14.00
Rerolling rails	15.00 to 15.50
Cupola Grades:	
Steel rails less than 3 ft.	15.25 to 15.75
Angle bars, steel	14.50 to 15.00
Cast iron carwheels	14.00 to 14.50
Malleable Grades:	
Railroad	13.75 to 14.25
Agricultural	12.50 to 13.00
Miscellaneous:	
*Relaying rails, 56 to 60 lb.	23.00 to 25.00
*Relaying rails, 65 lb. and heavier	26.00 to 31.00
Per Net Ton	
Rolling Mill Grades:	
Iron angle and splice bars	14.00 to 14.50
Iron arch bars and transoms	18.75 to 19.25
Iron car axles	21.50 to 22.00
Steel car axles	16.00 to 16.50
No. 1 railroad wrought	11.00 to 11.50
No. 2 railroad wrought	11.00 to 11.50
No. 1 busheling	9.50 to 10.00
No. 2 busheling	4.50 to 5.00
Locomotive tires, smooth	12.50 to 13.00
Pipes and flues	8.00 to 8.50
Cupola Grades:	
No. 1 machinery cast	14.50 to 15.00
No. 1 railroad cast	13.50 to 14.00
No. 1 agricultural cast	13.50 to 14.00
Stove plate	12.00 to 12.50
Grate bars	11.50 to 12.00
Brake shoes	11.75 to 12.25

*Relaying rails, including angle bars to match, are quoted f.o.b. dealers' yards.

Acquires Hamilton Bridge Works

The Hamilton Bridge Works, Ltd., Hamilton, Ont., has been acquired by James Playfair, president of the Canadian Vickers Co., and his associates, F. M. Ross and Drury & Co., according to an announcement by Ian Hendrie, vice-president of the Hamilton company. He stated that the change of control would not likely result in disruption of the present staff, and that the project would probably be financed by a public bond issue. The company was founded in 1874 and reorganized in 1925.

New York

Pig Iron Sales About 10,000 Tons—Steel Trade Quiet

NEW YORK, Jan. 17.—Sales of pig iron by local brokers during the week totaled nearly 10,000 tons, as compared with only 3500 tons in the previous week. While melters are still cautious, limiting their purchases to relatively small tonnages, they are commencing to see more business ahead and are taking a proportionately keener interest in the iron market. Some foundries that bought only recently are adding to their purchases, and others, which have been out of the market for from four to six months, are again issuing inquiries. Demand is principally for shipment during the current quarter, although a few inquiries for next quarter have appeared. The New York Air Brake Co., for example, is in the market for 1000 tons of malleable for second quarter delivery at Watertown, N. Y., and a Montreal company with American affiliations is asking for prices on 1000 tons of iron for shipment by boat after the reopening of navigation. The Thatcher Co. has bought against an inquiry for 500 tons of foundry for delivery at Garwood, N. J. The Delaware, Lackawana & Western Railroad is in the market for 100 tons of No. 2 plain for shipment to Scranton, Pa., and the Baltimore & Ohio Railroad wants a similar tonnage for Baltimore delivery. The Worthington Pump & Machinery Corporation has finally closed against its inquiry for 400 tons for Holyoke, Mass., but is still in the market for 90 tons of Bessemer iron for shipment to Harrison, N. J. Foreign low phosphorus is stronger, now being quoted at $24, duty paid, port of entry. Eastern Pennsylvania foundry iron has been sold within the week at $19, base furnace, although producers are making a stronger effort to maintain a minimum price of $19.50. Buffalo foundry iron still ranges from $16.50 to $17, base furnace.

Prices per gross ton, delivered New York district:

Buffalo No. 2 fdy., sil. 1.75 to 2.25	$21.41 to $21.91
East. Pa. No. 2 fdy., sil. 1.75 to 2.25	20.39 to 21.52
East. Pa. No. 2 fdy., sil. 2.25 to 2.75	20.89 to 22.02
East. Pa. No. 1X fdy., sil. 2.75 to 3.25	21.39 to 22.52

Freight rates: $4.91 from Buffalo, $1.39 to $2.52 from eastern Pennsylvania.

Ferroalloys.—There has been practically no inquiry thus far this year for ferromanganese, quotations for which are firm at $100 for seaboard or furnace. There has been a little business done in spiegeleisen and there are a few inquiries before the market. Prices are firm at $31 to $32 for the 19 to 21 per cent alloy.

Cast Iron Pipe.—Prices have developed a slight weakness. A Southern producer of gas and water pipe is reported to have quoted under $28 per ton, base Birmingham, but most makers are maintaining $28, base, as a minimum. There is some private purchasing of water pipe, but mostly in small lots.

Prices per net ton, delivered New York: Water pipe 6-in. and larger, $37.25 to $38.25; 4-in. and 5-in., $42.25 to $43.25; 3-in., $52.25 to $53.25; Class A and gas pipe, $4 to $5 extra.

Reinforcing Bars.—The advance of the mill price on reinforcing bars, to 1.90c., Pittsburgh, announced by distributers in this territory several days ago, was responsible for the placing in the last week of 2000 tons for subway work. Igoe Brothers, Concrete Steel Co. and McClintic-Marshall Co. shared in this award. Covering for these jobs is said to be the last which will be allowed at the old price, and new work is being quoted at a basis of 1.90c., Pittsburgh. There has been no change in the New York or Youngstown warehouse prices.

Warehouse Business.—There has been a slight decline in purchasing. Black and galvanized sheets continue to sell at silght concessions in New York, but in New Jersey the base prices of 4.20c. per lb. for black and 4.95c. per lb. for galvanized are fairly well maintained. Occasionally blue annealed sheets are shaded 5c. to 10c. per 100 lb.

Coke.—Prices are unchanged at about $4 per net ton, Connellsville, for standard foundry and at $2.75 to $3 per ton, Connellsville, for standard furnace grade. Purchasing is light. Delivered prices on Connellsville foundry coke are: To northern New Jersey, $8.03; to New York or Brooklyn, $8.79; to Newark or Jersey City, $7.91. By-product foundry coke is quoted at $9 to $9.40 per net ton, delivered Newark or Jersey City.

Finished Steel.—Not much new business has been placed during the week, but specifications against contracts continue to come to district sales offices at a fairly good rate and consumers are taking shipments

Warehouse Prices, f.o.b. New York

	Base per Lb.
Plates and structural shapes	3.34c.
Soft steel bars and small shapes	3.24c.
Iron bars	3.24c.
Iron bars, Swedish charcoal	7.00c. to 7.25c.
Cold-finished shafting and screw stock—	
Rounds and hexagons	3.30c.
Flats and squares	3.80c.
Cold-rolled strip, soft and quarter hard,	6.00c. to 6.25c.
Hoops	4.49c.

No. 26	5.10c. to 5.20c.
No. 28*	5.35c. to 5.45c.
No. 30	5.75c. to 5.85c.

*No. 28 and lighter, 36 in. wide, 20c. higher per 100 lb.

against commitments in a way that indicates a generally higher level of manufacturing operations than prevailed in December. Mill operations in the East on plates and shapes have improved noticeably this month, and in structural steel there are sufficient projects under consideration to produce a hopeful feeling that a continuing improvement will develop. Among new structural projects is 5000 tons for the Lefcourt Building at Fifth Avenue and Forty-third Street, while the largest award locally is 2900 tons for subway work. December awards of fabricated steel, not including subways, bridges and similar general construction work, as reported to the Structural Steel Board of Trade of New York, totaled 36,900 tons for the metropolitan area, compared with 37,000 tons in November, 1927, and 34,000 tons in December, 1926. The total for 1927 in the New York district was 512,431 tons, compared with 374,476 tons in 1926, a gain of more than 37 per cent. Prices on plates, shapes and bars are unchanged, while sheet quotations are working toward 2.90c. on black and 3.75c. on galvanized, although these prices have not yet obtained on all transactions. Blue annealed sheets are firm at 2.10c. for widths under 40 in.

Cold rolled strip steel manufacturers have announced an advance in price of $3 a ton, effective Jan. 25, making the new quotations 2.90c. per lb., Pittsburgh or Cleveland, for lots of three tons or more and 3.15c. for less than three tons. The Worcester, Mass., mill will quote, as usual, 15c. per 100 lb. above these prices at mill.

Mill prices per lb., delivered New York: Soft steel bars, 2.14c.; plates, 2.12½c.; structural shapes, 2.09½c.; bar iron, 2.14c.

Old Material.—Prices on all grades of scrap are firm, but show no tendency to advance. The market is quiet. No. 1 heavy melting steel is unchanged at $13.50 per ton, delivered to Bethlehem, Coatesville, Conshohocken, Pa., or Claymont, Del. Yard grade is being purchased by brokers at $11 per ton, delivered Harrisburg, Pottsville or Phoenixville, Pa.

Dealers' buying prices per gross ton, New York:

No. 1 heavy melting steel	$10.00 to $10.85
Heavy melting steel (yard)	6.75 to 7.25
No. 1 heavy breakable cast	11.25 to 12.00
Stove plate (steel works)	8.75 to 9.00
Locomotive grate bars	8.25 to 8.50
Machine shop turnings	6.50 to 7.50
Short shoveling turnings	6.50 to 7.50
Cast borings (blast furnace or steel works)	6.75 to 7.25
Mixed borings and turnings	6.50 to 7.50
Steel car axles	17.00 to 17.50
Iron car axles	23.75 to 24.75
Iron and steel pipe (1 in. diam., not under 2 ft. long)	8.75 to 9.25
Forge fire	6.50 to 7.00
No. 1 railroad wrought	10.50 to 11.00
No. 1 yard wrought, long	9.00 to 9.50
Rails for rolling	10.50 to 11.00
Cast iron carwheels	11.25 to 11.75
Stove plate (foundry)	8.75 to 9.00
Malleable cast (railroad)	10.00 to 10.50
Cast borings (chemical)	11.00 to 12.00

Prices per gross ton, delivered local foundries:

No. 1 machinery cast	$13.50 to $14.00
No. 1 heavy cast (columns, building materials, etc.), cupola size	11.50 to 12.00
No. 2 cast (radiators, cast boilers, etc.)	11.00 to 11.50

Warehouse Prices, f.o.b. Cleveland

	Base per Lb.
Plates and structural shapes	3.00c.
Soft steel bars	3.00c.
Reinforcing steel bars	2.25c. to 2.75c.
Cold-finished rounds and hexagons	3.65c.
Cold-finished flats and squares	4.15c.
Hoops and bands	3.65c.
Cold-finished strip	*5.95c.
Black sheets (No. 24)	3.75c.
Galvanized sheets (No. 24)	4.40c. to 4.50c.
Blue annealed sheets (No. 10)	3.25c.
No. 9 annealed wire, per 100 lb.	$2.90
No. 9 galvanized wire, per 100 lb.	3.35
Common wire nails, base per keg	2.90

*Net base, including boxing and cutting to length.

Cleveland

New Steel Business Exceeds Expectations—Pig Iron Active

CLEVELAND, Jan. 17.—Consumers are placing a fair amount of small-lot orders for steel bars, plates and structural material at 1.80c., Pittsburgh. Some of this business is coming from buyers who will need more steel than they covered for in their December specifications and some from consumers who, following their hand-to-mouth buying policy, did not take advantage of the lower prices prevailing last month.

The volume of new business exceeds expectations in view of the fact that many buyers have enough material coming in against December specifications to last them for several weeks. The 1.80c., Pittsburgh, price quoted by outside mills appears to be holding firmly, although it has not yet been tested by round lot sales to fabricators and other large consumers. Local mills continue to quote steel bars at 1.80c., Cleveland, but there are still reports that this is being shaded $1 a ton.

Automobile companies are specifying liberally for steel bars, sheets and strip steel, but they can obtain good deliveries and are not ordering very far ahead. A heavy production of motor cars appears to be assured for at least the first quarter, as a large output will be required to stock dealers with new models. The real test of new prices on sheets and hot-rolled strip steel will not come before March or April, as motor car manufacturers and parts makers are covered for the quarter at the old prices.

The outstanding inquiry in the structural field is for 20,000 tons for commercial buildings in connection with the Cleveland Union Terminals project. Several other good sized lots are expected to be required for this project during the year.

Pig Iron.—Sales by Cleveland interests during the week totaled over 25,000 tons, or about the same as the previous week. There is more activity in Michigan than in other sections. The business came mostly from small foundries, as many of the larger consumers had previously covered for first quarter. Producers as a rule have good order books for the quarter, and a somewhat firmer stand is being taken on prices. While $17 is the common Lake furnace quotation, for foundry and malleable iron, $16.50 has not disappeared in competitive sections in southern Ohio and Indiana, and silicon differentials are still being waived or split. One producer has advanced its price in Michigan to $18. Shipping orders show considerable gain and some furnaces expect to ship more iron than they make this month. Foundries in the automotive industry have increased production, although some are not yet operating at full capacity. Heavy specifications are coming from this source.

Prices per gross ton at Cleveland:

N'th'n No. 2 fdy., sil. 1.75 to 2.25	$18.50
Southern fdy., sil. 1.75 to 2.25	22.00
Malleable	18.50
Ohio silvery, 8 per cent	28.00
Basic, Valley furnace	17.00
Standard low phos., Valley furnace	$26.50 to 27.00

Prices, except on basic and low phosphorus, are delivered Cleveland. Freight rates: 50c. from local furnaces; $3 from Jackson, Ohio; $6 from Birmingham.

Coke.—One maker of premium foundry coke in the Connellsville district has reduced its price 25c. a ton to 5.10, at which it is taking contracts for first quarter. Other grades are unchanged, with $3.75 a minimum. Heating coke ranges from $2.75 to $3. The market is inactive.

Alloy Steel.—The speeding up of the automotive industry has resulted in a good demand for alloy steel bars. Forge shops in this territory are well filled with automotive work and considerable business is coming from that source. Sales during the week included a 3500-ton lot placed by a Cleveland drop forge plant. Regular quotations are holding well.

Bolts, Nuts and Rivets.—Bolt and nut makers are getting good specifications from the automotive industry, railroads and jobbers. There is practically no new business, as nearly all buyers are under contract. Prices are firm. While rivet specifications have improved somewhat, they are still rather light.

Rails.—The Nickel Plate Railroad has purchased 11,500 tons of rails for its 1928 requirements and has taken an option on 7000 tons additional, the total being about the amount that it placed a year ago. One-half the tonnage was placed with Steel Corporation mills and the remainder equally divided between the Bethlehem Steel Co. and the Inland Steel Co.

Semi-Finished Steel.—Most consumers are covered for early requirements and specifications are good. There is a range in local prices on sheet bars, depending on location of consumer's plant, some buyers getting a concession of $1 or more a ton from the $34 price that prevails in the Youngstown district.

Sheets.—The automotive industry is now taking a large tonnage of sheets and specifications from other consumers are fairly good. However, sales are light, as most buyers are under first quarter contract at the old prices. While 2.90c., Pittsburgh, for black and 2.10c. for blue annealed sheets are the general quotations, concessions of $1 to $2 a ton are still appearing in these grades. Galvanized sheets are being offered at 3.65c., Pittsburgh, and a fair number of sales are being made for February and March shipment. Automobile body sheets are firm at 4c., Pittsburgh.

Strip Steel.—Specifications for hot rolled strip from the automotive industry are heavy, but most consumers are covered at lower prices than are now asked, and not much test of the present prices is expected before March. The common quotations are 1.85c., Pittsburgh, for material 6 to 12 in. wide and 2.05c. for under 6 in. For 12 in. and wider material, mills quote the plate base on 12 gage and heavier and a 2.10c. blue annealed base for lighter than 12 gage. Cold rolled strip is in good demand. An advance to 2.90c., Cleveland, for three tons and over has been announced and will become effective Jan. 25.

Fluorspar.—Several small-lot sales of gravel fluorspar are reported at $15, mines, but on a large tonnage a price of $14.50 would be available.

Reinforcing Bars.—An inquiry has come out for 745 tons for the Whitehouse Crossing grade elimination work, Cleveland. An inquiry from the Cleveland Union Terminals Co., Cleveland, for 1600 tons is still pending. Prices on new billet steel bars are irregular. Rail steel bars are unchanged at 1.65c., mill.

Warehouse Business.—Sales improved somewhat the past week, probably because of completion of inventories. Regular prices are being well maintained. Galvanized sheets are in good demand.

Old Material.—Scrap is moving better than for some time, mostly in steel making grades, against contracts placed some time ago. A Cleveland mill, which because of its exacting specifications pays higher than the going common market for scrap, has purchased a moderate tonnage of heavy melting steel at $14.75. Because of expectations by producers and dealers of a better demand and higher prices after the first of the year, scrap did not come out freely for a time, and dealers paid $14.10 for heavy melting steel a few days ago, but the market now shows less firmness. The supply has become more plentiful and $14 is again the ruling quotation. Small lots of blast furnace scrap are moving at $10.75. Efforts are being made in the Youngstown district to secure a reduction of the present freight rate of $3.53 on scrap from Detroit to that district, and a meeting sponsored by the Youngstown Chamber of Commerce was held in that city today to consider the matter. Much of the scrap that formerly went from Detroit to the Youngstown district was diverted to Buffalo last year being shipped by water, and if Youngstown mills can secure a reduction in the rail rate they will be in a better position to compete with Buffalo for the Detroit scrap during the lake shipping season.

Prices per gross ton, delivered consumers' yards:

Basic Open-Hearth Grades	
No. 1 heavy melting steel	$13.75 to $14.00
No. 2 heavy melting steel	13.25 to 13.50
Compressed sheet steel	12.75 to 13.00
Light bundled sheet stampings	11.50 to 11.75
Drop forge flashings	12.50 to 13.00
Machine shop turnings	9.00 to 9.25
No. 1 railroad wrought	11.50 to 12.00
No. 2 railroad wrought	13.50 to 14.00
No. 1 busheling	11.50 to 12.00
Pipes and flues	9.00 to 9.50
Steel axle turnings	12.50 to 13.00
Acid Open-Hearth Grades	
Low phosphorus forging crops	16.50 to 17.00
Low phosphorus, billet, bloom and slab crops	17.00 to 17.50
Low phosphorus sheet bar crops	16.50 to 17.00
Low phosphorus plate scrap	16.00 to 16.50
Blast Furnace Grades	
Cast iron borings	10.25 to 10.75
Mixed borings and short turnings	10.25 to 10.75
No. 2 busheling	10.25 to 10.75
Cupola Grades	
No. 1 cast	16.50 to 17.00
Railroad grate bars	11.00 to 12.00
Stove plate	12.00 to 12.50
Rails under 3 ft.	18.00 to 18.50
Miscellaneous	
Railroad malleable	15.00 to 15.50
Rails for rolling	16.25 to 16.50

Warehouse Prices, f.o.b. Philadelphia

	Base per Lb.
Plates, ¼-in. and heavier	2.50c. to 2.60c.
Plates, 3/16-in.	2.80c. to 3.00c.
Structural shapes	2.50c. to 2.60c.
Soft steel bars, small shapes and iron bars (except bands)	2.50c. to 2.60c.
Round-edge iron	3.50c.
Round-edge steel, iron finished, 1½ x 1½ in.	3.50c.
Round-edge steel, planished	4.30c.
Reinforcing steel bars, square, twisted and deformed	2.50c. to 3.00c.
Cold-finished steel, rounds and hexagons	3.25c. to 5.25c.
Cold-finished steel, squares and flats	3.75c. to 5.75c.
Steel hoops	3.85c. to 4.15c.
Steel bands, No. 12 gage to 3/16-in., inclusive	3.60c. to 3.90c.
Spring steel	5.00c.
Black sheets (No. 24)	4.25c.
Galvanized sheets (No. 24)	5.10c.
Blue annealed sheets (No. 10)	3.15c.
Diamond pattern floor plates—	
¼-in.	5.30c.
3/16-in.	5.50c.
Rails	3.20c.
Swedish iron bars	6.60c.

Philadelphia

Pig Iron Advance Brings Out Orders—Railroads Inquire For Barges

PHILADELPHIA, Jan. 17.—Pig iron and steel markets are moderately active, stimulated by a continued demand for small tonnages. Railroad purchasing seems to provide the stimulus for much of the present activity. Steel casting plants are operating on small orders from railroads and shipyards have submitted bids on inquiries for car floats, barges, tugs and lighters from the Pennsylvania and New York Central railroads. The Reading Co. is inquiring for 1000 kegs of railroad spikes.

Bars.—There is a fair volume of purchasing, with orders ranging up to 75 and 100 tons in some instances. The basis of 1.80c. per lb., Pittsburgh, or 2.12c. per lb., delivered Philadelphia, is well maintained. A moderate demand for reinforcing bars is developing.

Shapes.—Mills are quoting 1.95c. per lb., base, Bethlehem, and 1.92½c. per lb., base, Pottsville, or 2.07c. to 2.08c. per lb., delivered Philadelphia. Prices are being well maintained, but there are outstanding contracts at lower figures. Some large business is in prospect including the Newark Bay and the Tacony-Palmyra bridges. Fifteen barges inquired for by the New York Central Railroad will require a sizable tonnage of 12-in. channels.

Pig Iron.—The advance to $19.50, base, for foundry iron, reported last week, is evidently being maintained by eastern Pennsylvania producers and some small tonnages have been booked at the new level. A producer of basic iron has advanced the price to $19, base furnace, but no sales are reported. A recent inquiry from a steel castings plant calls for from 3000 to 4000 tons of low phosphorus iron. The Federal Steel Foundry Co., Chester, Pa., recently closed on about 300 tons of this grade. Purchases of foundry iron have included about 1000 tons by the American Engineering Co., Philadelphia, about 1000 tons by the Hajoca Corporation, Philadelphia, and 300 tons by the Consolidated

Machine Tool Co., Wilmington, Del. The Baldwin Locomotive Works is reported to have placed 4000 tons of floor and cylinder iron with two makers.

Prices per gross ton at Philadelphia:

East. Pa. No. 2 plain, 1.75 to 2.25 sil.	$20.26
East. Pa. No. 2X, 2.25 to 2.75 sil.	20.76
East. Pa. No. 1X	21.26
Basic (delivered eastern Pa.)	$19.50 to 20.00
Gray forge	19.75 to 20.25
Malleable	21.00 to 21.50
Standard low phos. (f.o.b. New York State furnace)	23.00 to 24.00
Copper bearing low phos. (f.o.b. furnace)	23.50 to 24.00
Virginia No. 2 plain, 1.75 to 2.25 sil.	24.54 to 25.04
Virginia No. 2X, 2.25 to 2.75 sil.	25.04 to 25.54

Prices, except as specified otherwise, are delivered Philadelphia. Freight rates: 76c. to $1.64 from eastern Pennsylvania furnaces; $4.54 from Virginia furnaces.

Plates.—Prices are reported firm at 1.95c. per lb., base, Coatesville and Sparrows Point, or 2.05c. per lb., delivered Philadelphia. Bids have been opened by the Pennsylvania Railroad on six 330-ft. and six 250-ft. steel car floats, two steel tug boat hulls and one steam lighter hull. Buying by oil companies is reported to be improving.

Sheets.—Buying is fair with prices still ranging from 2.75c. to 2.90c. per lb., base Pittsburgh, on black and 3.75c. to 3.85c. per lb., base, on galvanized. Blue annealed sheets are quoted on a basis of 2.10c. per lb., on sizes narrower than 40 in. and at 2.20c. per lb., base, Pittsburgh, for wider than 40 in.

Warehouse Business.—There has been slightly less activity in the past week and prices still show a tendency to softness. Based on recent sales from stock, sheets are not quotable at more than 4.25c. per lb., base, for black, 5.10c. per lb., base, for galvanized and 3.15c. per lb., base, for blue annealed.

Ferromanganese.—Purchasing is small. The price is unchanged at $100 per ton, seaboard.

Imports.—In the week ended Jan. 14, a total of 9135 gross tons of manganese and chrome ore arrived at this port, of which 4945 tons was manganese ore from British West Africa, 2000 tons chrome ore from Portuguese Africa and 2190 tons chrome ore from Greece. A thousand tons of pig iron arrived from India and 25 tons of ferromanganese from Great Britain. Steel imports included 281 tons of shapes, 59 tons of bars, 33 tons of hoops and bands and 29 tons of steel ingots from Belgium, 33 tons of steel ingots from France and seven tons of steel scrap from Germany.

Old Material.—Purchasing is of small tonnages with occasional exceptions, such as the reported sale by a large dealer of 1000 tons of cast iron carwheels at $16.50 per ton, delivered eastern Pennsylvania. A small tonnage of couplers and knuckles is reported to have been closed by one dealer at $16.50 per ton, delivered. In general, the market shows but little change from the quietness of the past few months.

Prices per gross ton delivered consumers' yards, Philadelphia district:

No. 1 heavy melting steel	$13.50 to $14.00
Scrap T rails	13.00 to 13.50
No. 2 heavy melting steel	11.00 to 11.50
No. 1 railroad wrought	15.25 to 15.75
Bundled sheets (for steel works)	10.50 to 11.00
Machine shop turnings (for steel works)	11.00
Heavy axle turnings (or equivalent)	12.00 to 12.50
Cast borings (for steel works and rolling mill)	11.00
Heavy breakable cast (for steel works)	15.50 to 16.00
Railroad grate bars	12.50 to 13.00
Stove plate (for steel works)	12.50 to 13.00
No. 1 low phos., heavy, 0.04 per cent and under	18.00 to 18.50
Couplers and knuckles	16.00 to 16.50
Rolled steel wheels	15.50 to 16.00
No. 1 blast furnace scrap	10.00 to 10.50
Machine shop turnings (for rolling mill)	11.00 to 11.50
Wrought iron and soft steel pipes and tubes (new specifications)	13.00 to 13.50
Shafting	17.50 to 18.00
Steel axles	19.00 to 20.00
No. 1 forge fire	11.00 to 12.00
Steel rails for rolling	15.00 to 15.50
Cast iron carwheels	15.50 to 16.50
No. 1 cast	16.00 to 16.50
Cast borings (for chemical plant)	15.00 to 15.50

Third Arbitrator Appointed in Hudson Valley-Tutein Case

David A. Schulte, president Schulte Retail Stores Corporation, New York, has been appointed the third arbitrator in the case of E. Arthur Tutein, Inc., vs. the Hudson Valley Products Corporation, Troy, N. Y. The selection was made by Charles M. Schwab who, as president of the American Iron and Steel Institute, was asked to make the appointment following the failure of the arbitrators designated by the parties to the dispute to agree on a third.

The case had its inception in June, 1927, when the Hudson Valley company cancelled a contract with E. Arthur Tutein, Inc., for the exclusive sale of its products. Subsequently United States Senator Robert F. Wagner was appointed arbitrator for the Hudson Valley company, and Sherman L. Whipple, Boston, arbitrator for the Tutein company. The board of arbitration, now complete, has not yet selected a time for the commencement of hearings.

Continental Can Plans Purchase of United States Can Co.

The Continental Can Co., New York, is negotiating for the purchase of the United States Can Co., Norwood, Ohio. Directors of the latter company have approved the transaction and have called a meeting of stockholders for Jan. 21 to consider the offer made by the Continental company. If the deal is consummated, it will bring together the second and third largest manufacturers of cans in the United States. Assets of the United States Can Co. are estimated at $7,000,000 and plants are maintained at Norwood, Ohio; Chicago; St. Louis; Baltimore and Roanoke and Buchanan, Va.

The Continental company also has plans under advisement for the erection of a four-story plant, 140 x 160 ft., on West Thirty-fifth Street, Chicago. The site is adjacent to the proposed factory of the Campbell Soup Co., Camden, N. J.

Pig Iron Association to Discontinue Statistical Activities

The American Pig Iron Association has issued a statement announcing its intention of discontinuing its statistical activities. Reason for this action is attributed to the "closing down of a large number of the merchant furnaces in the country since 1920, and the further fact that many steel plants are engaged in the sale of merchant iron, making it impossible to collect dependable statistics of the production, sale and shipment of the product or procure any accurate knowledge of the stock on hand."

A meeting of the members of the association was held in Cleveland on Jan. 17 to determine its future policy and the disposition of its cash on hand. No statement was made at the close of the meeting.

Ask for 50 Per Cent Increase in Cast Pipe Duty

WASHINGTON, Jan. 17.—Formal application has been filed with the Tariff Commission by domestic producers of cast iron pipe for an increase of 50 per cent in the present 20 per cent import duty on that product. The growing volume of cast iron pipe imports, particularly from France, has created apprehension on the part of American producers. Total imports of cast iron pipe for the 11 months ended with November, 1927, were 78,657 gross tons, of which 61,002 tons came from France and 14,185 tons from Belgium. This compares with a total of 71,799 tons for the 11 months ended with November, 1926.

Of the French imports during the 11-month period of last year 35,428 tons came through Atlantic ports; 18,558 tons through Pacific ports and 7015 tons through Gulf ports. The imports from Belgium took a different movement, 12,119 tons coming through Pacific ports and only 2065 tons through Atlantic ports. For the 11 months of 1926 imports of French pipe totaled 48,861 tons and Belgian imports 18,386 tons.

San Francisco

Pipe Line to Take 14,000 Tons—2000 Cars Soon in Market

SAN FRANCISCO, Jan. 14 (*By Air Mail*).—Buying of steel products so far this year has shown a substantial improvement over the volume placed during the last two weeks of 1927, and the outlook is encouraging. The Pacific Fruit Express will shortly be in the market for 2000 refrigerator cars.

Building and construction activity on the Pacific Coast this year may exceed operations for 1927. Estimates of prospective construction work in San Francisco, based on plans now on the architects' boards, placed the total for the year at over $60,000,000, while estimates on the more important projects in Los Angeles and other southern California cities, show more than $65,000,000 worth of work in sight.

Pig Iron.—Sales and inquiries call only for small lots for prompt shipment. Prices are unchanged.

Prices per gross ton at San Francisco:

*Utah basic	$25.00 to $26.00
*Utah foundry, sil. 2.75 to 3.25	25.00 to 26.00
**Indian foundry, sil. 2.75 to 3.25	24.00 to 25.00
**German foundry, sil. 2.75 to 3.25	24.25

*Delivered San Francisco.
**Duty paid, f.o.b. cars San Francisco.

Shapes.—During the week seven awards of fabricated steel totaled 1160 tons. An award is expected next week on 6000 tons for an office building in San Francisco. Foreign shapes are about 1.60c., c.i.f., duty paid, while domestic material is firm at 2.35c., c.i.f. Coast ports.

Plates.—An inquiry of the Petroleum Securities Co., Los Angeles, for tanks for its new Richmond, Cal., plant involves from 700 to 2500 tons of plates. Plate prices are firm at 2.25c., c.i.f., this figure applying on large and small lots.

Bars.—The Pacific Fruit Express Co., San Francisco, has taken bids on 475 tons of merchant bars and bands and on 45 tons of plates and 105 tons of sheets. The Bethlehem Steel Co. obtained an additional 1500 tons for the Coyote Point bridge across San Francisco Bay, bringing the total to 10,000 tons.

Cast Iron Pipe.—Considerable activity is noted in the cast iron pipe market, and awards this week included 1510 tons of 4 to 14-in. class B pipe for Santa Clara, Cal., placed with J. Tobin, Oakland, Cal.; 401 tons of 2 to 10-in. class B pipe for the Los Angeles County Water Works District No. 10, booked by the United States Cast Iron Pipe & Foundry Co., and 153 tons of 6 and 10-in. class B pipe for the improvement of Main Street, San Diego, Cal., placed with the Butterfield Construction Co. of San Diego. The United States Cast Iron Pipe & Foundry Co. was low bidder on 2825 tons of 6 to 24-in. pipe for Portland, and probably will be awarded the contract for DeLavaud pipe. It was also low on 340 tons of 4 to 12-in. class D pipe for The Dalles, Ore. Bids were opened this week on 1246 tons of 2 to 12-in. class B pipe for Spokane, Wash., and on 125 tons of 4 to 10-in. class B for El Segundo, Cal. Chowchilla, Cal., will open bids on Jan. 20 for 188 tons of 4 to 8-in. class B pipe and San Diego, Cal., will take bids on Jan. 30 for 369 tons of 4 to 8 in. class B pipe for the improvement of streets in Paradise Hills. Prices remain around $35 a ton delivered on 6-in. and larger.

Steel Pipe.—The Petroleum Securities Co., Los Angeles, probably will award a contract shortly for 650 tons of 3½ to 16-in. plain-end line pipe for its new Richmond, Cal., plant. The General Petroleum Corporation, Los Angeles, has an inquiry out for 75 miles of 12 to 16-in. line pipe, and this company has decided to construct two 8-in. lines, each 90 miles long, from the Rincon oil fields to its Los Angeles refinery, involving about 14,000 tons.

Track Materials.—The Southern Pacific Co. has not yet taken action on its inquiry for 3120 tons of track spikes and bolts, bids on which went in Dec. 26. It opened bids this week on 880,800 tie plates, about 4500 tons.

Coke.—Sales and inquiries are confined to small lots. Prices are unchanged.

Warehouse Prices, f.o.b. San Francisco

	Base per Lb.
Plates and structural shapes	3.15c.
Soft steel bars	3.15c.
Small angles, $\frac{3}{16}$-in. and over	3.15c.
Small angles, under $\frac{3}{16}$-in	3.55c.
Small channels and tees, ¾-in. to 2¾-in.	3.75c.
Spring steel, ¼-in. and thicker	5.00c.
Black sheets (No. 24)	4.80c.
Blue annealed sheets (No. 10)	3.75c.
Galvanized sheets (No. 24)	5.35c.
Structural rivets, ½-in. and larger	5.65c.
Common wire nails, base per keg	$3.35
Cement coated nails, 100-lb. keg	3.35

Birmingham

Pig Iron Shipments Increase—Steel Trade Slowly Improving

BIRMINGHAM, Jan. 17.—The pig iron market during the past week or 10 days has not been very active. Some tonnage in small amounts has been coming in, but no general movement has developed. This is due partly to December buying, to the last quarter carry-over, and to the slow resumption of normal operations. Quotations remain on a $16 base. Shipments last week were greatly improved as compared with other weeks since mid-December.

Prices per gross ton, f.o.b. Birmingham district furnaces:

No. 2 foundry, 1.75 to 2.25 sil	$16.00
No. 1 foundry, 2.25 to 2.75 sil	16.50
Basic	16.00

Finished Steel.—Conditions continue gradually to improve. Inquiries indicate satisfactory prospects. No tonnage of any consequence was booked by structural steel fabricators during the week. Prices are unchanged.

Cast Iron Pipe.—Two pressure pipe manufacturers report that inquiries are fair; another reports that they have not been up to expectation. There have been numerous small orders. Plant operations are now on the same schedule as before Christmas.

Coke.—There has been a general improvement both in foundry and domestic coke. Cold weather stimulated domestic buying, while restricted December buying is being reflected in the present foundry demand. Quotations continue at $5 per ton.

Old Materials.—Conditions appear more favorable. There were more inquiries last week, but buying was not heavy enough to affect prices.

Prices per gross ton, delivered Birmingham district consumers' yards:

Heavy melting steel	$10.00 to $10.50
Scrap steel rails	11.00 to 11.50
Short shoveling turnings	8.00 to 8.50
Cast iron borings	8.00 to 8.50
Stove plate	13.00 to 14.00
Steel axles	19.00 to 20.00
Iron axles	18.00 to 20.00
No. 1 railroad wrought	10.00 to 11.00
Rails for rolling	12.00 to 13.00
No. 1 cast	14.50 to 15.00
Tramcar wheels	12.50 to 13.50
Cast iron carwheels	12.00 to 13.00
Cast iron borings, chemical	13.50 to 14.00

Warehouse Prices, f.o.b. St. Louis

	Base per Lb.
Plates and structural shapes	3.25c.
Bars, soft steel or iron	3.15c.
Cold-finished rounds, shafting and screw stock	3.75c.
Black sheets (No. 24)	4.45c.
Galvanized sheets (No. 24)	5.25c.
Blue annealed sheets (No. 10)	3.60c.
Black corrugated sheets (No. 24)	4.50c.
Galvanized corrugated sheets	5.30c.
Structural rivets	3.75c.
Boiler rivets	3.75c.
	Per Cent Off List
Tank rivets, $\frac{7}{16}$-in. and smaller, 100 lb. or more	70
Less than 100 lb	65
Machine bolts	60
Carriage bolts	60
Lag screws	60
Hot-pressed nuts, square, blank or tapped, 200 lb. or more	60
Less than 200 lb	50
Hot-pressed nuts, hexagons, blank or tapped, 200 lb. or more	60
Less than 200 lb	50

St. Louis

Pig Iron and Steel Trade Active—Much Heavier Iron Melt

ST. LOUIS, Jan. 17.—Melters in the St. Louis industrial district report a greatly improved business, the pig iron trade continues good, and prospects are for a steady flow of buying. Plants catering to the railroad car trade, wheel foundries, implement makers and radiator concerns are showing a much heavier melt. A steel mill on the East Side is now operating two open-hearth furnaces, and will put on another, having sufficient orders booked now to operate all until June 30. Stove foundries have halted buying temporarily on account of inventory taking. Pig iron makers believe that prices will go higher. Sales of the Granite City maker during the week totaled 8500 tons, all for first quarter shipment. The largest sale was 3000 tons of foundry iron to an East Side melter. All sales were of foundry iron, including 200 tons of malleable. A leading Southern interest sold 800 tons.

Prices per gross ton at St. Louis:

No. 2 fdy., sil. 1.75 to 2.25 f.o.b. Granite City, Ill.	$19.50 to $20.00
Northern No. 2 fdy., delivered St. Louis	20.66
Southern No. 2 fdy., delivered	20.42
Northern malleable, delivered	20.66
Northern basic, delivered	20.66

Freight rates: 81c. from Granite City to St. Louis; $2.16 from Chicago; $4.42 from Birmingham.

Coke.—Domestic coke demand is reported less active as a result of warmer weather. Metallurgical grades are moving in fair quantities now that the melt of pig iron is increasing.

Finished Iron and Steel.—The Wabash Railroad has bought the necessary bolts, spikes and rail joints for 20,000 tons of rails recently purchased. The orders went to the Illinois Steel Co., Inland Steel Co. and Bethlehem Steel Co. on the same basis as the rails were allocated. The rail joints were purchased from the Rail Joint Co. to be rolled by the mills. The Granite City mill reports starting the new year with a heavy backlog of orders for sheets and plates, and with large specifications against contracts. The car-building trade is also active. Warehouse business is light. Business with structural fabricators is extremely dull.

Old Material.—A leading mill in the district has bought about 7500 tons of melting steel for delivery within the next 60 days. This has had the effect of halting the steady advance of this item. Present prices paid by dealers probably will continue until such time as they are covered on this order or until some other large consumer comes into the market for tonnage. The market generally is strong. The only price changes are an advance of 50c. a ton on iron rails and 25c. a ton on No. 1 machinery cast. Railroad lists include: Rock Island, 4800 tons; Chicago & Alton, 1000 tons; Pullman Co. (St. Louis), 200 tons; and Mobile & Ohio, 100 tons.

Prices per gross ton f.o.b. dealers' yards and delivered St. Louis district consumers' works:

Heavy melting steel	$12.75 to $13.25
No. 1 locomotive tires	14.00 to 14.50
Heavy shoveling steel	12.75 to 13.25
Miscellaneous standard-section rails, including frogs, switches and guards, cut apart	14.50 to 15.00
Railroad springs	15.25 to 15.75
Bundled sheets	9.00 to 9.50
No. 2 railroad wrought	12.75 to 13.25
No. 1 busheling	11.00 to 11.50
Cast iron borings	10.00 to 10.50
Iron rails	14.00 to 14.50
Rails for rolling	15.50 to 16.00
Machine shop turnings	8.50 to 9.00
Steel car axles	20.00 to 20.50
Iron car axles	24.00 to 24.50
Wrought iron bars and transoms	21.00 to 21.50
No. 1 railroad wrought	11.50 to 12.00
Steel rails, less than 3 ft.	16.00 to 16.50
Steel angle bars	14.00 to 14.50
Cast iron carwheels	14.25 to 14.75
No. 1 machinery cast	16.00 to 16.50
Railroad malleable	13.00 to 13.50
No. 1 railroad cast	14.00 to 14.50
Agricultural malleable	12.50 to 13.00
Relaying rails, 60 lb. and under	20.50 to 23.50
Relaying rails, 70 lb. and over	26.50 to 29.00

Canada

Railroads Placing Equipment Orders—Pig Iron More Active

TORONTO, ONT., Jan. 17.—Canadian railroads are now giving attention to their equipment needs. The Canadian Pacific Railway has placed orders involving an expenditure of upward of $3,000,000, comprising the following: 20 coaches, 5 cafe parlor cars, 15 palace horse cars, 300 automobile cars, 200 freight refrigerator cars, 50 75-ton Hart Otis ballast cars. The cars will be built by the National Steel Car Co. and the Canadian Car & Foundry Co. Other orders placed include: Newfoundland Railroad, three steam self-propelled passenger cars; and Alberta Government Railways, two cabooses. The Dominion Coal Co. is having 30 automatic drop slide dump cars, built by the Eastern Car Co. The Algoma Central & Hudson Bay Railroad is contemplating ordering some locomotives. The Toronto, Hamilton & Buffalo Railroad is negotiating for three freight locomotives.

Pig Iron.—Sales are steadily increasing in the Canadian pig iron markets. Single car orders predominate, but there is also a good sprinkling of orders for 200 to 500 tons for immediate delivery. As the Canadian demand for pig iron tends to improve, outside competition also has become more active. The production of pig iron in Canada continues on the same level as it did throughout the greater part of last month. Five blast furnaces are blowing in Canada. Prices are firmer.

Prices per gross ton:

Delivered Toronto	
No. 1 foundry, sil. 2.25 to 2.75	$23.60
No. 2 foundry, sil. 1.75 to 2.25	23.60
Malleable	23.60
Delivered Montreal	
No. 1 foundry, sil. 2.25 to 2.75	25.00
No. 2 foundry, sil. 1.75 to 2.25	25.00
Malleable	25.00
Basic	24.00
Imported Iron at Montreal Warehouse	
Summerlee	33.50
Carron	33.00

Old Material.—Sales for the week again showed improvement over those of the previous week. The improved demand has not brought with it a more active buying movement on the part of dealers, but on the contrary the latter are holding their purchases to a minimum. Prices are somewhat weak, but have not been changed.

Dealers' buying prices:

	Toronto	Montreal
Per Gross Ton		
Heavy melting steel	$9.00	$8.00
Rails, scrap	10.00	10.00
No. 1 wrought	9.00	11.00
Machine shop turnings	7.00	6.00
Boiler plate	7.00	7.00
Heavy axle turnings	7.50	7.50
Cast borings	7.50	6.00
Steel turnings	7.00	6.50
Wrought pipe	5.00	6.00
Steel axles	14.00	19.00
Axles, wrought iron	16.00	21.00
No. 1 machinery cast	....	16.00
Stove plate	....	12.00
Standard carwheels	....	14.50
Malleable	....	13.00

Stove plate	9.00	....
Standard carwheels	13.00	....
Malleable scrap	13.00	....

Youngstown

New Business Lighter But Mills Are Operating at Good Rate

YOUNGSTOWN, Jan. 17.—New business is somewhat lighter than it has been recently with steel companies here, but this development is commonly regarded as the natural sequence of the fact that consumers are pretty well covered against current requirements and are pausing to let consumption catch up before making further commitments. There has been no letdown in steel works or rolling mill activities, but it is possible that the putting on of additional productive capacity has been delayed by the recession in new orders and specifications.

The price situation is less disturbing to producers than it was a short time ago, for while present bookings carry prices that yield only a small profit on plant operations as low as those over most of the last half of 1927, the margin is somewhat increased by the fact that there is now an engagement of approximately 75 per cent of steel-making capacity, as compared with less than 50 per cent at the low point of about two months ago. Sheet mill operations in this district are very high and there is a good schedule for the bar mills, while makers of strip steel also are busier than they have been in several weeks. Pipe mill capacity is not heavily taxed, since business is good only in line pipe. Tin plate production, in spite of recent improvement in demand, is well under that at this time last year.

Sheet bars are moving with more freedom as a result of the fuller sheet mill schedules. Makers here insist that the price is $34, or $34.50 delivered in the immediate Youngstown district. Mills no longer produce many billets or slabs for the market.

Pig iron business is steady, with makers still quoting No. 2 foundry and malleable iron at $17.50, furnace, and basic at $17. Some business in foundry iron has been taken at $17.50 for shipment at low freight rates. For shipment to more distant points, $17.25, furnace, has had to be done. Similarly on basic iron, considerably less than the equivalent of $17, Valley furnace, has been done at some destinations. A Sharon, Pa., steel foundry recently bought 1000 tons of basic iron at $17, furnace, or $17.50 delivered.

The scrap market has weakened and heavy melting steel now is not salable at more than $15.50. While dealers are asking $15 for compressed sheet scrap, it looks as if they would have to be content with less, as the increased activity of the sheet mills is resulting in increased offerings, and a rising scale of productive activity in the motor car industry is bringing out freer offerings from that direction. Lake navigation being closed, Detroit scrap can move only to its natural rail markets, or to Mansfield, Canton, Massillon or Youngstown. Incidentally, an effort is being made by scrap consumers in those centers to obtain a downward revision of railroad rates on scrap from Detroit, and a meeting is to be held today in Cleveland to consider the matter. This meeting will be followed by a formal presentation of the case to Central Freight Association officials in Chicago.

Boston

Cast Iron Pipe Active—Pig Iron Unchanged—Scrap Weaker

BOSTON, Jan. 17.—A sale of 900 tons of special Buffalo pig iron was the largest transaction of the past week. Several smaller lots of Buffalo iron were sold at $16.50 to $17, furnace, for No. 2X, and at $17 and $17.50 for No. 1X, also small lots of Mystic and Champlain irons, but the aggregate was unimportant. Quite a tonnage in pending business is reported. The advance of 50c. a ton on eastern Pennsylvania iron places it at a further disadvantage here, and sales are confined to scattered small lots for mixture purposes.

Warehouse Prices, f.o.b. Boston

	Base per Lb.
Plates	3.365c.
Structural shapes—	
Angles and beams	3.365c.
Tees	3.365c.

Hot-pressed nuts	50 and 5
Cold-punched nuts	50 and 5
Stove bolts	70 and 10

Prices of foundry iron per gross ton, delivered to most New England points:

Buffalo, sil. 1.75 to 2.25	$21.41 to	$21.91
Buffalo, sil. 2.25 to 2.75	21.91 to	22.41
East. Penn., sil. 1.75 to 2.25		23.15
East. Penn., sil. 2.25 to 2.75		23.65
Virginia, sil. 1.75 to 2.25		25.71
Virginia, sil. 2.25 to 2.75		26.21
Alabama, sil. 1.75 to 2.25	22.91 to	24.77
Alabama, sil. 2.25 to 2.75	23.41 to	25.27

Freight rates: $4.91 from Buffalo, $3.65 from eastern Pennsylvania, $5.21 all rail from Virginia, $6.91 to $8.77 from Alabama.

Coke.—No increase in the movement of by-product foundry coke is noted. Prices remain unchanged at $11.50 a ton, delivered within a $3.10 freight rate zone. Indications are there will be a change in the price before Feb. 1, but producers are not ready to say in which direction. Railroads have put into effect new rates on fuel from Holyoke, Mass., and Manchester, N. H., an indication of increased competition between gas companies and by-product ovens for domestic coke business. Owing to mild weather, stocks of domestic fuel at Everett, Mass., and at Providence, R. I., have increased. Domestic coke is still on a basis of $8.50 a ton at ovens, Everett.

Cast Iron Pipe.—Wilmington, Mass., has closed with the Warren Foundry & Pipe Co. for approximately 2000 tons of 6 to 14-in. water pipe, and Boston has ordered 900 tons of 8-in., 50 tons of 10-in., 800 tons of 12-in. and 50 tons of 30-in. pipe and 250 tons of fittings. The Warren Foundry & Pipe Co. was second low bidder on the Boston business, B. Nicoll & Co. being the lowest. No other open municipal business was closed the past week, but some good tonnages went privately, the aggregate sales running in excess of 6000 tons. Medford, Mass., closed bids Wednesday, Jan. 18, on 250 tons of 6 to 12-in. water pipe. It is reported that Stone & Webster, Inc., is about to close on its 1928 gas pipe requirements, which will be about 2000 tons. Private water pipe sales are at $45.10 to $46.10 a ton, delivered common Boston freight rate points, for 4-in. and $41.10 to $42.10 a ton for 6 to 12-in. Concessions of $1 a ton or more are made on larger pipe. The usual $5 differential is asked on class A and gas pipe.

Shapes and Plates.—Fabricators took no large tonnages in the past week, but indications are that several good tonnages will be closed this week. For a new court house at Providence, R. I., calling for 1000 tons of steel, some low fabricated steel prices have been quoted. Railroads are specifying freely against plate contracts. The New Haven recently placed some sizable tonnages. There is a big gasoline tank business, however, but little money in it for the fabricator owing to keen competition. Boiler shops are securing some stack business. The market for standard shapes and plates is firm at 1.80c. per lb., base Pittsburgh.

Warehouse Business.—Warehouse prices are steadier than they have been in months. Most sellers are now holding to list prices.

Cold Rolled Strip Steel.—Prices are steady and unchanged.

Mill Prices on Cold-Rolled Strip in North Atlantic States: In 1 to 3-ton lots, 3.25c. per lb., base Pittsburgh, and also, 3.25c. to 3.40c. per lb., base Worcester, Mass.

Reinforcing Bars.—About 5000 tons of bars involved in the Sears, Roebuck & Co. plants at Boston and Cambridge is not yet placed. Current activity is confined to small tonnages, which in the aggregate are fairly satisfactory. Prices remain firm on a basis of 1.90c. a lb., Pittsburgh, or 2.26½c., delivered common Boston freight rate points. Warehouse prices range from 2.70c. to 2.75c., base, mostly 2.75c.

Old Material.—Most of the transactions in heavy melting steel the past week were at $9.10 a ton on cars, shipping point, while the average range of quotations is $9 to $9.25. Current activity is largely confined to that material and long bundled skeleton, scrap rails, steel turnings, mixed borings and turnings, forged scrap, forged flashings and specification pipe. Supplies of scrap in first hands are comparatively small, and a feeling persists among dealers that it would not take much of an increase in buying to lift values. In contrast, further weakness was reported yesterday from the Pittsburgh district.

Buying prices per gross ton f.o.b. Boston rate shipping points:

No. 1 heavy melting steel	$9.00 to $9.25
Scrap rails	8.75 to 9.00
No. 1 railroad wrought	10.50 to 11.00
No. 1 yard wrought	8.50 to 9.00
Machine shop turnings	6.00 to 6.50
Cast iron borings (steel works and rolling mill)	6.00 to 6.25
Bundled skeleton, long	5.60 to 6.00
Forge flashings	6.00 to 6.50
Blast furnace borings and turnings	6.00 to 6.25
Forge scrap	6.00 to 6.50
Shafting	13.00 to 13.50
Street car axles	15.50 to 16.00
Wrought pipe (1 in. in diameter, over 2 ft. long)	7.50 to 8.00
Rails for rerolling	10.00 to 10.50
Cast iron borings, chemical	10.00 to 10.50

Prices per gross ton delivered consumers' yards:

Textile cast	$14.00 to $14.50
No. 1 machinery cast	14.00 to 15.00
No. 2 machinery cast	12.50 to 13.00
Stove plate	11.00 to 11.50
Railroad malleable	13.00 to 13.50

Cincinnati

Foundries Making Automobile Castings Increase Melt—Scrap Higher

CINCINNATI, Jan. 17.—While foundries associated with the automotive industry have increased operations, jobbing foundries in this district are running on a sharply curtailed basis. Consequently the general demand for foundry iron has been light. Prices are attracting little comment, because the situation is such that no downward turn is anticipated and, on the other hand, the condition of the market does not encourage an advance. Lake Erie iron is being sold at $16.50, base furnace, and southern Ohio iron at $19, base furnace. The schedule on Tennessee and Alabama iron is unchanged at $16, base Birmingham. A central Indiana foundry is reported to have closed for 1400 tons. Inquiries include 800 tons for a Dayton, Ohio, company and 500 tons for the American Seeding Machine Co. at Springfield, Ohio, the former specifying second quarter delivery.

Prices per gross ton, delivered Cincinnati:

So. Ohio fdy., sil. 1.75 to 2.25	$20.89
So. Ohio malleable	$20.14 to 20.89
Alabama fdy., sil. 1.75 to 2.25	19.69
Alabama fdy., sil. 2.25 to 2.75	20.19
Tennessee fdy., sil. 1.75 to 2.25	19.69
Southern Ohio silvery, 8 per cent	26.89

Freight rates, $1.89 from Ironton and Jackson, Ohio; $3.69 from Birmingham.

Finished Material.—Increasing signs are evidence of a gradually strengthing market. Now that consumers have completed inventories and are in a position to know definitely their immediate requirements, mills are receiving numerous requests for prompt shipment of material. Usually specifications ask for January and February deliveries, although a few users have anticipated their needs for the entire first quarter. The outlook for sheet producers in this district is particularly bright. There is a well balanced demand from the automobile industry, while railroads and electrical manufacturers have been liberal purchasers. In fact, all consuming lines have come forward with orders so that mills necessarily have had to increase operating schedules to meet delivery promises. In some cases backlogs are sufficient to insure continuance of production on the recently established scale for two weeks. Another indication of stability is the fact that consumers who had failed to protect themselves at the old prices are now paying the new prices with little protest. There is some shading of quotations in galvanized sheets, but this is the exception rather than the rule, most orders being booked at 3.75c., base Pittsburgh. In blue annealed stock the ruling price of 2.10c. on widths up to 40 in. has not been questioned, while black sheets are steady at 2.90c. Bars, structural shapes and plates are firm at 1.80c., base Pittsburgh. The structural steel market is quiet, but several important jobs are in the making. Common wire nails are being held at $2.55 per keg, Ironton or Pittsburgh, with barge rates applying on shipments to consuming points along the Ohio River.

Warehouse Prices, f.o.b. Cincinnati

	Base per Lb.
Plates and structural shapes	3.40c.
Bars, soft steel or iron	3.30c.
Reinforcing bars	3.30c.
Hoops	4.00c. to 4.25c.
Bands	3.95c.
Cold-finished rounds and hexagons	3.85c.
Squares	4.35c.
Open-hearth spring steel	4.75c. to 5.00c.
Black sheets (No. 24)	4.05c.
Galvanized sheets (No. 24)	4.90c.
Blue annealed sheets (No. 10)	3.60c.
Structural rivets	3.85c.
Small rivets	65 per cent off list
No. 9 annealed wire, per 100 lb.	$3.00
Common wire nails, base per keg	2.95
Cement coated nails, base 100 lb. keg	2.95
Chain, per 100 lb.	7.55
	Net per 100 Ft.
Lap-welded steel boiler tubes, 2-in.	$18.00
4-in.	38.00
Seamless steel boiler tubes, 2-in.	19.00
4-in.	39.00

Warehouse Business.—There has been a slight improvement in sales, but business remains at a low point. Tank plates is the only commodity for which there is a pronounced demand. Irregularities which have existed for a considerable time in common wire nails have practically disappeared, and jobbers are maintaining the published price of $2.95 a keg. Quotations on other products are firm.

Coke.—Expansion of activities in foundries producing automobile castings has brought about an increased movement of by-product foundry coke since Jan. 1, and present indications are that shipments this month will run considerably ahead of those in December. The domestic coke market, however, is glutted with material which has not been sold on account of the mild weather. Sales of Wise County and New River beehive coke have been small.

Foundry coke prices per net ton, delivered Cincinnati: By-product coke, $9.52 to $9.64; Wise County coke, $7.59 to $8.09; New River coke, $10.09 to $10.59. Freight rates: $2.14 from Ashland, Ky.; $2.59 from Wise County and New River ovens.

Old Material.—Heavy melting steel has advanced 25c. a ton and several other items also have gone to higher levels in the past week. While stronger prices are largely attributed to the speculation of dealers, the stepping up production in steel plants in this district, with the probability of the need for more scrap, has been a factor.

Dealers' buying prices per gross ton f.o.b. cars, Cincinnati:

Heavy melting steel	$11.75 to $12.25
Scrap rails for melting	12.50 to 13.00
Loose sheet clippings	9.00 to 9.50
Bundled sheets	9.50 to 10.00
Cast iron borings	8.50 to 9.00
Machine shop turnings	8.50 to 9.00
No. 1 busheling	10.50 to 11.00
No. 2 busheling	7.50 to 8.00
Rails for rolling	13.00 to 13.50
No. 1 locomotive tires	13.50 to 14.00
No. 1 railroad wrought	11.50 to 12.00
Short rails	17.00 to 17.50
Cast iron carwheels	13.00 to 13.50
No. 1 machinery cast	16.00 to 17.00
No. 1 railroad cast	13.50 to 14.00
Burnt cast	8.00 to 8.50
Stove plate	9.25 to 9.75
Brake shoes	10.00 to 10.75
Railroad malleable	12.75 to 13.25
Agricultural malleable	12.25 to 12.75

Warehouse Prices, f.o.b. Buffalo

	Base per Lb.
Plates and structural shapes	3.40c.
Soft steel bars	3.30c.
Reinforcing bars	2.75c.
Cold-finished flats, squares and hexagons	4.45c.
Rounds	3.95c.
Cold rolled strip steel	5.85c.
Black sheets (No. 24)	4.30c.
Galvanized sheets (No. 24)	5.15c.
Blue annealed sheets (No. 10)	3.80c.
Common wire nails, base per keg	$3.65
Black wire, base per 100 lb.	3.90

Buffalo

Steel Works Operations Average 70 Per Cent—Scrap Stronger

BUFFALO, Jan. 17.—Inquiry is light for sizable tonnages of pig iron, but a number of small lots are pending. The New York Air Brake Co. has been seeking 1000 tons of malleable for its Watertown, N. Y., plant. Another Watertown melter bought 500 tons of foundry. A few small inquiries came out of New Jersey. The Donner Steel Co., which banked a furnace the first of the month, will have it back in blast by the early part of February. On Buffalo district quotations $17 is firmly held.

Prices per gross ton, f.o.b. furnace:

No. 2 plain fdy., sil. 1.75 to 2.25	$17.00
No. 2X foundry, sil. 2.25 to 2.75	17.50
No. 1X foundry, sil. 2.75 to 3.25	18.50
Malleable, sil. up to 2.25	17.50
Basic	17.00
Lake Superior charcoal	27.28

Finished Iron and Steel.—General business is good, with mill operation continuing to average around 70 per cent. The Lackawanna plant of the Bethlehem Steel Co. has been able to maintain an uninterrupted output of 85 per cent for some weeks and the Seneca Iron and Steel Co. is likewise operating at this rate. Other mills are around 50 or 60 per cent. Bars, shapes and plates are steady at 1.90c. Bolt and nut prices are fairly firm, though there has been some shading. Pipe specifications are holding up well, though the general plumbing and supply business is not active. Black sheet prices range between 2.80c. and 2.90c., and the price on auto body sheets for prompt delivery is 4c. Reinforcing bar makers expect to take considerable business in the near future, as some sizable jobs are being figured.

Old Material.—Dealers have been making rather an active market in steel, some of them having paid as high as $15 to $15.50 for No. 1 heavy melting steel, applying it against orders taken at $15. There has been no new buying by the mills, but shipments to one mill have gained a little. The steel rail market shows a little strengthening, with the price now $16.50 to $17. Railroad lists closing the end of the week brought higher prices than the mills have paid, No. 1 steel selling at $15.25.

Prices per gross ton, f.o.b. Buffalo consumers' plants:

Basic Open-Hearth Grades	
No. 1 heavy melting steel	$14.50 to $15.00
No. 2 heavy melting steel	13.25 to 13.50
Scrap rails	13.75 to 14.25
Hydraulic compressed sheets	13.50 to 14.00
Hand bundled sheets	8.50 to 9.00
Drop forge flashings	11.50 to 12.00
No. 1 busheling	13.50 to 14.00
Heavy steel axle turnings	12.75 to 13.25
Machine shop turnings	9.00 to 9.25
Acid Open-Hearth Grades	
Railroad knuckles and couplers	15.50 to 15.75
Railroad coil and leaf springs	16.00 to 16.50
Rolled steel wheels	14.75 to 15.25
Low phosphorus billet and bloom ends	15.75 to 16.00
Electric Furnace Grades	
Heavy steel axle turnings	12.75 to 13.25
Short shoveling steel turnings	10.75 to 11.00
Blast Furnace Grades	
Short shoveling steel turnings	10.75 to 11.00
Short mixed borings and turnings	11.00 to 11.50
Cast iron borings	11.00 to 11.50
No. 2 busheling	9.00 to 9.50
Rolling Mill Grades	
Steel car axles	16.00 to 16.50
No. 1 railroad wrought	12.00 to 12.50
Cupola Grades	
No. 1 machinery cast	14.50 to 15.00
Stove plate	12.75 to 13.00
Locomotive grate bars	10.50 to 11.00
Steel rails, 3 ft. and under	16.00 to 16.50
Cast iron carwheels	14.00 to 14.50
Malleable Grades	
Railroad	15.00 to 15.50
Agricultural	15.00 to 15.50
Industrial	15.00 to 15.50

The Struthers Furnace Co. has established headquarters in the office building at Struthers, in connection with the merchant stack, and has abandoned its offices in the City Bank Building, Youngstown. Plans are being developed to start the furnace in the spring.

Detroit

Steady Improvement in Business—Automobile Schedules Increased

DETROIT, Jan. 17.—Conditions in the steel market in the Detroit area are showing improvements, as reflected by the steady increase in production in the automotive industry. For the first time since the summer of 1926 the employment index for the area shows an increase over figures for the preceding year. For the week ended Jan. 3 this increase was 960 compared with the corresponding week in 1927.

The Hudson Motor Co. is scheduling a larger production than for any previous year. The Hudson Essex Co.'s present schedule is almost double that of last year, and the number of men employed will soon reach 20,000 at the present rate of increase.

The Ford Motor Co.'s payroll now amounts approximately to 83,000 men, with 50,500 at the Fordson plant, 27,800 at Highland Park and 4700 at the Lincoln plant. The increase since Dec. 22 amounts to 5700.

Prices in the alloy steels have not changed from previously quoted figures, but are firmer. The question of deliveries is now becoming important, a condition which has not existed recently. Practically the same conditions apply to auto body sheet and blue annealed sheet.

The demand for structural shapes, bars and plates is not as active as in December. Prices remain firm at 1.80c., Pittsburgh, for large lots and 1.90c. for carloads and less. Most of the present volume is made up of small orders.

Pig iron booked for the quarter is on a par with the same period in 1927 and melters are specifying increased tonnages.

Automotive shops are on a high production basis and radiator, stove and furnace manufacturers are getting into production and will show a volume considerably above the last quarter of 1927.

The market on old material in the district remains firm with no advances registered during the past week.

Dealers' buying prices per gross ton, f.o.b. cars, Detroit:

Heavy melting and shoveling steel	$12.00 to $12.50
Boring and short turnings	9.00 to 9.50
Long turnings	7.75 to 8.25
No. 1 machinery cast	16.00 to 17.00
Automobile cast	18.00 to 19.00
Hydraulic compressed sheets	10.75 to 11.25
Stove plate	11.50 to 12.50
No. 1 busheling	9.50 to 10.00
Sheet clippings	7.50 to 8.00
Flashings	10.00 to 10.50

Automotive Output High

With a good start given to motor car sales by public interest in the new products exhibited at the New York show, says *Automotive Industries*, production at the factories is at a high level for the season. It is estimated that current output is 20 to 25 per cent above the rate of the corresponding period of 1927. The carry-over of unsold cars into 1928 was exceptionally moderate, and dealers in many lines are in position to stock cars for demonstration as well as deliveries.

Motor vehicle registrations in the United States totaled 23,302,668 on Jan. 1, 1928, according to figures compiled by *Automotive Industries*. This compares with 22,046,957 at the beginning of 1927. Passenger cars alone totaled 20,333,988, against 19,207,808 on the earlier date, while trucks and buses at 2,968,680 compared with 2,839,149 at the beginning of 1927.

Discussion of "What Is the Limiting Temperature in Central Station Operation" will be led by V. T. Malcolm, metallurgical engineer Chapman Valve Mfg. Co., Indian Orchard, Mass., at a meeting of the power division of the American Society of Mechanical Engineers to be held at the Engineering Societies Building, New York, on the evening of Jan. 30.

OBITUARY

William Schwanhausser, chief engineer of the Worthington Pump & Machinery Corporation, New York, died on Jan. 15 at the Peck Memorial Hospital, Brooklyn, after an illness of three months. He was 73 years of age. Born at Wurzburg, Bavaria, Mr. Schwanhausser received apprenticeship training in a sugar machinery manufacturing plant in that country, and later attended the Polytechnic Institute in Mittweida, Saxony, from which he received an M.E. degree. After coming to this country, he was employed by Osterheld & Eichmeyer, Yonkers, N. Y., where he assisted in the development of engines, pumps, typewriters and other equipment. Later he served for eight years as assistant general superintendent of the Otis Elevator Co. In 1885 he was placed in charge of the manufacture of trade pumps for the Worthington Pump Works, Brooklyn. He took charge of the Worthington plant in Germany in 1895 and in 1906, was made chief and consulting engineer of the International Steam Pump Co., which later became a part of the present Worthington organization. He was a member of the American Society of Mechanical Engineers, the Institute of Mechanical Engineers of Great Britain, the Naval Architects of Great Britain and Germany, the Technical Society of New York and of the Verein Deutscher Ingeneure of Berlin.

W. SCHWANHAUSSER

—

Alexander E. Outerbridge, Jr., for nearly 40 years metallurgist for William Sellers & Co., Inc., Philadelphia, died on Jan. 15 at his home in Chestnut Hill, Pa. He was born in 1850 and had devoted his life to metallurgical work prior to partial retirement some years ago. Last month he was awarded the William H. McFadden gold medal of the American Foundrymen's Association in recognition of his contributions to the knowledge of cast iron metallurgy. Coincident with this award a more detailed account of Mr. Outerbridge's career appeared in The Iron Age of Dec. 15, 1927, page 1704.

—

Charles A. Knill, associated for nearly 40 years with Charles A. Besly & Co., 118 North Clinton Street, Chicago, died at Rochester, Minn., on Dec. 24.

—

Richard J. Dibowski, secretary, a director and one of the founders of the Wadsworth Electric Mfg. Co., Covington, Ky., died recently at his home in that city, aged 53 years. He was a director of the Associated Industries of Kentucky and was prominently identified with civic and social activities in that State.

—

J. A. Hellstrom, president of the Richard Mfg. Co., Bloomsburg, Pa., and also chief engineer of the Wheeling Mold & Foundry Co., Wheeling, W. Va., died recently at his home in Wheeling. He was a graduate of the University of Stockholm, Sweden, and came to this country shortly after finishing his college training to enter the service of the Baldwin Locomotive Works, Philadelphia. He was later associated with the Cambria Iron Co., the Du Bois Iron Works and the Jones & Laughlin Steel Co. He went to Wheeling as chief engineer of the Mold & Foundry company in 1905. He had been associated with the Richard company for 10 years.

—

Julius Jonson, for 20 years president and general manager of the former Jonson Foundry & Machine Co., 118th Street and Harlem River, New York, and well known as an engineer and an inventor, died at his home in Mount Vernon, N. Y., on Jan. 2. He was born in Germany in 1843 and came to the United States when he was four years old. He was graduated from the Maryland Institute of Design, Baltimore, and during the Civil War was in charge of the construction of engines for Federal gunboats. After the war he was associated for several years with the Cumberland Coal & Iron Co., Cumberland, Md. After locating in New York he served as assistant engineer in the Department of Public Works, and was prominently identified with the construction of street railroads. He is credited with the invention of the crossing gate for railroads.

—

Allen H. Moore, former chairman of the standardization committee of the General Electric Co., Schenectady, N. Y., died Jan. 10 at his home in Albany, N. Y., aged 62 years. He had been in failing health for several months.

—

Mallory P. Spencer, general sales manager of the Halcomb plant of the Crucible Steel Co. of America, Syracuse, N. Y., died Jan. 8, from the effects of monoxide gas, inhaled in his garage. He was 45 years of age.

—

Harry Benjamin, president of the Harry Benjamin Equipment Co., St. Louis, died recently at his home in that city after a long illness. He was born at New Orleans, June 10, 1862, and attended the public schools of New Orleans and Cincinnati. At an early age he entered the office of the Block Pollak Iron Co., Cincinnati, advancing to the position of assistant purchasing agent and treasurer. In 1906, when that firm opened a branch office in St. Louis, he took charge, serving until 1911, when the firm was liquidated. He then organized its successor, the Harry Benjamin Equipment Co., specializing in the handling of railroad equipment and metals.

—

Charles G. Tiefel, a director of the Todd Co., Rochester, N. Y., and for many years superintendent of the old firm of O. W. Todd & Co., manufacturers of the protectograph, died in Rochester, on Dec. 27, aged 66 years.

—

J. Howard McFeely, vice-president in charge of sales for the McFeely Brick Co., manufacturer of silica brick, with plants at Latrobe and Port Matilda, Pa., died Dec. 26, at his home in Pittsburgh. He was born in Steubenville, Ohio, 50 years ago but had resided in Pittsburgh since boyhood.

—

William A. Cooper, for more than 40 years connected with the Alan Wood Iron & Steel Co., Philadelphia, died Dec. 29 at the age of 73. Until three years ago he was for many years manager of the Schuylkill Iron Works department of the company at Conshohocken, Pa. He was a member of the committee on corrosion of iron and steel of the American Society for Testing Materials.

—

Herman Belmer, president of the H. Belmer Co., Cincinnati, jobber of wire goods, died at his home in that city Jan. 7, following an illness of six months. He was 86 years of age. Born in Germany, he came to the United States at an early age and located in Cincinnati. Soon after the Civil War, in which he served with the First Ohio Volunteers, he founded the H. Belmer Co., which for many years has been one of the leading wire jobbing houses in the Cincinnati district. He also was formerly vice-president of the Cincinnati Barbed Wire Fence Co.

—

James Doherty, formerly vice-president in charge of sales for the Utica Heater Co. and well known in the stove and heater trade both in Canada and the United States, died suddenly at his home in Chicago on Dec. 26. He was born at Uttoxeter, Ont., and after gaining business experience in his father's company he joined the staff of the Utica Heater Co. and was appointed to the Boston office in charge of New England territory in 1907. In 1912 he went to Sarnia, Ont., as manager of the Doherty Mfg. Co., Ltd., and effected a considerable enlargement of the plant. After two years he joined the Utica company at its Chicago office, eventually becoming vice-president in charge of sales. While at Chicago he perfected various improvements in smokeless heating boilers which have been made the standard practice of the National Radiator Corporation, with which the Utica Heater Co. was recently merged.

—

John W. Murray, for 26 years superintendent of the spike and bolt department at the Joliet, Ill., works, Illinois Steel Co., died Jan. 6 in a Chicago hospital after an illness of four weeks. He was born at Springfield, Ill., March 1, 1867, and had been an employee of the Illinois company at Joliet since 1885.

—

William Wieman, president Wieman & Ward Co., Pittsburgh, coal and coke dealer, died at his home in Sewickley, Pa., Jan. 12. Mr. Wieman was born in Columbus, Ohio, in 1874, but had been located in Pittsburgh and identified with the sale of pig iron, coal and coke for the past 25 years. He was associated with the iron, steel and fuel brokerage firm of Banning, Cooper & Co. before he went into business for himself about 12 years ago.

—

Frederick Brune, inventor of labor-saving devices for the sheet metal industry, died at his home in Milwaukee on Jan. 10, aged 70 years. He had been a director of the Barnes Zinc Products Co., Chicago, but retired a year ago.

—

Herbert G. Thomson, president of the Anchor Post Fence Co., New York, died on Jan. 11, immediately following an attack of acute appendicitis which he suffered when leaving the Grand Central Terminal in New York. He was 57 years of age and had been associated with the Anchor Post company and its predecessor since his graduation from the Sheffield Scientific School of Yale University in 1892. He became president of the company in 1902.

—

Daniel Kennedy, president and founder of the Kennedy Valve Mfg. Co., Elmira, N. Y., died on Dec. 14 at Hot Springs, Ark.

—

Everett J. Neville, formerly vice-president and general manager of the C. O. Bartlett & Snow Co., Cleveland, died Jan. 13 in Oakland, Cal. For several years he had represented the Universal Crane Co., Elyria, Ohio, as manager of its California sales. A son, C. J. Neville, is superintendent of the Bartlett & Snow plant.

—

Dan Shea, president of the Dan Shea Boiler Works, Inc., Memphis, Tenn., which he founded nearly 50 years ago, died on Jan. 11. He was 71 years of age.

Fabricated Structural Steel Bookings Make High Total in 1927

Washington, Jan. 17.—Computed bookings of fabricated structural steel in 1927 totaled 2,750,700 tons, representing 72 per cent of capacity, as against 2,553,540 tons in 1926, representing 67 per cent of capacity, according to the Department of Commerce. The increase in the year's total was 7.7 per cent, placing 1927 second only to 1925 in aggregate tonnage booked. Shipments in 1927 are computed at 2,626,680 tons, or 69 per cent of capacity, as compared with 2,842,920 tons, or 75 per cent of capacity, in 1926.

Bookings in December were 205,165 tons, according to reports received from 184 firms with a capacity of 274,865 tons, as against 187,188 tons in November, according to reports from 199 firms with a capacity of 279,110 tons. Computed bookings in December totaled 238,500 tons, as compared with 213,060 tons in November, while computed shipments were 225,780 tons for each month.

Philadelphia Foundrymen Appoint Committees for Convention

Arrangements in connection with the thirty-second annual convention and exhibition of the American Foundrymen's Association to be held in Philadelphia, May 14 to 18, were discussed at a meeting at the Union League, Philadelphia, Jan. 13, when representative manufacturers were the guests of G. H. Clamer, president Ajax Metal Co., and past president of the A. F. A.

C. E. Hoyt, executive secretary of the association, informed those present that indications point to the largest exhibit in the history of the organization.

Local committees were appointed and tentative plans for receiving and entertaining delegates were discussed. The chairmen of local committees are as follows:

G. H. Clamer, Ajax Metal Co., general committee; T. H. Addie, American Manganese Bronze Co., golf committee; Ralph Belleville, Joseph Dixon Crucible Co., ladies entertainment committee; J. A. Davies, Westinghouse Electric & Mfg. Co., hotel committee; Frederick M. Devlin, Philadelphia Hardware and Malleable Iron Works, entertainment committee; C. F. Hopkins, Ajax Metal Co., finance committee; B. H. Johnson, Cresson-Morris Co., plant visitation committee; Walter L. Kalbach, transportation committee; Laird U. Park, Park & Williams, Inc., reception committee; Earl S. Sparks, Metal Manufacturers' Association of Philadelphia, publicity committee.

A. W. Berresford Elected President of Engineering Council

The American Engineering Council at its annual meeting held in Washington, Jan. 10 and 11, elected A. W. Berresford, electrical engineer, New York, as president for 1928. Mr. Berresford, who is a past president of the American Institute of Electrical Engineers, succeeds Dr. Dexter S. Kimball, dean of the college of engineering, Cornell University.

Vice-presidents of the council are: L. P. Alford, New York; O. H. Koch, Dallas, Tex.; I. E. Moultrop, Boston, and G. S. Williams, Ann Arbor, Mich. H. L. Howe and L. W. Wallace, Washington, were again named treasurer and executive secretary, respectively. James T. Grady, Columbia University, New York, continues as publicity director.

Among other activities of the council was the discussion and vote of approval of a bill pending in Congress which would place the proposed National Hydraulic Laboratory in the Bureau of Standards. The council also favored in principle that section of a House bill which provides for the establishment of a bureau of labor statistics in the Department of Labor, but withheld indorsement for the creation of a safety museum.

Plans Arbitration for Steel Industry

Arbitration in industrial disputes soon may be adopted in the steel industry, according to Charles M. Schwab. Speaking at a luncheon at the Lawyers Club, New York, given by United States Attorney Charles H. Tuttle and the American Arbitration Association, Mr. Schwab said that he hoped to introduce a resolution at the next meeting of the American Iron and Steel Institute, officially bringing arbitration into use in the industry. He pointed out that in his own experience with the Carnegie and Bethlehem companies he had always found this method of settling disputes preferable to industrial litigation, and that the procedure when carried throughout the industry, would help to bring about good will both within and among the companies.

The application of motion study both in industrial and retail fields will be discussed and illustrated by motion pictures at a meeting of the management division of the American Society of Mechanical Engineers, to be held at the Engineering Societies Building, New York, on the evening of Jan. 30. One of the speakers will be J. A. Piacitelli, engineer Barber Asphalt Co., Maurer, N. J.

FABRICATED STRUCTURAL STEEL

New Projects Involve 41,400 Tons With 20,000 Tons for Cleveland Terminal Work

Awards, amounting to 22,750 tons in the last week, included 10,500 tons for an apartment and two office buildings in Chicago. Three buildings for the Cleveland Union Terminals Co., requiring 20,000 tons, brought the total of new projects to 41,400 tons. Awards follow:

Pennsylvania Railroad, 500 tons, bridges at Philadelphia, 200 tons, to an unnamed fabricator; bridges at Cape Charles, Va., 200 tons, to American Car & Foundry Co., and bridge at Woodlawn Avenue, Philadelphia, 100 tons, to Bethlehem Steel Co.

State of New Jersey, 200 tons, bridges for State Highway Commission at Clinton, N. J., to Bethlehem Steel Co.

Philadelphia, 460 tons, Tourison Building, Market Street, to Montgomery Iron & Steel Co.

Hagerstown, Md., 125 tons, boiler house, to Jones & Laughlin Steel Corporation.

State College, Pa., 800 tons, recreation building for Penn State College, to Bollinger-Andrews Co., Pittsburgh; previously reported awarded to H. K. Ferguson Co.

San Antonio, Tex., 3000 tons, Smith Brothers building, to an unnamed bidder.

La Salle, Ill., 350 tons, building for Marquette Cement Mfg. Co., to Rock Island Bridge Co., Rock Island, Ill.

Boston, 150 tons, building for McMillen Co., to Lehigh Structural Steel Co.

Cambridge, Mass., 175 tons, Third Street bridge, to Boston Structural Steel Co.

Bristol, R. I., 100 tons plates for yacht, to Lukens Steel Co.

New York, 2900 tons, section 11, route 101, subway; from Arthur A. Johnson Corporation, general contractor, to American Bridge Co.

New York, 2500 tons, commerce building for College of the City of New York, to Taylor-Fichter Steel Construction Co.; reported last week to an unnamed fabricator.

Kearny, N. J., 500 tons, three buildings for E. I. duPont de Nemours & Co., to Belmont Iron Works.

Somers Point, N. J., 150 tons, bridge; from F. W. Schwiers, Jr. & Co., general contractors, to Bethlehem Steel Co.

Cleveland, 110 tons, Pattison-Leitch Co. warehouse addition, to Jones & Laughlin Steel Corporation.

Chicago, 4300 tons, Woolworth Building, to American Bridge Co.

Chicago, 3200 tons, apartment building at 1500 Lake Shore Drive, to American Bridge Co.

Chicago, 3000 tons, Willoughby Building, to American Bridge Co.

Chicago, 1700 tons, Clark Street bascule bridge, to American Bridge Co.

Ellensburg, Wash., 285 tons, North Branch canal project, United States Bureau of Reclamation, to unnamed fabricator.

Seattle, 672 tons, Argo Crossing, to Hofius Steel & Equipment Co.

San Francisco, 160 tons, apartment building, Gough and Bush Streets, to Golden Gate Iron Works.

San Francisco, 140 tons, apartment building, Broderick and Haight Streets, to Herrick Iron Works.

San Francisco, 100 tons, apartment building, Scott Street, to Dyer Brothers.

San Francisco, 225 tons, apartment building, Leavenworth and O'Farrel Streets, to Central Iron Works.

Culver City, Cal., 150 tons, City Hall, to Brombacher Iron Works.

Los Angeles, 100 tons, apartment building, Bronson and Franklin Avenues, to Brombacher Iron Works.

Structural Projects Pending

Inquiries for fabricated steel work include the following:

Philadelphia, 150 tons, building for Abingdon Hospital.

Philadelphia, 800 tons, building for Army and Navy Y. M. C. A.

Cleveland, 700 tons, Whitehouse crossing grade elimination.

Cleveland, 20,000 tons, department store, medical office and garage buildings for Cleveland Union Terminals Co.

Lincoln, Neb., 1000 tons, section of State Capitol Building.

Cambridge, Mass., 450 tons, Lever Brothers plant addition.

Leominster, Mass., 100 tons, theater.

Lynn, Mass., 580 tons, Lynn Gas & Electric Co. power house addition.

Linden, Mass., 450 tons, boiler house for Linden Gas & Electric Co.; Stone & Webster, general contractors.

Boston & Maine Railroad, 1800 tons, bridge at Westboro, N. H.; bids to be retaken.

Providence, 1000 tons, Court House.

New Rochelle, N. Y., 400 tons, bridge to Glen Island for Westchester County Park Commission.

New York, 5000 tons, Lefcourt Building at Fifth Avenue and Forty-third Street.

New York, 900 tons, Proctor's Theater at Third Avenue and Fifty-eighth Street.

Ithaca, N. Y., 700 tons, residential building for Cornell University.

Philadelphia 350 tons, Stanley Theater on Frankford Avenue.

Chicago, 1400 tons, Sheridan Towers apartments.

Sand Point, Idaho, 1000 tons, highway bridge.

Yakima, Wash., 2000 tons, high line syphon.

Meyers Falls, Wash., 1700 tons, highway bridge.

San Francisco, 700 tons, second unit of apartment building, Chestnut and Hyde Streets; general contract to Dinwiddie Construction Co.

San Francisco, 180 tons, shapes for stock for Pacific Fruit Express Co.; bids in.

RAILROAD EQUIPMENT

Inquiries for 2300 Freight Cars — Canadian Pacific Purchases 550

Purchases by the Canadian Pacific of 550 freight cars was the outstanding transaction of the week. Pending business continues to increase, the outstanding inquiry coming from the Pacific Fruit Express for 2000 refrigerator cars. Details of the week's business follow:

Union Pacific will buy 23 4-12-2 type locomotives, six gas electric motor cars and eight trailers.

Pacific Fruit Express has issued an inquiry for 2000 refrigerator cars.

Southern Pacific is in market for 300 box car underframes and superstructure parts.

Quarahuy Eitaquy Estrado de Ferro, Brazil, has ordered one Pacific-type locomotive from Baldwin Locomotive Works.

Chicago, Burlington & Quincy will purchase six baggage, three combination passenger-baggage and 150 ballast cars.

St. Louis-San Francisco is inquiring for 30 air-dump cars.

South African Railways are inquiring for 100 40-ton gondola cars.

Great Northern will buy eight 30-cu. yd. air-dump cars.

Canadian Pacific has placed an order for 200 refrigerator cars, 15 palace horse cars and five parlor-café car frames with National Steel Car Corporation, and 300 automobile cars, 50 Hart-Otis ballast cars and 20 first-class passenger car frames with Canadian Car & Foundry Co.

New York Central has placed an order with American Car & Foundry Co. for rebuilding 33 steel underframe passenger coaches.

Mobile & Ohio has ordered three 72-ft. mail and baggage gas-electric rail motor cars from St. Louis Car Co.

Chicago & Alton is inquiring for two postal cars and seven combination baggage and mail cars.

Western Pacific has purchased four café cars from Pullman Car & Mfg. Corporation.

Atchison, Topeka & Santa Fe is inquiring for from 150 to 200 underframes.

Chesapeake & Ohio has made inquiry for 500 70-ton hopper car bodies and for repairs to 500 sets of 70-ton trucks.

Pig Iron Freight Rates Are Declared Reasonable

Washington, Jan. 17.—In a decision announced today the Interstate Commerce Commission held that the rate of $2.60 per gross ton on imported pig iron from Mobile, Ala., to Birmingham and Bessemer, Ala., and the rate of $3.93 from Mobile to Anniston, Ala., are not unreasonable. Shipside delivered rates are $4.16 and $4.49, respectively. Complaint was made against the rates by the United States Cast Iron Pipe & Foundry Co.

In another decision today the commission held that the rate of $2.90 per ton on pig iron from Indiana Harbor, Ind., and South Chicago, Ill., to Holland, Mich., is not unreasonable. Complaint against this rate was made by the Holland Furnace Co.

Electric hoist orders in December reported by members of the Electric Hoist Manufacturers' Association increased nearly 22 per cent over the previous month in number and nearly 20 per cent in value. Shipments were 26.5 per cent less in December than in November.

NON-FERROUS METAL MARKETS

The Week's Prices Cents per Pound for Early Delivery	Jan. 17	Jan. 16	Jan. 14	Jan. 13	Jan. 12	Jan. 11
Lake copper, New York....	14.25	14.25	14.25	14.25	14.25	14.25
Electrolytic copper, N. Y.*..	13.87½	13.87½	13.87½	13.87½	13.87½	13.87½
Straits tin, spot, N. Y.	54.25	54.87½	....	55.20	55.62½	56.25
Lead, New York...........	6.50	6.50	6.50	6.50	6.50	6.50
Lead, St. Louis............	6.30	6.30	6.30	6.30	6.30	6.30
Zinc, New York............	5.97½	5.97½	5.97½	5.97½	6.00	6.00
Zinc, St. Louis............	5.62½	5.62½	5.62½	5.62½	5.65	5.65

*Refinery quotation; delivered price ¼c. higher.

New York, Jan. 17.—None of the markets is particularly active. The price tendency is fairly steady in all but tin. In the face of small demand, copper prices hold firm. Sales of tin have been fairly heavy at the lowest prices in many months. Conditions in lead are unchanged, and the zinc market is a little softer.

Copper.—Very light demand both at home and abroad has been the history of the past week. Leading producers are all adhering to 14.12½c., delivered in the Connecticut Valley, and it is not possible to buy any large quantity of copper lower than this level. There have been a few sales of small quantities of electrolytic copper at around 14.05c. to 14.07½c., delivered, but the business has not been sufficient to establish a market. In fact, the general situation is such that prices are largely nominal. Copper Exporters, Inc., maintains its official quotation unchanged at 13.50c., c.i.f. usual European ports. There have been more inquiries for Lake copper today than yesterday and the quotation is unchanged at 14.25c., delivered. Statistics for December showed an increase in stocks of refined metal of about 4400 tons. The feature of the statistics was the exports for the month. At about 63,600 tons the total was the largest on record.

Tin.—Rapidly falling prices in spot Straits tin the past week have brought the quotation, which was 54.25c., New York, today, to the lowest price since May 19, 1925. Sales have been moderately heavy, the total for the week ended Friday, Jan. 13, having been 1300 tons, with 150 tons sold on Saturday. The cause of the decline is that stocks are heavy in many large centers of the world so that the technical situation has been weakened. As a result, sentiment is very bearish. Yesterday and today the market has been only moderately active, with 250 and 200 tons sold on each day respectively. In last week's sales, consumers were the principal buyers, dealers being disheartened at the decline in prices. There has been no support to the market and many of the larger houses, here and in London, have been anxious sellers. Prices in London today were about £7 per ton less than a week ago, with spot standard quoted at £247, future standard at £246 5s. and spot Straits at £247. Arrivals thus far this month have been 2945 tons, with 6500 tons reported afloat.

Lead.—The market is quiet and unchanged. No inquiries of magnitude are reported. Late last week consuming demand revived temporarily. The leading interest continues to quote 6.50c., New York, as its contract price, with the price in the outside market at 6.30c., St. Louis.

Zinc.—Demand is so light that quotations are nearly nominal and are a little lower than a week ago, at 5.62½c., St. Louis, or 5.97½c., New York, for prime western for early delivery. Consumers are fairly well covered for their nearby requirements. Stocks of ore in the Joplin district at over 51,000 tons on Jan. 1 were the largest ever recorded. Despite this, production for the week ended last Saturday was 12,000 tons, with sales about 8100 tons. The price stands at $36 per ton, the same as the previous week. When prime western touched 5.60c., St. Louis, late last year, ore was at $33 per ton.

Nickel.—Ingot nickel in wholesale lots is quoted at

Metals from New York Warehouse

Delivered Prices Per Lb.

Tin, Straits pig	56.50c. to 57.50c.
Tin, bar	58.50c. to 59.50c.
Copper, Lake	15.25c.

Brass, light	6.00c.	7.50c.
Heavy machine composition	9.50c.	10.75c.
No. 1 yellow brass turnings	7.75c.	8.75c.
No. 1 red brass or composition turnings	8.75c.	9.75c.
Lead, heavy	5.25c.	5.625c.
Lead, tea	4.25c.	4.75c.
Zinc	3.75c.	4.25c.
Sheet aluminum	12.75c.	14.50c.
Cast aluminum	12.75c.	14.50c.

35c., with shot nickel at 36c. and electrolytic nickel at 37c. per lb.

Antimony.—The market is quiet and Chinese metal for spot delivery is quoted at 11c., with futures at 11.25c., New York, duty paid.

Aluminum.—Virgin metal, 98 to 99 per cent pure, in ingots, is quoted at 23.90c., delivered.

Non-Ferrous Metals at Chicago

CHICAGO, Jan. 17.—Prices in this market are steady except in tin. Sales of copper are in fair volume. The old metal market is quiet and prices are holding at the levels of last week.

Prices, per lb., in carload lots: Lake copper, 14.25c.; tin, 56.75c.; lead, 6.40c.; zinc, 5.75c.; in less-than-carload lots, antimony, 12.50c. On old metals we quote copper wire, crucible shapes and copper clips, 10c.; copper bottoms, 9c.; red brass, 9c.; yellow brass, 6.75c.; lead pipe, 5c.; zinc, 3.50c.; pewter, No. 1, 34c.; tin foil, 43.50c.; block tin, 52c.; aluminum, 12.50c.; all being dealers' prices for less-than-carload lots.

REINFORCING STEEL

Chicago Building Will Take 3000 Tons—New Inquiries Total 7900 Tons, and Awards 5400

Including 1900 tons for subway work in New York and 1200 tons for a sewer at Akron, Ohio, last week's awards amounted to 5400 tons. Outstanding in the 7900 tons added to pending work was a canning building in Chicago which will require 3000 tons. Awards follow:

NEW YORK, 1000 tons, section of subway; from Arthur A. Johnson Corporation, general contractor, to Igoe Brothers.

NEW YORK, 400 tons, two sections of subway, 200 tons from Atwell, Gustin & Morris, general contractors, and 200 tons Moranti & Raymond, Inc., contractor, to Concrete Steel Co.

BROOKLYN, 500 tons, section of Chase Street subway; from Carleton Co., general contractor, to McClintic-Marshall Co.

WAMPAUM, PA., 300 tons, State highway bridge, to Truscon Steel Co.

AKRON, OHIO, 1200 tons, sewer work, to Concrete Steel Co.

CHATTANOOGA, TENN., tonnage being estimated, Fort Wood apartment building, to Connors Steel Co.

CHATTANOOGA, TENN., tonnage being estimated, Read creamery plant, to Connors Steel Co.

BIRMINGHAM, tonnage being estimated, Kennedy school, to Connors Steel Co.

LANCASTER, S. C., tonnage being estimated, filtration plant, to Connors Steel Co., Birmingham.

NEW ORLEANS, tonnage being estimated, addition to Poydras Street docks, to Connors Steel Co.

CHICAGO, 450 tons, Kelly public school, to an unnamed bidder.

AUSTIN, ILL., 100 tons, Post Office building, to Olney J. Dean & Co.

COOK COUNTY, ILL., 160 tons of rail steel bars for road work, to Calumet Steel Co.

EVANSTON, ILL., 100 tons of rail steel bars, Pembridge apartment hotel, to American System of Reinforcing.

ELLENSBURG, WASH., 835 tons, North Branch canal project, United States Bureau of Reclamation, to unnamed interest.

ALAMEDA, CAL., 250 tons, factory for N. Clark & Sons, to Badt-Falk Co.

SAN FRANCISCO, 100 tons, arena, Post and Steiner Streets, to local jobber.

Reinforcing Bars Pending

Inquiries for reinforcing steel bars include the following:

NEW YORK, 250 tons, Chevrolet garage and service station at Fifty-sixth Street and Eleventh Avenue; general contract to Turner Construction Co.

CAMDEN, N. J., 900 tons, building for Camden Cold Storage Co.

PHILADELPHIA, tonnage unstated, piers for Tacony-Palmyra bridge.

PHILADELPHIA, 300 tons, building for Army and Navy Y. M. C. A.

PHILADELPHIA, 350 tons, building for Abingdon Hospital.

CLEVELAND, 745 tons, Whitehouse crossing grade elimination.

WHITE PLAINS, N. Y., 200 tons, community building for Westchester County Park Commission.

BOSTON, 100 tons, stores on Newbury Street.

BUFFALO, 125 tons, school No. 47; being figured.

BUFFALO, 150 tons, stadium for Buffalo high schools; plans being prepared.

ROCHESTER, N. Y., 180 tons, State hospital; bids closed Jan. 18.

CHICAGO, 3000 tons, building for Campbell Soup Co.; Henry Ericsson, general contractor.

CHICAGO, 100 tons, Women's Athletic Club; Phillip Maher, architect.

CHICAGO, 186 tons, office building at Washington Boulevard and LaSalle Street.

CHICAGO, 600 tons, Passavant Hospital; Holabird & Roche, architects.

EVANSTON, ILL., 200 tons, Boltwood public school.

EVANSTON, 300 tons, apartment building at corner of Hinman Avenue and Grove Street.

SAN FRANCISCO, 475 tons, merchant bars and bands for Pacific Fruit Express Co.; bids in.

Improvements in Ferrous Sintering

(Concluded from page 193)

content. They also serve to make the charge more porous and to provide the necessary binder to the material, thus preventing an excessive amount of material being drawn through the grates by suction. No special attempt is made to place a protection or hearth layer on the grates, except that, in distributing the material on the grates, it is so baffled against a forged screen that the coarser particles of returns are screened out and roll down on the grates ahead of the flue dust.

Daily production of the plant described averages about 800 tons of sinter, which may well be considered a good performance, especially as custom sintering is subject to many circumstances not present in privately operated plants.

Although it is not possible to present the exact cost figures of the plant in question, they will not vary materially from the table. The figures represent cost in cents per ton of sinter, based on favorable conditions.

PERSONAL

W. G. Maguire, since 1923 president of the St. Louis Gas & Coke Corporation, St. Louis, has resigned and will be succeeded by M. D. Curran, who has been vice-president, general manager and a director. Mr. Maguire will remain a director of the company but will devote his time to the Utilities Power & Light Corporation, of which the Gas & Coke corporation is a subsidiary. He has been associated with the latter company and its predecessors since 1916, having previously been manager of the St. Louis branch of the Domhoff & Joyce Co., Cincinnati. Mr. Curran went to the St. Louis company in 1923 as general superintendent of operations at Granite City, Ill. In 1925 he became vice-president in charge of operations, and the following year, vice-president and general manager. He was actively in charge of the building of the company's second blast furnace and its electric power plant in 1926, and has also been prominently identified with other large engineering projects relating to the gas and light activities of the parent company and its other subsidiaries. Mr. Curran, who is not yet 35 years of age, was born at New Straitsville, Ohio, and was graduated from the Corning, Ohio, high school. He entered the department of mining and metallurgical engineering at Ohio State University in 1909 and, during the summer months of his college years, worked in the coke ovens of the Connellsville district. He also withdrew from the college for a year to work in the ore mining properties of the Republic Iron & Steel Co. in the Mesabi range. He returned to the Republic company, following graduation from Ohio State University in 1914, as burden clerk at the Hazleton furnaces, Youngstown. In less than a year he was made chief chemist of the company's coke plant. In 1916 he became assistant coke oven superintendent for the Toledo Furnace Co., Toledo, Ohio, and two years later was made superintendent of its coke oven plants. In 1920 he became assistant general superintendent of the company's complete operations, holding that position until he went with the St. Louis company in 1923. He has been a director and vice-president of the St. Louis Coal & Iron Co., the company's coal mining subsidiary, and now assumes the presidency of that company. It is understood that Mr. Curran plans to move the general offices of the Gas & Coke corporation back to St. Louis from Chicago where they were taken about a year ago.

W. G. MAGUIRE

M. D. CURRAN

—

Joseph B. Deisher, 24 Roslyn Street, Rochester, N. Y., has been appointed by the American Foundrymen's Association as representative of the malleable foundry industry on an advisory committee to the Department of Commerce. He is one of the three representatives of the iron and steel industry on this committee who are available to the department for consultation and advice concerning their respective branches of the industry. Mr. Deisher for a number of years was connected with the Symington Co., Rochester, and later was associated with the engineering department of the Malleable Iron Research Institute at Albany, N. Y. He recently returned from Europe, where he represented the American Radiator Co. as a specialist on foundry work. Since then he has been engaged in general consulting practice on gray iron foundry work.

—

H. F. T. Erben, assistant vice-president of the General Electric Co., retired on Jan. 1, after more than 40 years of service with that company. At the time of his retirement he was also vice-chairman of the General Electric manufacturing committee. B. L. Delack has been appointed manager of the Schenectady, N. Y., plant of the General Electric Co., and E. A. Wagner has been made manager of its Pittsfield, Mass., plant. C. N. Gregory has been named manager of the New Haven, Conn., sales office, succeeding Frederic Cutts, and R. B. Ransom has been appointed resident agent in charge of the Hartford, Conn., office, succeeding Mr. Gregory.

—

Charles A. Fisher, since last April president of the Jones & Laughlin Steel Corporation, Pittsburgh, has resigned. A desire to retire from active business is Mr. Fisher's reason for severing a connection that began in 1898. He was then 22 years old and started with the company as a bookkeeper, successively serving as assistant auditor, assistant treasurer, treasurer, assistant to the president and, before his election to the presidency, as vice-president in charge of finances. For 10 years he was closely associated with the late William Larimer Jones, whom he succeeded as president of the company.

—

James R. White, for nine years vice-president of Rickard & Co., New York, industrial advertising agency, on Jan. 1 became secretary of Jenkins Brothers, 80 White Street, New York, valve manufacturers. During his association with the Rickard organization Mr. White was in charge of the direction of Jenkins advertising. Associates in Rickard & Co. tendered Mr. White a testimonial dinner at the Hotel Vanderbilt, New York, on Dec. 30.

—

G. A. Roush has received a leave of absence from the metallurgical faculty of Lehigh University, Bethlehem, Pa., and will devote his time to the development and gathering of exhibits on mining and metallurgy for the Museums of Peaceful Arts, New York. He is open to suggestions concerning suitable materials or models showing industrial progress in ore smelting and metal working.

—

E. K. Swigart has been elected chairman, and H. M. Swigart, president of the Oilgear Co., Milwaukee.

—

Charles H. Leinert, president of the Leinert Valve Co., Inc., 310 South Michigan Avenue, Chicago, has been appointed district representative in that city for the Birdsboro Steel Foundry & Machine Co., Birdsboro, Pa.

—

Horace C. Knerr, consulting metallurgical engineer, Philadelphia, will address the Cleveland chapter, American Society for Steel Treating, on "Aircraft Metallurgy," Friday evening, Jan. 20.

—

Lon Sloan has been placed in charge of a district sales office recently opened at 223 Railway Exchange Building, Chicago, by the Hendrick Mfg. Co., Carbondale, Pa., manufacturer of steel grating, stair treads and kindred products.

—

Samuel Porcher, assistant vice-president in charge of purchases, stores and insurance for the Pennsylvania Railroad, has retired from active service under the company's pension regulations. He has been in the railroad's service for 46 years.

T. G. McDougal has been appointed vice-president in charge of spark plug ceramic development for the AC Spark Plug Co., Flint, Mich., and will also have supervision over the company's foreign plants at Birmingham, England, and Paris.

—

John F. Edgerton, president of the National Association of Manufacturers, will be the principal speaker at a meeting of the Central Illinois Unit in Decatur, Ill., Jan. 27, at which manufacturers, bankers and representatives of commercial associations will be guests.

—

F. M. Kimball has been appointed advisory manager, and J. E. N. Hume, manager, of the motor division of the industrial department, recently created by the General Electric Co., Schenectady, N. Y. The new division will have general supervision of all motors handled by the company's industrial department. K. H. Runkle has been appointed manager of mining and steel mill sales, succeeding Mr. Hume. These appointments were effective Jan. 1.

—

T. C. Crosby, formerly in the Tulsa, Okla., office of the Graver Corporation, East Chicago, Ind., has been placed in charge of the sale of tanks and steel plate equipment in the new office which has been opened by the company at 201 Petroleum Building, Fort Worth, Tex. H. E. Clark, recently in the company's Houston, Tex., office, will handle sales of refinery equipment, and C. J. Hutcheson, who has been in the home office, will be in charge of water softening and filtering equipment sales at Fort Worth.

—

Joseph Zubaty, who has been in charge of speedometer and other instrument development of the AC Spark Plug Co., Flint, Mich., for a number of years, has been appointed chief engineer of the company. Before becoming associated with the AC company, Mr. Zubaty was chief engineer of the H. & M. Farman Co., Paris, a leading French airplane manufacturer, and was prominent in the development of the Farman airplane and automobile engines. He is a graduate of Prague University in Czechoslovakia.

—

J. M. Telford has been made sales manager in Illinois for the Austin Western Road Machinery Co., Chicago, and will have headquarters at Springfield. He has represented the company in the upper peninsula of Michigan for a number of years.

—

L. F. Rains has been appointed acting general manager of the Columbia Steel Corporation, San Francisco, succeeding H. D. Botchford, who recently resigned on account of ill health. Mr. Rains was formerly manager for the corporation at Salt Lake City, Utah.

—

G. H. Hutchins, who has been in active charge of all sales of coke for foundry, industrial and domestic consumption of the Semet-Solvay Co., New York, has resigned.

—

W. A. Riddell, president W. A. Riddell Co., Bucyrus, Ohio, maker of road and clay machinery, and president of the Frederick Iron & Steel Co. and the Frederick Engineering Co., Frederick, Md., makers of centrifugal pumps, has been elected a director of the Engineers National Bank of Cleveland.

—

N. McE. Sage, of the Raytheon Co., Cambridge, Mass., has been elected president of the Atlas Tack Corporation to succeed W. E. Maxson, who has resigned.

—

Charles A. Roberts, plant superintendent of the Gurney Heater Mfg. Co., Framingham, Mass., has resigned. He has been succeeded by M. L. Doelman, formerly with the Union Radiator Co., Johnstown, Pa.

—

Julian A. Pollak, vice-president Pollak Steel Co., Cincinnati, has been re-elected president of the Cincinnati River-Rail Transfer Co., which owns and operates a terminal at Cincinnati for the transfer of freight from Ohio River barges to railroad cars or motor trucks.

—

Col. George G. King has been elected president of the Peters Cartridge Co., Cincinnati, manufacturer of ammunition, succeeding W. E. Keplinger, who recently resigned. Colonel King has been identified with the company since its organization and for a number of years has been works manager and a member of the board of directors.

—

Carl H. Casberg, for the last two years superintendent of the machine laboratory at the University of Illinois, has been made manager of the shop laboratories at the university, the appointment to be effective Feb. 1. He succeeds the late Bruce W. Benedict. Mr. Casberg was graduated from the University of Wisconsin in 1916.

—

Edward L. Leeds, formerly vice-president and director of the Niles-Bement-Pond Co. and vice-president of Pratt & Whitney Co., and Brent A. Tozzer, until recently New York sales manager for the Niles Tool Works Co. and the Pratt & Whitney Co., have engaged in business under the name of Leeds Tozzer & Co., Inc., and have taken offices at 75 West Street, New York. They will specialize in machinery engineering work and will represent manufacturers of heavy machinery. Both have had long experience in the machine tool industry.

—

Fred H. Oberschmidt has been appointed manager of the Pacific Coast district office of the Cutler-Hammer Mfg. Co., Milwaukee. His headquarters will be at 970 Folsom Street, San Francisco.

—

Flavel M. Woodworth and Eugene F. LaPorte, employees of the Pratt & Whitney Co., Hartford, Conn., were recently honored by the company for their long terms of service. Mr. Woodworth has completed his sixtieth year of continuous service. He started as an apprentice and has been employed in the planer department for 40 years. Mr. LaPorte, who has been with the company for 50 years, began as a messenger boy, and in later years has been a special messenger for the company.

—

William W. Dodge has been appointed sales representative in western New York for the C. O. Bartlett & Snow Co., Cleveland, and will have his headquarters at Warsaw, N. Y. After graduation from Cornell University he served an apprenticeship in the shops of the Dodge Mfg. Co., Mishawaka, Ind., and was subsequently associated with that company in various capacities, having been for some years vice-president and Chicago district manager. Recently he has devoted his time to the design and sale of material handling equipment.

—

F. X. Devlin, recently purchasing agent for the Federal Motor Truck Co., has been made district sales manager at Chicago for the H. C. Atkins Mfg. Co., St. Louis, and will have charge of the company's pipe nipple sales in northern Indiana, northern Illinois, western Michigan, Wisconsin and Minnesota.

—

Robert W. Bier has been placed in charge of the Chicago office of the Erie Ball Engine Co., Pittsburgh, at 1540 Monadnock Block. He is a graduate of the Carnegie Institute of Technology and has been identified with the Erie company for several years in both the sales and engineering departments.

—

G. S. Carrick, lately president and general manager of the Carrick Engineering Co., Chicago, has been appointed general manager of the industrial department of the American Arch Co., Inc., New York, and will have charge of matters relating to the company's furnace products. After graduation in 1909 from Purdue University, Lafayette, Ind., he served in the power plant and industrial sales departments of the Westinghouse Electric & Mfg. Co., East Pittsburgh. In 1913 he entered the combustion engineering field, engaging particularly in power plant work, later organizing the Carrick company, which specialized in the automatic control of combustion for boiler plants and furnaces.

Eugene G. Grace, president Bethlehem Steel Corporation, will be the principal speaker at the annual banquet of the Engineers Society of Western Pennsylvania at the William Penn Hotel, Pittsburgh, Monday evening, Jan. 30. His talk will be on the need of broader business training for engineers.

S. W. Utley, president American Foundrymen's Association and vice-president Detroit Steel Casting Co., was the speaker at the regular monthly meeting and dinner of the Pittsburgh Foundrymen's Association at the Fort Pitt Hotel, Pittsburgh, on Jan. 16. His subject was "Why Initiative Deserves Profit."

T. M. Girdler was elected president of the Jones & Laughlin Steel Corporation, Pittsburgh, at a meeting of the board of directors held on Jan. 12. At the same meeting W. J. Creighton was made a vice-president and director of the company, and W. C. Robinson, a director. William D. Evans and William L. Jones, Jr., were elected to the executive committee, and W. H. Dupka, who has been assistant comptroller, was made comptroller and assistant secretary. These changes are incident to the death of B. F. Jones, Jr., chairman of the board, whose place, it was said following the meeting, will probably remain vacant until the annual meeting of the corporation in April. The new president was graduated in mechanical engineering from Lehigh University, Bethlehem, Pa., in 1901, and immediately became associated with the Buffalo Forge Co., Buffalo, N. Y. Shortly afterwards he was sent to London, England, as sales engineer and assistant to that company's London representative. In 1902 he returned to this country to become identified with the Oliver Iron & Steel Corporation, Pittsburgh, remaining with that company until 1905, when he went with the Colorado Fuel & Iron Co., Pueblo, Colo. Two years later he became general superintendent of the Atlantic Steel Co., Atlanta, Ga., remaining with that company until 1914, when he joined the Jones & Laughlin company as assistant to the general superintendent of the Aliquippa works, Woodlawn, Pa. Later he was successively assistant general superintendent and general superintendent of that works and general manager of all plants and properties of the company. Two years ago he was elected vice-president in charge of operations and a director and, a year ago, was made a member of the executive committee. W. C. Robinson, the new director, is president of the National Metal Molding Co. and a director of the Mellon National Bank and the Union Trust Co., Pittsburgh. Mr. Creighton, the new vice-president, has been with the corporation since 1900 and for several years has been its comptroller.

T. M. GIRDLER

Stanley P. Rockwell, president of the Stanley P. Rockwell Co., Hartford, Conn., spoke before the Providence Engineering Society on Jan. 18, his subject being the "Rockwell Dilatometer and the Volcrit Method of Heat Treatment."

Walter C. Kimball, for two and a half years vice-president in charge of sales for the International Heater Co., Utica, N. Y., has resigned to become associated with William A. White & Sons, real estate agents, 45 Cedar Street, New York.

Arthur C. Pletz has been appointed sales manager of the Niles Tool Works Division of the Niles-Bement-Pond Co., with headquarters at Hamilton, Ohio. For nearly two years Mr. Pletz has been in charge of the miscellaneous tool department at Hamilton, and before that was general manager of the Morris Machine Tool Co., Cincinnati.

Joseph A. Janney, Jr., has purchased the interest of Joseph A. Steinmetz in the firm of Janney-Steinmetz & Co., Philadelphia, engineers. With the dissolution of the partnership the business will be conducted under the name of Joseph A. Janney, Jr.

Carl F. Dietz, president, and Robert T. Kent, general manager, of the Bridgeport Brass Co., Bridgeport, Conn., have resigned. Ralph Day, manager of the Hastings plant of the American Brass Co., Hastings-on-Hudson, N. Y., has been appointed general manager of the Bridgeport company, but a new president has not been selected. Mr. Day had been associated with the American Brass Co. for 22 years, and before going to the Hastings plant about five years ago, was in charge of the company's Waterbury, Conn., branch.

J. W. Berscheld, for the last three years superintendent of the Scott Street plant at Joliet, Ill., of the American Steel & Wire Co., has been made superintendent of both the Scott and Rockdale plants of the company. At the Rockdale works he succeeds H. R. Patterson, whose transfer to the superintendency of the Rankin and Braddock, Pa., works of the company, was mentioned in THE IRON AGE last week. Mr. Berscheld's appointment marks the final step in the consolidation of the Steel & Wire company's Joliet plants which was begun three years ago by the merging of their accounting departments.

J. Frank Rogers has resigned as manager of the gas producer division of the Wellman-Seaver-Morgan Co., Cleveland, and has been succeeded by Victor Windett, who has been engineer of that division since 1917. Mr. Rogers had been with the company since 1901.

J. G. Stromp, formerly general manager of sales for the J. E. Moss Iron Works, Wheeling, W. Va., has become associated with the Pittsburgh Screw & Bolt Corporation, Pittsburgh, and will be attached to its New York sales office.

Edward L. Ryerson, Sr., chairman of the board of Joseph T. Ryerson & Son, Inc., is critically ill at his home, 38 Banks Street, Chicago.

M. L. Mozier has temporarily withdrawn from the active direction of pig iron sales of the Hudson Valley Coke & Products Corporation, Troy, N. Y., on account of the illness of Mrs. Mozier.

E. J. Lowry, metallurgist Hickman, Williams & Co., New York, addressed the Connecticut Foundrymen's Association on the metallurgy of pig iron at Meriden, Conn., Jan. 13.

Form Large Engineering and Construction Firm

United Engineers & Constructors, Inc., has been formed by a combination of the United Gas Improvement Contracting Co., Philadelphia; the Public Service Production Co., Newark, N. J.; Dwight P. Robinson & Co., Inc., New York, and the Day & Zimmermann Engineering & Construction Co., Philadelphia. Dwight P. Robinson will be president of the new corporation, which will have its principal office at Broad and Arch Streets, Philadelphia. The company will maintain branch offices in many cities of North and South America, and will participate in all forms of engineering and construction activity.

Machinery Markets and News of the Works

MARKETS MORE ACTIVE

Agricultural Machinery and Automobile Parts Makers Buy Tools

Price Advances on Certain Lines of Machinery Have Stimulated Recent Placing of Orders

AGRICULTURAL machinery manufacturers in the Chicago district and makers of automobile parts in the Michigan-Ohio territory have been more active in machine tool markets in the past week, resulting in an increase in the volume of sales. A tractor manufacturer in central Illinois bought about $200,000 worth of new equipment, while other farm machinery manufacturers have bought in smaller lots. The International Harvester Co. has enlarged its replacement program at its McCormick plant in Chicago and a Milwaukee road machinery company has prepared a large list of tool requirements.

The Cleveland and Detroit markets have been stimulated by the present activity among manufacturers of automobile parts, most of the plants in that field now operating at capacity. Some business in small lots has been placed by automobile companies in Detroit.

From Cincinnati comes the report that sales dropped off in the past week, but inquiries are numerous and machine tool builders are of the opinion that sales during this quarter will attain fairly liberal proportions. The largest order reported from Cincinnati is 10 18-in. lathes bought by an Ohio wheel manufacturer.

Some of the recent ordering has resulted from price advances, buyers taking advantage of the opportunity to act upon outstanding quotations at the former prices. A Cleveland manufacturer of turret lathes reports a heavy volume of single machine orders, largely from the New York and Chicago territories, following the recent announcement of a 10 per cent price advance.

The National Machine Tool Builders' Association reports that December was the best month of 1927 for net orders. The business for the entire year was about 85 per cent of the 1926 volume. "General opinion," says the association's report, "is that 1928 will see a greater volume of business than 1927."

New York

NEW YORK, Jan. 17.

THERE has been a fair volume of inquiry since the beginning of the month, so that prospective business is considered good. Mergenthaler Linotype Co., Brooklyn, continues as a purchaser of machine tools and equipment. In making changes from belt to motor drive in its shops the company is reported to have ordered more than $85,000 worth of electrical equipment. Purchases of tools have thus far included six turret lathes and a number of engine lathes, and two milling machines are about to be placed. General Electric Co., Schenectady, N. Y., is reported in the market for five tools for Pittsfield and two for Schenectady.

Inquiry from railroads is confined to the list reported last week from the Delaware, Lackawanna & Western. New York Central has not been purchasing recently and is not expected to be in the market again for several weeks. The list of the Delaware, Lackawanna & Western includes the following: For East Buffalo, a 42-in. sizing shear, wheel press recording gage, and 50-ton drop table; for Utica, N. Y., motor-driven floor grinder; for Keyser Valley, Pa., an 18-in. riveting machine, rotary pump, hose dismounting machine and 30-in. engine lathe; for Scranton, Pa., motor-driven floor grinder, 50-ton bushing press, 54-in. horizontal milling machine, 50-ton hydro-pneumatic forcing press, 32-in. vertical turret lathe, two 16-in. engine lathes, 13 x 16-in. hack saw, 4-ft. radial drill, 14-in. sensitive drill, 20-in. engine lathe, band saw, flexible shaft grinder, nibbling machine, spring testing machine, 8000-lb. steam hammer, sand separator and swing frame grinder; for Kingsland, N. J., 42-in. vertical turret lathe, 10 x 36-in. universal grinder and double axle lathe; for Hoboken, N. J., slitting shear.

Recent purchases have included a used Pratt & Whitney thread milling machine and used cutter grinder by a company in Chicago; Stanley No. 2 drill by Boston & Maine Railroad; shop-worn, 6-ft. Niles universal radial drill by an iron company in Pennsylvania; two Ransom R. W. grinders by a company in Rochester; a No. 1 deep-hole drilling machine by an automobile manufacturer in Detroit, and a 16 x 60-in. Pratt & Whitney lathe by a Cleveland manufacturer. Niles Tool Works Co. recently purchased three 20 x 72-in. and two 20 x 96-in. lathes from Pratt & Whitney Co. Sperry Gyroscope Co., Brooklyn, and Ludlow Valve Mfg. Co., Troy, N. Y., recently purchased turret lathes.

Brooklyn Union Gas Co., 176 Remsen Street, Brooklyn, N. Y., has plans for a four-story gas producer plant, 55 x 160 ft., at 396-98 Gardner Avenue, to cost $500,000 with machinery.

John J. Dunnigan, 2382 Grand Concourse, New York, architect, has begun erection of two-story automobile service, repair and garage building on Webster Avenue, to cost about $150,000 with equipment.

Simmons Machine Tool Co., Albany, N. Y., has acquired former plant of General Railway Signal Co., on adjoining site for expansion.

Plattsburg Power & Electric Co., Plattsburg, N. Y., has purchased hydroelectric generating plant of Peck Brothers, textile manufacturers, Shushan, N. Y., and plans expansion in that section, including transmission line construction.

C. J. Wolf, 2 Crary Street, Mount Vernon, N. Y., architect, has plans for one and two-story automobile service, repair and garage building, to cost close to $100,000 with equipment.

Indian Refining Co., 17 State Street, New York, operating an oil refinery at Lawrenceville, Ill., with capacity of 15,000 bbl. per day, is disposing of a bond issue of $1,600,000, a portion of proceeds to be used for expansion.

William Shary, 41 Union Square, New York, architect, will soon begin construction of six-story automobile service, repair and garage building at 310 West Thirty-ninth Street, to cost close to $200,000 with equipment.

Board of Education, Valley Stream, N. Y., is considering installation of manual training equipment in four-story high school to cost $250,000. Fred Wiedersum is architect for board.

United Electric Light & Power Co., 130 East Fifteenth Street, New York, has purchased entire block of property on Harlem River, adjoining its generating plant at 201st and Academy Streets, for future expansion.

Elevating and conveying machinery, power and other equipment will be installed in two-story storage and distributing plant, 115 x 202 ft., to be erected by United Grocers Co., Inc., 7981 Clifton Place, Brooklyn, at Evergreen, L. I., to cost $160,000. Allmendinger & Schlendorf, 852 Monroe Street, Brooklyn, are architects.

Mohawk-Hudson Power Corporation, Albany, N. Y., will acquire Schodack Light & Power Corporation, Castleton,

The Crane Market

THERE is an increasing number of overhead crane inquiries in the market, but purchasing has not yet developed to any extent. Business in locomotive cranes is still quiet. The Public Service Production Co., Newark, N. J., which has been inquiring for a 120-ton overhead crane for Roseland and a 65-ton crane for West Orange, N. J., has asked for bids on a 120-ton crane for Metuchen, N. J. The 13 cranes for the West Philadelphia plant of the General Electric Co., reported placed last week, are understood to have been distributed as follows: Four 2-ton traveling wall cranes to the Box Crane & Hoist Corporation, three 10-ton electric overhead cranes to the Niles Crane Corporation, nine 5-ton underhung electric cranes to the Northern Engineering Works and one 5-ton overhead crane to the Milwaukee Electric Crane & Mfg. Corporation. At an opening of bids by the Government of Porto Rico on a 15-ton, 24-ft. span electric crane, the low bid was submitted by the Box Crane & Hoist Corporation.

Among recent purchases are:

E. L. Phillips & Co., 50 Church Street, New York, 10-ton hand power crane for Long Island Lighting Co., from New Jersey Foundry & Machine Co.

Turbine Equipment Co., 30 Church Street, New York, 3-ton, 24-ft. span hand power crane from Box Crane & Hoist Corporation.

Norfolk & Western Railway Co., Roanoke, Va., 15-ton, 78-ft. span and 10-ton, 18-ft. span, overhead electric cranes from Niles Crane Corporation.

Midland Barge Co., Pittsburgh, 40-ton electric gantry crane from Orton Crane & Shovel Co.

Weil-McLain Co., Michigan City, Ind., three 5-ton and one 7½-ton electric cranes from Erie Steel Construction Co.

Carnegie Steel Co., Pittsburgh, 10-ton, 46-ft. span, magnet handling crane for its Edgar Thomson works, from Alliance Machine Co.

N. Y., and consolidate with system. Plans are under consideration for expansion in last noted district, including transmission lines.

Lexington Electric Products Co., 419 East Twenty-fourth Street, New York, manufacturer of switchboards, electric panels, etc., has acquired the two and three-story factory at 6-26 Chapel Street, Newark, and will remodel for a new plant. An additional unit will be erected to increase floor area to 75,000 sq. ft.

W. P. Katz, 2 Hudson Street, Yonkers, N. Y., architect, is completing plans for a two-story automobile service, repair and garage building, 75 x 100 ft., to cost $200,000 with equipment.

Atlantic Cement Products Co., Hicksville, L. I., has begun erection of new plant, to cost about $200,000 with conveying, hoisting, loading and other machinery.

Public Service Electric & Gas Co., Terminal Building, Newark, plans construction of a three-story power substation at New Brunswick, N. J., to cost close to $90,000 with equipment.

Municipal Council, Belleville, N. J., has plans for a one-story repair shop, to cost more than $25,000 with equipment. Paul B. West, 24 Commerce Street, Newark, is architect.

Samuel H. Kulman and James Moran, Newark, have leased space in new building at Frelinghuysen Avenue and Empire Street, totaling 115,000 sq. ft., for plant to manufacture lunch wagons and dining cars.

Dominick & Haff, Inc., and McChesney Co., both at 144 Orange Street, Newark, manufacturers of plated and silverware products, flat ware, etc., have merged with Reed & Barton Corporation, Taunton, Mass., manufacturer of kindred products. Present plants will be continued and expansion carried out.

Clinton B. Cook, Asbury Park Trust Building, Asbury Park, N. J., architect, has filed plans for a four-story automobile service, repair and garage building, 100 x 150 ft., to cost approximately $225,000 with equipment.

Combustion Utilities Co. 60 Wall Street, New York, manufacturer of power plant and furnace equipment, etc., has awarded general contract to Austin Co., for initial building of new plant at New Brunswick, N. J., 50 x 125 ft., to cost upward of $75,000 with equipment.

Huff Airplanes, Inc., 497 Division Street, Perth Amboy, N. J., Ira R. Crouse, treasurer, has begun foundations for a one-story unit at its proposed plant on portion of tract of Pardee Steel Corporation, 190 x 260 ft., to cost more than $80,000 with equipment.

Hygienic Tube Co., 88 McWhorter Street, Newark, manufacturer of composition, mechanical and other tubing, has revised plans for a new plant at Avenue L and Mary Street, 100 x 100 ft., reported to cost about $45,000 with equipment. Alfred Peter, 207 Market Street, is architect.

M. K. Frank, 15 Park Row, New York, has been inquiring for a narrow gage mine locomotive, saddle tank, steam-driven.

Gabrieleen Co., Inc., 245 Fifth Avenue, New York, has been formed to take over Gabriel Corporation and will manufacture hair waving machines and supplies. Company has factory in Newark, and arrangements have been made for purchase of materials.

Zoll-Roe Co., Inc., 150 Spring Street, New York, has been organized to manufacture tools, appliances and metal products. At present it is engaged in refinishing passenger and freight elevator cabs and dipping of handles and miscellaneous small products.

E. L. Phillips & Co., New York, have ordered from Semet-Solvay Engineering Corporation, New York, quantity of 16-in., 20-in. and 30-in. pipe and fittings with Van Stone flanges. Larger sizes of pipe will have seams electrically welded both inside and out.

Associated Machine Tool Co., 187-189 Seventh Street, Brooklyn, has changed its name to L. J. Hoy & Co. Company deals in new and second-hand machinery.

Wellman-Seaver-Morgan Co., Cleveland, has moved its New York office from 522 Fifth Avenue to 30 Church Street.

Long Island Lighting Co. will equip its plant at Bay Shore, N. Y., with Steere welded steel pipe and fittings.

Philadelphia

PHILADELPHIA, Jan. 16.

BIDS have been asked on general contract by Pennsylvania Railroad Co., Philadelphia, for a new cold storage and refrigerating plant to cost in excess of $150,000. Day & Zimmermann, Inc., Sixteenth and Walnut Streets, is engineer.

Tidewater Oil Sales Corporation, 11 Broadway, New York, is said to be arranging for construction of three-story storage and distributing plant, 65 x 105 ft., to cost upward of $60,000 with equipment.

Keystone Index Card Co., 3225-27 Race Street, Philadelphia, manufacturer of office equipment, has acquired adjoining property, 50 x 100 ft. and 50 x 175 ft., for expansion. It is said that present buildings on sites will be razed and factory extension built.

Day & Zimmermann, Inc., Sixteenth and Walnut Streets, Philadelphia, engineer, is asking bids until Jan. 31 for a boiler plant, pumping station, steel water tank and tower, and miscellaneous equipment for a State cantonment and utilities at Graterford, Pa., acting for Board of Trustees, Eastern State Penitentiary of Pennsylvania.

General Gas & Electric Co., 50 Pine Street, New York, is completing plans for a steam-operated electric power house at Holland, N. J. It will be operated under direction of New Jersey Power & Light Co., Dover, N. J., an affiliated organization, and will comprise two 42,000-kw. generating units, condensers, boilers, pumping machinery and accessory equipment. Work will begin early in spring. Project will cost more than $5,000,000, including transmission lines.

Roberts & Manders Stove Co., Eleventh Street and Washington Avenue, Philadelphia, has awarded general contract to Cameron Engineering Co., Fifteenth and Chestnut Streets, for a one-story addition to plant at Hatboro, Pa., to cost $45,000.

Dielectric Products, Inc., Wilmington, Del., care of John F. Porter, 1303 Franklin Street, recently formed under State laws by Mr. Porter and associates with capital of $100,000 and 10,000 shares common stock, no par value, has acquired property at Newport, near Wilmington, for a new plant to manufacture insulating greases and affiliated products used in production of high tension cables. Initial plant is reported to cost more than $75,000. J. E. Hammond is first vice-president; R. E. Glover, secretary, and Lewis Rumford, treasurer.

Harrisburg Light & Power Co., Harrisburg, Pa., is arranging an expansion and improvement program, including additions in power plants and transmission lines, to cost more than $1,000,000 with equipment.

Bureau of Supplies and Accounts, Navy Department, Washington, is asking bids until Jan. 24 for safety valves and spare parts for Philadelphia and Norfolk navy yards, schedule 8342.

Prest-O-Lite Co., 30 East Forty-second Street, New York, manufacturer of acetylene apparatus, subsidiary of Union

Carbide & Carbon Corporation, has acquired property at Harrisburg, Pa., for a one-story plant to cost $27,000, for which superstructure will begin at once. An adjoining portion of site will be used for one-story factory branch, 80 x 100 ft., for Linde Air Products Co., another subsidiary, manufacturer of industrial oxygen, etc., to cost more than $30,000. Both organizations are reported planning similar units at Allentown, Pa.

Board of Education, Altoona, Pa., has authorized purchase of property for a new West Side senior high school, for which plans will soon be drawn, to cost $800,000. Manual training department is being considered.

Buffalo

BUFFALO, Jan. 16.

BIDS have been asked on general contract by General Drop Forge Co., 1738 Elmwood Avenue, Buffalo, for one-story machine shop to cost $50,000, with adjoining department for shipping service. Ernest McGeorge, 3030 Euclid Avenue, Cleveland, is architect and engineer.

Buffalo Cement Co., Ltd., 110 Franklin Street, Buffalo, contemplates rebuilding portion of crushing plant destroyed by fire Jan. 10, with loss close to $75,000 including equipment.

Standard Milling Co., 49 Wall Street, New York, has plans for a new flour mill at Buffalo, to cost in excess of $200,000 with machinery. A. E. Baxter Engineering Co., Ellicott Square, Buffalo, is architect and engineer.

Curtiss Aeroplane & Motor Co., Inc., Kail Street, Buffalo, is arranging an expansion program for its affiliated organization, Curtiss Aeroplane Export Corporation, and has disposed of stock totaling about $500,000. C. M. Keys, president of parent company, is chairman of board of subsidiary organization; C. W. Webster, president; and J. A. B. Smith, treasurer.

Binghamton Airways, Inc., 140 State Street, Binghamton, N. Y., has been organized to manufacture and repair airplanes and aeronautical equipment. Company may erect hangar in near future. No contracts have as yet been let.

Detroit

DETROIT, Jan. 16.

CONTRACT has been let by Hupp Motor Car Corporation, 3641 East Milwaukee Avenue, Detroit, to Everett Winters, Inc., 1651 East Grand Boulevard, for one-story addition to cost about $65,000, for metal-stamping.

Zimmerman Mfg. Co., Owosso, Mich., manufacturer of turned wood products, has acquired a local plant formerly occupied by Sorg Engine Co., and will remove and expand its works at that location. Zimmerman company has lately disposed of its factory to Michigan Rubber Co., which will establish plant for production of hard rubber specialties.

Chris Smith & Sons Boat Co., Algonac, Mich., is completing an addition for marine engine manufacturer and will begin operations soon. Plant will be devoted to eight and six-cylinder motors, of 150 and 200 hp. rating, respectively. Company is arranging production schedule of about 1700 fast boats during 1928, and will develop other divisions of works on that basis.

Grand Rapids Gas Light Co., Grand Rapids, Mich., is arranging fund of about $300,000 for extensions and improvements in artificial gas plant and system, including additional equipment installation.

Warner Aircraft Co., 4042 West Jefferson Avenue, Detroit, is said to be planning installation of machine tools and other equipment.

New Way Motor Co., Lansing, Mich., will make extensions and improvements in plant, including re-tooling for production of a new type of gasoline engine, two-cylinder, non-vibrating. Works have heretofore been devoted to manufacture of single cylinder motors.

Linde Air Products Co., 30 East Forty-second Street, New York, manufacturer of industrial oxygen, welding apparatus, etc., has begun work on a new two-story plant, 48 x 98 ft., at Grand Rapids, Mich., to cost more than $45,000.

Cadillac Sales & Service Co., Wayne Street, Pontiac, Mich., has plans for a two-story service, repair and garage building, to cost $200,000 with equipment.

AC Spark Plug Co., Flint, Mich., will carry out an expansion program in spark plug and speedometer departments, utilizing space heretofore given over to tile manufacture. Company will also develop facilities for production of ammeters, oil gages, thermo gages and instrument panels for motor cars and motor boats.

Board of Education, Owosso, Mich., contemplates installation of manual training equipment in a new two-story high school to cost $165,000, for which plans will be drawn by William B. Ittner, 911 Locust Street, St. Louis, architect.

City Council, Fordson, Mich., has plans for a municipal power house in connection with a group of city buildings. John Kasurin, Empire Building, Detroit, is architect.

Kalamazoo Stove Co., Kalamazoo, Mich., has disposed of stock issue of about $300,000, giving controlling interest to Keane, Higbie & Co., Buhl Building, Detroit, investment bankers, and plans are under consideration for expansion.

Hunter Hiderian Air Sea Plane Co., 263 Park Avenue East, Pontiac, Mich., has been formed to manufacture air seaplanes and parts. It is preparing to begin work on its first model and will soon be in market for aircraft motors, sheet aluminum, tubes, rods, angle irons, etc.

New England

BOSTON, Jan. 16.

THE machine tool market in this territory is very quiet. Some improvement is noted in inquiries, but for the most part these are for single items. Inquiries are in hand for heavy-duty equipment, the first received in Boston in several months, and one maker of boring mills reports the sale of two machines to a Western automobile manufacturer. General Electric Co., Pittsfield, Mass., has inquiries out on a number of machines, the business, if placed, to be handled through Schenectady. Other New England plants of the company are expected to buy considerable equipment this year.

Small tools are moving more freely than a week ago, but the market is far from active.

Plans have been completed for a three-story, 57 x 115 ft., addition for Continental Baking Co., Somerville, Mass., for which conveying and other equipment is required. Plans are private.

Equipment of the Vibro Insulator Co., Worcester, Mass., has been sold at public auction. Machinery included a Leland-Gifford four-spindle high-speed drill; two Becker No. 4B and No. 5 vertical millers; Cincinnati universal grinder. Good prices prevailed.

Cambridge Salvage & Supply Co., 91 Broadway, Cambridge, Mass., has plans for a three-story and basement manufacturing and storage plant, 65 x 100 ft. Plans are private.

Fire recently destroyed plant of Coffin Valve Co., Neponsit district, Boston, including foundry and machine shop.

Worcester Wire Works, Inc., 230 Ludlow Street, Worcester, Mass., will build a two-story wire manufacturing plant, 70 x 210 ft., to cost $30,000.

Broadway Iron Foundry Co. and Barbour Stockwell Co., Cambridge, Mass., have consolidated and gray iron equipment of Broadway company has been transferred to Barbour plant, 205 Broadway. Brass foundry and machine shop will be transferred later. R. C. Bird, president Broadway Iron Foundry Co., will be associated with merged company in an official capacity. Property of Broadway company will be sold.

Welker-Hoops Mfg. Co., Middletown, Conn., manufacturer of automobile equipment, cap pistols, etc., has taken over former local plant of Westinghouse Electric & Mfg. Co. for manufacture of new gear shift for automobiles.

Brockton Gas Light Co., Brockton, Mass., plans a one-story addition to its steam power house, to cost in excess of $100,000 with equipment. C. H. Tenney Co., 200 Devonshire Street, Boston, is engineer. Company also plans new automobile service, repair and garage building, 125 x 125 ft., for company use, to cost approximately $75,000. Same engineer will draw plans.

Carpenter Steel Co., Hartford, Conn., has taken out permit for one-story factory branch and distributing plant, to cost about $30,000, for which general contract recently was let to Lawrence & Coe Construction Co., 43 Farmington Avenue. Main mill of company is at Reading, Pa.

Standard Box Co., 28 Gerrish Avenue, Chelsea, Mass., manufacturer of paper boxes and containers, has plans for a two-story addition, 100 x 142 ft., to cost about $80,000 with machinery; Eisenberg & Feer, 46 Cornhill Street, Boston, architects.

New York Power & Light Corporation, Albany, N. Y., has purchased Ridgefield Electric Co., Ridgefield, Conn., and Washington Electric Light & Power Co., Litchfield, Conn., and will consolidate. Plans are under way for expansion, including transmission line construction.

C. V. Badger, 191 Merrimack Street, Haverhill, Mass., architect, has revised plans for a new two-story plant, 60 x 115 ft., for manufacture of acids and kindred chemical specialties, for company whose name is temporarily withheld, to cost $60,000 with machinery.

New England Concrete Pipe Corporation, 79 Milk Street, Boston, has plans for a power house at its works at Newton, Mass., 150 x 160 ft., to cost about $70,000 with equipment; John H. Rogers, 10 State Street, Boston, architect.

E. Ingraham Co., 392 Main Street, Bristol, Conn., manufacturer of clocks, clock movements, etc., will soon take bids for one-story addition, 25 x 160 ft., to be equipped as a press department. Max J. Unkelbach, New Britain, Conn., is architect.

Peerless Unit Ventilation Co., Inc., formerly at Long Island City, N. Y., has moved its main office and factories to 718-734 Crescent Avenue, Bridgeport, Conn. New York office is now at 369 Lexington Avenue.

Boston Gear Works Sales Co., Norfolk Downs, Mass., manufacturer of Standardized power transmission equipment, has let contract for a three-story addition to Clark & Smith, Inc., Quincy, Mass.

Eppley Laboratory, Newport, R. I., has been organized to manufacture precision instruments. Plant has been erected and some new equipment purchased.

South Atlantic States

BALTIMORE, Jan. 16.

BIDS have been asked on general contract by Bethlehem Shipbuilding Corporation, Baltimore, for first unit of its one and two-story addition. Other shops will be built later. Entire project will cost close to $1,000,000 with machinery.

Maryland Paper Mills Co., 5 Hopkins Place, Baltimore, Robert A. Wilson, secretary and treasurer, recently organized, has engaged R. Munson, 609 Southern Building, Washington, engineer, to prepare plans for new units at Glen Burnie, Md., comprising pulp mill to cost about $150,000, and paper-making unit, to cost upward of $250,000 with equipment. Work will soon begin on first unit for paper-bag manufacture, to cost approximately $80,000 with equipment. William W. Ormsbee is president.

J. Glenn Beall, Irving Prichard, Frostburg, Md., and associates, are completing plans for new plant at Mount Savage, Md., for production of large diameter, vitrified sewer pipe, drain tile, etc., reported to cost more than $40,000. Contract for raw material has been made with Union Mining Co., Mount Savage.

Constructing Quartermaster, Fort Benning, Ga., is asking bids until Feb. 3 for construction of 1,000,000-gal. capacity steel standpipe, 50 ft. diameter, and 70 ft. high, with valves, blow-off and mechanical accessories, circular 1.

Carolina Power & Light Co., Raleigh, N. C., has purchased South Carolina Power & Light Co., Kingstree, S. C., and will consolidate with its organization. Expansion is planned in last-noted district, including transmission line construction.

City Commission, Charlotte, N. C., is completing plans for a one-story municipal automobile service, repair and garage building, 115 x 310 ft., to cost about $90,000 with equipment. Robert L. Brown, commissioner of public works, in charge.

Southeast Georgia Power Co., Alma, Ga., recently organized, has acquired local power plant and contemplates extensions and betterments, including installation of additional machinery.

Bureau of Supplies and Accounts, Navy Department, Washington, is asking bids until Jan. 24 for chain hoists for Eastern and Western yards, schedule 8329; also for machine screws, nuts, etc., for Norfolk Navy Yard, schedule 8359; and 10 arc welding sets for Mare Island Yard, schedule 8328.

City Council, Dillon, S. C., plans installation of pumping machinery and accessory equipment for municipal waterworks expansion.

Celluloid Corporation, Amcelle, Cumberland, Md., subsidiary of Celanese Corporation, is completing plans for new plant, 300 x 1000 ft., for production of cellulose acetate, to cost more than $1,500,000 with equipment. Company recently acquired control of Celluloid Co., with plant at Newark, N. J.

Ovens, power equipment, conveying and other machinery will be installed in plant to be erected at Norfolk, Va., by Gardner Bakeries, Inc., 219 Cumberland Street, to cost more than $175,000. Company is operated by General Baking Co., 342 Madison Avenue, New York.

Georgia Power Co., Atlanta, Ga., is completing an expansion program to cost more than $12,755,000, including power plants, transmission lines, substation equipment and other work. New power substation will be built at Atlanta, and similar plant at Marietta, enlarged. New gas-generating equipment and vertical retorts will be installed at Atlanta gas works.

Citizens' Crystal Ice Co., Inc., Roanoke, Va., is considering equipment for pulverizing and burning powdered fuel, and is desirous of getting in touch with manufacturers.

J. L. Gray, Gastonia, N. C., is planning purchase of automatic machines for finishing cast gears of steel, brass and other metal.

Ohio Brass Co., Mansfield, Ohio, has opened an office at 721 Healy Building, Atlanta, Ga., as headquarters for its sales representatives in that section.

Hampton Roads Steel Co., 1086 West Thirty-fifth Street, Norfolk, Va., has been organized to operate warehouse and fabricate structural steel and reinforcing bars and deal in metal lath, steel joists and other steel products.

Rome Electric Range Co., Rome, Ga., has been organized to manufacture electric ranges. Company has plant on North Second Avenue, and will begin manufacture immediately.

St. Louis

ST. LOUIS, Jan. 16.

OFFICIALS of B. F. Mahoney Aircraft Co., San Diego, Cal., are organizing a company under Missouri laws, with capital of $500,000, to construct and operate a new plant for production of Ryan airplanes at Bridgeton, near St. Louis, one and two-stories, to cost about $60,000 with equipment. It is proposed to remove San Diego business to new location.

Board of Education, Ada, Okla., is considering installation of manual training equipment in two-story high school, to cost $200,000, for which bids will soon be received on general contract. Albert S. Ross, 116 Main Street, is architect.

Atchison, Topeka & Santa Fe Railway Co., Topeka, Kan., has plans for one-story machine shop at its works at Guthrie, Okla., to cost upward of $40,000 with equipment. H. W. Wagner, Topeka, is chief engineer.

Standard Brass Mfg. Co., Thirteenth and Chestnut Streets, Kansas City, Mo., will proceed with erection of a one-story foundry and machine shop, 100 x 130 ft., to cost more than $50,000 with equipment.

Board of Education, Kearney, Neb., has plans for one-story addition to its manual training school to cost about $35,000. H. M. McClure, Kearney, is architect.

Willard Storage Battery Co., M. E. Smith Building, Omaha, Neb., has awarded general contract to A. C. Busk Construction Co., 520 North Fifty-first Street, for one-story factory branch and service works to cost $30,000. Headquarters at St. Clair Avenue and East 131st Street, Cleveland.

Oklahoma Gas & Electric Co., Oklahoma City, Okla., is arranging an expansion and improvement program, including installation of third generating unit at Horseshoe Lake power plant, to develop capacity of 87,500 hp., extensions in transmission lines, and installation of equipment in Broadway substation to double present output.

Union Wire Rope Co., Kansas City, Mo., has disposed of its rolling mill to Consolidated Rolling Mill Co., Mexico City, Mexico, which will remove equipment to last noted city.

Arkansas Power & Light Co., Little Rock, Ark., plans extensions and improvements in Pine Bluff, Ark., district, including transmission line construction and enlargements in Woodward and Dixie power substations, to cost $400,000.

Clark-McWilliams Co., Clarksville, Ark., is said to be planning to rebuild tipple at its Igo mine recently destroyed by fire, with loss at $40,000 including equipment.

J. A. Werme Iron Works, 1426 West Main Street, Oklahoma City, Okla., has plans for one-story addition, 90 x 300 ft.

Choctaw Culvert & Machinery Co., Memphis, Tenn., is considering erection of new plant at Pine Bluff, Ark., for manufacture of metal culverts and affiliated products, to cost close to $35,000 with equipment.

Kansas Power & Light Co., Atchison, Kan., will make extensions and improvements in ice-manufacturing plant, with installation of additional machinery to cost $70,000.

Universal Traffic Control Co., Oklahoma City, Okla., has removed its factory and general offices to St. Louis, latter to be maintained in Title Guaranty Building. It makes automatic signals for directing street traffic.

Bell-Davis Machinery Manufacturers, Inc., Pleasant Hill, Mo., has been formed to make shingle mill attachments for standard make saw rigs; Bell-Davis saw rigs; and its collapsible anchors. Company is assembling products at present, but expects to erect factory in spring. It is in market for steel wheels for trucks carrying portable rigs and also gears and steel frame materials.

Cleveland

CLEVELAND, Jan. 16.

MACHINE tool sales and inquiries continue fairly good, although business is confined largely to single machines. The market has been stimulated by present activity of manufacturers of automobile parts. Most of the plants in this field are now operating at capacity. Some business in small lots has come from automobile companies in Detroit territory, which bought very little machinery the last months of 1927. An order for several drilling machines was placed the past week by a Cleveland screw manufacturer. A local builder of turret lathes reports a heavy volume of single machine orders, mostly from New York and Chicago territories. This business has resulted from quotations made before the recent price advance. No inquiry is coming from railroads in this territory.

Valve Bag Co., Toledo, Ohio, manufacturer of paper valve bags, bag-filling machines, etc., has arranged for preferred stock issue of $1,500,000, a portion of fund to be used for expansion. Company operates plants at Toledo, Oakmont, Pa., and Windsor, Ont. Carl G. Hartman is vice-president and general manager.

East Ohio Gas Co., 1405 East Sixth Street, Cleveland, has plans for a one-story and basement repair works at Dennison, Ohio, to cost about $27,000 with machinery. C. J. Marr, 139 North Broadway, New Philadelphia, Ohio, is architect.

Northern Ohio Produce Co., 806 Broadway, Cleveland, C. Haas, president, plans installation of a cold storage and refrigerating plant in its produce terminal, to cost upward of $2,500,000 with equipment. Wilbur Watson & Associates, 4614 Prospect Street, are architects and engineers.

Ohio Public Service Co., Elyria, Ohio, will take bids in spring for a one-story equipment storage and distributing plant, with repair facilities, to cost close to $80,000 with equipment. R. S. Silsbee, Elyria Savings & Trust Building, is architect.

Department of Public Service, Elyria, Ohio, James A. Hewitt, director, plans installation of an electric power plant, two stories, 32 x 42 ft., with electrically-operated pumping units in connection with a sewerage disposal works. Entire project will cost more than $750,000. George B. Gascoigne, Leader Building, Cleveland, is engineer.

Board of Education, Cadiz, Ohio, plans installation of manual training equipment in high school, for which bids have been asked on general contract, to cost $250,000. C. W. Bates, 77 Twelfth Street, Wheeling, W. Va., is architect.

Pittsburgh

PITTSBURGH, Jan. 16.

INQUIRY for machine tools the first two weeks of the new year have been more numerous than sales, only a few small orders having been placed since the first of the month. So many inquiries and requests for prices for estimating purposes are out that it is believed considerable business will develop before spring. There are 11 or 12 items in the Westinghouse Electric & Mfg. Co.'s quarterly list which remain to be placed. In heavier lines is the wide strip mill to be installed by Wheeling Steel Corporation, and announcement is expected shortly of the closing of three seamless pipe mill units in Pittsburgh district mills.

General contract has been let by Fort Pitt Steel Casting Co., McKeesport, Pa., to Austin Co., for a one-story foundry addition, 60 x 200 ft.

Westinghouse Electric & Mfg. Co., East Pittsburgh, Pa., has purchased 80 acres in Wilkins Township, and is reported planning expansion in that section.

Ready Mixed Concrete Co., South Twenty-second Street, Pittsburgh, has awarded general contract to Hughes-Foulkrod Co., Stevenson Foster Building, for new four-story plant, to cost close to $50,000 with equipment.

Board of Education, Glassport, Pa., plans installation of manual training equipment in two-story high school, for which bids are being taken on general contract, to cost $200,000. H. C. Clepper, Century Building, Pittsburgh, is architect.

Union Carbide & Carbon Corporation, 30 East Forty-second Street, New York, operating Carbide & Carbon Chemicals Corporation, South Charleston, W. Va., is said to be planning expansion program at last-noted plant, to cost more than $5,000,000, including construction of new works on Blaine's Island, where property was secured several months ago.

Pittsburgh Knife & Forge Co., Coraopolis, Pa., has changed its name to Pittsburgh Forgings Co.

Columbia Steel & Tube Corporation, 233 Broadway, New York, is completing new pipe works in Stanton Park district, Steubenville, Ohio. Building will have 22,000 sq. ft. of floor space and will be used for cutting and other mechanical operations, storage and distributing service. Equipment has been purchased and pipe and tubing will be secured under contract from Wheeling Steel Corporation, Wheeling, W. Va.

Chicago

CHICAGO, Jan. 16.

SALES of machine tools are more numerous with agricultural machinery manufacturers the principal buyers. A tractor manufacturer in central Illinois has placed $200,000 worth of orders and some requirements are still to be met. The International Harvester Co., principally at its McCormick plant in Chicago, has enlarged its replacement program. Another large industrial list has been prepared by a road machinery manufacturer at Milwaukee. Stephens-Adamson Mfg. Co., Aurora, Ill., has purchased a number of machine tools. Orders and inquiry from railroads are dull. The St. Paul is asking for prices on a micro-grinder and a heavy-duty veneer press.

Over 400 surplus machine tools are being offered for sale by the Kelly-Springfield Truck & Bus Co., Springfield, Ohio, adding a further burden to a market already well supplied with used tools.

Price advances of 10 per cent are announced on two lines of screw machines and turret lathes.

Plant of Central Foundry Co., Marshalltown, Iowa, was destroyed by fire Jan. 2 with estimated loss of $200,000.

Business of William L. Procunier, 18 South Clinton Street, Chicago, manufacturer of safety tapping chucks and attachments, has been incorporated under title of Procunier Safety Chuck Co., and will continue manufacture of tapping devices, quick change chucks and stud setting tools.

Michael Tauber & Co., 317 South Market Street, Chicago, has removed to 411-423 South Market Street.

Murray Iron Works Co., engineer, founder and boilermaker, Burlington, Iowa, has purchased turbine business of Standard Turbine Corporation, Scio, N. Y., and has removed equipment to Burlington, where turbines will be manufactured in future.

Bids will soon be asked by Reiter Co., Elgin, Ill., manufacturer of water softening and purifying equipment, for a two-story addition, to cost about $50,000 with machinery.

Manufacturers' Brass Foundry Co., Chicago, recently organized, has leased a one-story building, 55 x 100 ft., at 2721-23 Poplar Avenue, for establishment of a plant.

Galesburg Coulter-Disc Co., Galesburg, Ill., manufacturer of shovels, sheet steel products, disk blades for agricultural equipment, etc., has arranged for sale of common stock issue to total $2,375,000, portion of fund to be used for expansion.

Goldberg & Cohen, Inc., 2139 Ogden Avenue, Chicago, manufacturer of automobile bodies, has plans for a one-story addition, 75 x 100 ft., to cost close to $40,000 with equipment.

J. I. Case Threshing Machine Co., 102 Eighth Street, Des Moines, Iowa, has plans for a three-story addition, to cost $40,000. C. V. Johnson, Commonwealth Building, is architect. Headquarters are at Racine, Wis.

Fisher Governor Co., South First Avenue, Marshalltown, Iowa, manufacturer of engine governors, will soon begin erection of a one-story addition, to cost close to $45,000 with equipment; Harry Reimer, Kibbey Building, architect.

Richardson Rod & Reel Co., 536 Lake Shore Drive, Chicago, manufacturer of steel fishing rods, tackle, etc., is completing plans for a two-story factory, 62 x 120 ft., to cost close to $50,000 with equipment. Van Gunten & Van Gunten, 26 East Huron Street, are architects.

Great Northern Utilities Co., Shelby, Mont., has plans for one-story ice-manufacturing and cold storage plant, to cost about $45,000 with equipment.

Century Brass Works, Inc., 518 Fifth Avenue South, Minneapolis, Minn., has work under way on a one-story addition, to cost $50,000 with equipment. General contract recently was let to Splady & Haagenson, 609 Marquette Avenue.

Grigsby-Grunow-Hinds Co., 4534 Armitage Avenue, Chicago, manufacturer of radio equipment, has leased plant of Yellow Truck & Coach Mfg. Co., totaling 260,000 sq. ft. floor space, for establishment of a new plant. Yellow Truck company is completing erection of new works at Pontiac, Mich., and will remove to that point early in March, when leasing company will take possession.

Indiana

INDIANAPOLIS, Jan. 16.

PLANS are under consideration by Union Fiber Co., Winona, Minn., for new fiberboard mill at Wabash, Ind., one story, 50 x 100 ft., to cost about $45,000 with equipment.

G. I. Sellers & Sons Co., Elwood, Ind., manufacturer of kitchen cabinets, etc., has arranged for a preferred stock issue of $500,000, portion of fund to be used for expansion.

Van Camp Packing Co., 2002 South East Street, Indianapolis, is said to have acquired control of Richland Cotton Oil Co., Richland, Ga., and will continue operations as subsidiary. Plans are under advisement for expansion, including facilities for larger output at Richland.

Cartmen, Burcaw & Moore, Inc., 540 North Meridian Street, Indianapolis, contractor, has filed plans for three-story and basement automobile service, repair and garage building, 90 x 140 ft., to cost $150,000.

Hygrade Lamp Co., Salem, Mass., manufacturer of incandescent lamps, has purchased Triumph Lamp Works, Indianapolis, and will take immediate possession. It is purposed to discontinue production at acquired plant and machinery will be dismantled and removed to Salem, where operations will be concentrated and plant expanded.

Noblitt-Sparks Industries, Inc., Indianapolis, has been formed to take over and succeed to Indianapolis Pump & Tube Co., 603 East Washington Street, with branch plants at Greenwood, Columbus and Seymour, Ind., manufacturer of pumps, tubing, automobile heaters, coaster wagons, etc. Operations will be extended. Noblitt is president; and Frank H. Sparks, secretary-treasurer.

L. Harry Warriner, 673 Broadway, Gary, Ind., architect, has plans for a three-story automobile service, repair and garage building, to cost close to $100,000 with equipment.

City Council, Anderson, Ind., is reported having plans for extensions and improvements in municipal light and power house, including establishment of auxiliary station for service in South Anderson, to cost more than $200,000 with equipment.

Interstate Public Service Co., Goshen, Ind., has concluded arrangements for purchase of Midway Electric Co., Shipshewanna, Ind., and will consolidate with its organization. Plans are under way for expansion in latter district, with installation of additional equipment and transmission line construction.

Oakes-Swenson Co., 1479 East Nineteenth Street, Indianapolis, has been formed to manufacture metal stampings, including drawn work, and engage in heat treating. It will also design and make dies. Factory and equipment have been purchased.

Harrison Steel Castings Co., Attica, Ind., has been formed to take over assets and business of National Car Coupler Co., Attica, and will continue manufacture of miscellaneous steel castings, Hinson emergency knuckles and National couplers. J. W. Harrison is president.

Delaware Brass & Aluminum Co., Muncie, Ind., has changed its name to Beckett Bronze Co. It manufactures screw machine products.

Gulf States

BIRMINGHAM, Jan. 16.

PLANS are under way by Missouri-Kansas-Texas Railroad Co., Dallas, Tex., for extensions and improvements in its shops at Waco, Tex., to cost $50,000 with equipment; Albert T. Clifton, Waco, managing director, in charge.

Texas Central Power Co., Frost Building, San Antonio, Tex., is said to be contemplating a new cold storage and refrigerating plant at Raymond, Tex., to cost approximately $90,000 with machinery.

Clarence W. King, Shreveport, La., architect, has plans for a three-story automobile service, repair and garage building, 115 x 150 ft., to cost about $100,000 with equipment. It will be occupied under lease by S. & L. Service & Storage Co., 200 Edwards Street, Edward R. Lowe, manager.

Gulf States Utilities Co., Beaumont, Tex., has arranged for preferred stock issue of 30,000 shares, a portion of proceeds to be used for extensions and improvements. Company has work under way on an addition to its Neches power plant to increase capacity by 47,000 hp.; extensions will be made in transmission lines for connection with system of Houston Lighting & Power Co., Houston, Tex.

Wichita Falls Foundry & Machine Co., Barwise Street, Wichita Falls, Tex., is completing plans for one-story addition to its machine shop, 30 x 80 ft., and will install new equipment.

South San Antonio Ice Mfg. Co., San Antonio, Tex., is planning erection of one-story plant to cost $60,000.

R. B. George Machinery Co., Dallas, Tex., will erect a new one-story plant to cost close to $40,000 with equipment. J. A. Pitzinger, Dallas, is architect and engineer.

West Texas Utilities Co., Dallas, operated by Central & South West Utilities Co., Allen Building, is completing plans for one-story steam-operated electric generating station at Lake Pauline, near Quanah, Tex., with initial capacity of 15,000 kw. and ultimate output of 45,000 kw. Four transmission lines will be built and a power substation and switching plant. Entire project will cost more than $3,000,000.

United Public Service Co., 100 West Monroe Street, Chicago, has purchased Southern Ice & Fuel Co., South Royal Street; City Ice Co., and ice plant of Weinacker Ice & Fuel Co., all at Mobile, Ala. Plans are under advisement for extensions and improvements and installation of additional equipment. George E. Wells, St. Louis, is consulting engineer.

Board of Levee Commissioners, Yazoo-Mississippi Delta, Clarksdale, Miss., J. W. Cutrer, president, is asking bids until Feb. 1 for a drainage pumping plant, including both oil engine-driven and electrically operated equipment, oil engines of full Diesel type, vertical construction; synchronous electric motors; pumping units to have capacity of 50,000 gal. per min. Work to include motor-generator set, vacuum pump, electric switchboard, oil tanks, and auxiliary equipment. W. L. Head is chief engineer.

Houston Lighting & Power Co., Houston, Tex., is planning an expansion and improvement program to cost more than $5,000,000, including enlargements in Deepwater generating plant and installation of equipment to cost about $2,500,000; new power substations and extensions in present stations, $500,000; transmission lines, $200,000; distributing lines, $355,000; stores, shops and other mechanical buildings, $410,000; substation feeders, $400,000, and miscellaneous work.

Dock Commissioners, New Court House, New Orleans, have filed plans for a one-story equipment storage and distributing plant, with shop and repair facilities, to cost more than $100,000 with machinery.

Town Council, Lake Placid, Fla., is asking bids until Jan. 25 for equipment for a municipal waterworks, including pumping apparatus, and elevated steel tank and tower with capacity of 100,000 gal., including valves, fittings, etc. Bishop Engineering Co., Orlando, Fla., is engineer.

Sinclair Pipe Line Co., Sinclair Building, Tulsa, Okla., is said to be planning installation of pipe line, with booster stations, etc., from Mexia, Tex., oilfields to Healdton, Tex., with increase in present main trunk line in Mexia district, to cost more than $1,500,000.

Milwaukee

MILWAUKEE, Jan. 16.

MODERATE activity is reported in the machine-tool market, with improvement generally noted. Prospects are more promising, and there is a substantial increase in inquiry. The automotive industries as yet are providing only a small volume, but many companies are asking for prices and delivery specifications on prospective needs, and some of this business is expected to be placed before the close of the month. Demand is better than in the October-December period and averaging at least as well as in January, 1927.

Maynard Electric Steel Casting Co., Milwaukee, has increased its capitalization from $210,000 to $500,000 in contemplation of enlargement of its plant at Kilbourn Road and Chicago & Northwestern tracks. Details have not been definitely determined, but it is stated that present capacity of 1000 tons a month will be approximately doubled.

City of DePere, Wis., closes bids Jan. 27 on one 4-in. single stage centrifugal pump of 500 gal. per min. capacity, direct connected to one S5 4-cylinder Continental commercial engine with power take-off, clutch and pulley for belt driving compressor. M. A. Maes is city clerk.

Manitowoc Portland Cement Co., Manitowoc, Wis., has engaged Manitowoc Shipbuilding Corporation to design and erect an extension to its main building, to cost about $500,000 with equipment; work to begin at once.

Great Northern Railway Co., St. Paul, Minn., is taking bids for construction of 240 additional concrete tanks, 110 ft.

high and 13 ft. diameter, at its grain elevator in Superior, Wis. Workhouse also will be enlarged and additional machinery installed to handle enlarged storage capacity. Project calls for an investment of upward of $800,000.

Common Council, Stoughton, Wis., has authorized board of public works to obtain estimates on modern machinery and equipment for municipal light and power plant. A complete replacement is contemplated at a probable cost of $40,000 or more. Edgar Norman is city clerk.

F. C. Steiner, County highway commission, Oshkosh, Wis., closes bids Jan. 24 for furnishing a portable stone crushing plant with a capacity of 300 yd. in 10 hr., and bin, screen, track and cars, conveyors, etc.

Max P. Janisch, vice-president and general manager Special Stamping & Mfg. Co., 1919 St. Paul Avenue, Milwaukee, is principal incorporator of Steelstamp Corporation, Milwaukee, which has organized to manufacture stampings, dies, etc. John Schwan and B. B. Janisch are other principals. Plans have not yet been made known.

McCusker-Foulkes Co., 235 Cambridge Avenue, Milwaukee, has contracted for erection of a repair and service shop addition, 50 x 125 ft., to its automotive sales and service building. Architect is Verner H. Esser, 82 East Wisconsin Avenue, local.

Board of Regents, University of Wisconsin, Madison, has released a fund of $10,000 for preparation of plans for new mechanical engineering building. Arthur Peabody is State architect. M. E. McCaffrey is secretary of board.

Common Council, Rhinelander, Wis., has engaged Burns & McDonald, consulting engineers, Kansas City, Mo., to design and supervise construction and equipment of a municipal filtration plant costing about $90,000. A referendum on a bond issue in this sum will be held in April.

Cincinnati

Cincinnati, Jan. 16.

MACHINE tool orders dropped off the past week with result that business the first half of January was less than that in the early part of December. Inquiries, however, are numerous and it is believed that sales in the first quarter of 1928 will attain fairly liberal proportions. Increased buying of equipment by companies in Detroit district is noted and prospective bookings from that source are the largest in several months. A wheel manufacturing company is reported to have bought 10 18-in. lathes from a Sidney, Ohio, builder. With few exceptions, local manufacturers state that customers have taken only one or two machines each. A few scattered orders have been received from European countries, but in the aggregate they are not of large volume.

Crosley Radio Corporation, Colerain Avenue and Sassafras Street, Cincinnati, has begun manufacture of a portable, hand-operated refrigerating unit to be known as Icyball. New branch of business will not interrupt or interfere with manufacture of radio receiving sets, company's main product.

Following recent acquisition of John J. Bruce Foundry Co., Colerain Avenue, Cincinnati, by Shepard Elevator Co., with plant on adjoining site devoted to ball bearing elevator manufacture, purchasing company has arranged for continuance of operations at foundry and will carry out an expansion program. Considerable portion of production will be given over to elevator castings for Shepard company.

Tietig & Lee, Merchants' Building, West Sixth Street, Cincinnati, architects, have plans for a new eight-story and basement automobile service, repair and garage building, to cost close to $500,000 with equipment.

Steel Products Engineering Co., Springfield, Ohio, has plans for a one-story addition, to cost in excess of $35,000 with equipment.

Volunteer Portland Cement Co., Knoxville, Tenn., is disposing of a bond issue of $600,000, a portion of proceeds to be used for expansion.

Tennessee Electric Power Co., Chattanooga, Tenn., is arranging an expansion and improvement program, including power plants and transmission lines, to cost approximately $5,000,000.

Mead Pulp & Paper Co., Chillicothe, Ohio, is reported planning an early call for bids for a new mill at Sylva, N. C., to cost more than $750,000 with equipment.

Everwear Mfg. Co., Springfield, Ohio, manufacturer of swings and playground equipment, is said to have plans for a one-story addition, 50 x 50 ft., to cost close to $30,000 with equipment.

Kentucky Chemical Co., 410 East Tenth Street, Covingington, Ky., is said to be planning a new one-story plant at Brighton, near Cincinnati, to cost more than $50,000 with equipment.

Board of Trustees, Betelle Memorial Institute, 186 East Broad Street, Columbus, Ohio, plans installation of a machine shop and other manual training departments in a new three-story building, to cost more than $200,000. O. C. Darst, 150 East Broad Street, is architect.

Ohio Brass & Copper Co., 222 Post Square, Cincinnati, has been acquired by Chase Brass & Copper Co., Waterbury, Conn., distributer of brass and copper products of Chase Companies, Inc., Waterbury. Business will be continued in same location in Cincinnati under management of Henry E. Heitz, president of Ohio company, and will be known as Cincinnati branch of Chase Brass & Copper Co. Complete stock of Chase products will be carried.

Pacific Coast

San Francisco, Jan. 11.

AN expansion and betterment program is being arranged by Certainteed Products Co., Richmond, Cal., manufacturer of roofing, etc., to cost close to $100,000, including new buildings and equipment. Ralph Bergen is plant manager. Headquarters are at 100 East Forty-second Street, New York.

A-G Mfg. Co., Los Angeles, manufacturer of electrical equipment and appliances, has awarded general contract to William P. Neil Co., Inc., 4814 Loma Vista Street, for a new one-story plant, 90 x 135 ft., to cost about $40,000 with equipment. Headquarters are at 303 West Hudson Street, Seattle.

Municipal Power and Light Bureau, South Broadway, Los Angeles, will proceed with construction of steam-operated electric power plant at San Pedro Harbor, for stand-by service, to cost upward of $500,000 with equipment. E. F. Scattergood is chief engineer.

Mesick & Mahy Mfg. Co., 1431 South Wall Street, Los Angeles, manufacturer of plated ware, has filed plans for a three-story addition, to cost about $45,000 with equipment.

Grant Oil Tool Co., Los Angeles, manufacturer of oil-drilling equipment, is completing plans for a one-story factory, 48 x 170 ft., to cost about $35,000 with equipment. H. M. Banfield, Bryson Building, is architect.

Arizona Edison Co., Globe, Ariz., is disposing of bond issue of $1,700,000, portion of proceeds to be used for extensions and improvements, including transmission line construction, and acquisition of other properties.

Priest Rapids Ice & Cold Storage Co., White Bluffs, Wash., is considering erection of an addition to cold storage and refrigerating plant, to cost close to $30,000. Work will begin in spring.

Allis-Chalmers Mfg. Co., Milwaukee, has secured property at First Avenue South and Atlantic Street, Seattle, as site for a three-story factory branch and distributing plant, 60 x 150 ft., to cost approximately $100,000 with equipment. Work will begin in spring. Local offices at 115 Jackson Street, Rex T. Stafford, Seattle manager.

San Diego Consolidated Gas & Electric Co., San Diego, Cal., has secured permission to issue common stock in amount of $2,000,000, portion of fund to be used for extensions and improvements.

Texas-Louisiana Power Co., Fort Worth, Tex., is reported planning a new steam-operated electric power house and ice-manufacturing plant in vicinity of Duncan, Ariz., to cost more than $100,000.

Peck & Hills Furniture Co., 800 North Spring Street, Los Angeles, is considering erection of new seven-story factory branch and distributing plant, 120 x 240 ft., near Denny Way, Seattle, to cost approximately $500,000 with machinery.

Engineering, Research & Equipment Co., 655 Roosevelt Building, Los Angeles, has been organized to do general engineering research business and manufacture equipment for oil refining and gasoline extraction. Equipment contracts have been made.

Austin-Western Road Machinery Co., Chicago, has opened branch office at 354 Belmont Street, Portland, Ore., in charge of F. B. McBath. It also expects to establish sub-branches at Seattle and Spokane, Wash.

Canada

Toronto, Jan. 16.

MACHINE tool sales on replacement account are increasing, but for the most part are in units of one or two. Inquiries are somewhat better. The railroads have recently purchased some tools, and more extensive buying is looked for within a few weeks.

Copies of tender forms and specifications from D. H. Ross, trade commissioner, Melbourne, Australia, for machinery required by Supply and Tender Board of South Australia, Adelaide, for railroad shops of the State, are available at Department of Trade and Commerce, Ottawa, Canada. List includes one 10-in. combination turret lathe with electrical equipment; one vertical turret lathe and thread-cutting attachments with electrical equipment; one precision facing, boring and milling machine; one draw-stroke shaping machine with electrical equipment; one double-head centering machine with electrical equipment. Tenders close March 21. Last available mail leaves San Francisco Feb. 21, and is due at Adelaide March 19.

Ratepayers of Wheatley, Ont., have authorized expenditure of $84,000 for construction of waterworks plant and system. A. W. Connor & Co., Metropolitan Building, Toronto, are engineers.

P. McConnell, Pitt Street West, Windsor, Ont., will build a machine shop, 60 x 80 ft., at a cost of $10,000.

E. G. M. Cape & Co., 10 Cathcart Street, Montreal, have been awarded general contract for construction of a one-story building, 135 x 150 ft., for Northern Electric Co., 121 Shearer Street, to cost $70,000.

C. H. Taylor, 193 King Street East, Toronto, will build two machine shop additions, one one-story, 30 x 34 ft., and the other two stories, 12 x 30 ft. A. Switzer, 62 Melbourne Avenue, Toronto, has general contract. Equipment will be purchased.

Preston Electric Porcelain Co., Centre Street, Preston, Ont., will start work immediately on erection of a one-story factory, 121 x 360 ft., to cost $100,000. H. G. Duerr, 1010 Lumsden Building, Toronto, is architect.

Bids will be received until Jan. 25 by executive committee, City Hall, Montreal, J. Etienne Gauthier, city clerk, for one 30 m. g. d. electric pump. Specifications at office of Montreal Water Board, 259 Joseph Street, Verdun, Que.

Nova Scotia Tramways & Power Co., Halifax, N. S., is completing arrangements for erection of an addition to its coking plant.

Plant of Hastings Paper Mills Ltd., Thurlow Township, Ont., was recently destroyed by fire with loss of $100,000.

Western Canada

Plant of Alberta Wood Preserving Co., Calgary, Alta., was recently destroyed by fire with loss of $200,000.

Bartholomew, Montgomery & Co., Standard Bank Building, Vancouver, B. C., have been awarded general contract for construction of a hydroelectric power plant at Cambore Creek, near Revelstoke, B. C., for Teddy Glacier Mines, Ltd. Building will be one and one-half stories, 40 x 65 ft. and cost about $50,000. Contract includes erection of power house and dam. F. J. Bartholomew, 510 Hastings Street, Vancouver, is architect.

Foreign

BIDS are being asked by Victorian Government Railways, Melbourne, Australia, until Feb. 22, for one electric butt welding machine, complete with all accessories.

Colonial Government, Nassau, Bahama Islands, has authorized fund of about $160,000 for extensions and improvements in local electric light and power plant, including new machinery. Information at office of Bureau of Foreign and Domestic Commerce, Washington, reference Bahamas No. 264689; also, at American Consulate, Nassau, M. E. Gyr, consul.

Amtorg Trading Corporation, 165 Broadway, New York, official buying agency for Soviet Russian Government, will place orders soon for railroad construction machinery and equipment for Turkestan-Siberian Railway line, amounting to about $1,000,000. A railroad delegation has arrived in United States to select equipment, headed by A. A. Lazarevsky, chief engineer, new lines department, Soviet Commissariat for Transportation; L. M. Perlman, assistant chief engineer; and S. M. Ivanov, vice-president, Turkestan-Siberian Railway.

Mexican Light & Power Co., Mexico City, Mexico, is arranging an expansion program to cost about $7,000,000, including rebuilding several generating stations, transmission and distributing lines, and installation of new machinery. Present gross capacity of 195,000 hp. will be considerably increased.

Two steel companies in Czechoslovakia are arranging for joint construction of a new rolling mill at Karlshutte, primarily for production of fine sheet steel, and will begin work soon. Information at office of Bureau of Foreign and Domestic Commerce, Washington, reference Czechoslovakia No. 60119; also, at American Consulate, Prague, Czechoslovakia, K. L. Rankin, assistant trade commissioner.

Bids will be received by New Zealand Government Railways, Wellington, until April 21, for machine tools, including one 13-in. combination lathe, two capstan lathes, six vertical medium drilling machines, four vertical drilling machines, one plate edge planing machine, two die-sinking machines, three crank shaping machines, two locomotive wheel balancing machines, one slotting machine, two nut-tapping machines, one hydraulic riveter, four electric welding sets, 30 belt-driven spring power hammers, 11 pneumatic power hammers, two sand slinger molding machines, and two electric lifting magnets.

NEW TRADE PUBLICATIONS

Industrial Signal Systems.—Hansen Mfg. Co., Princeton, Ind. Catalog 8, describing in detail the various types of signal systems and timing devices for use in maintaining punctuality and discipline economy in industrial plants and school buildings.

Fire Fighting Equipment.—Pyrene Mfg. Co., 560 Belmont Avenue, Newark, N. J. Bulletin announcing the Phomene accumulator, an automatic foam fire protector for use in all types of industrial plants. The accumulator is charged with dry powder and a water line connection is made at the bottom which mixes automatically.

Valves.—Homestead Valve Mfg. Co., Homestead, Pa. Catalog 34, describing the company's line of valves for use in power plants and process or general industries. Listed for the first time are the Homestead protected seat hydraulic operating valve with remote control attachment, the larger size quarter-turn plug valve equipped with gear operating device and the Ross air valve.

Washing Machinery.—Nielsen Industries, Inc., Maccabee Building, Detroit. Brief bulletin describing the company's Lightning washer for cleansing buildings, automobiles and various other articles on which spray work is possible.

Power Transmission Machinery.—Winfield H. Smith, Inc., Springfield, N. Y. Circular describing the company's line of light power transmission machinery. Illustrations of speed reducing gears, hangers, pillow blocks and other equipment for use in installations of small horsepower capacity are included.

Air Filters.—Reed Air Filter Co., Inc., Louisville, Ky. File sheet 30D3, providing data and specifications on the automatic self-cleaning Reed Streamline air filter. Unusually practical is the information on determining the size of filter required.

Industrial Heating Appliances.—American Gas Furnace Co., Spring and Lafayette Streets, Elizabeth, N. J. Bulletin illustrating some of the company's late designs of furnaces, heating and carbonizing machines, etc. Brief descriptions of the machines are included.

Gas Handling Equipment.—Connersville Blower Co., Connersville, Ind. Bulletin 33, devoted to a gas booster designed for use in plants where pressure is low or where gas is distributed to various departments through considerable lengths of piping. A special feature is the arrangement for equalizing pressure in oil reservoirs and thus preventing lubricating oil from working into the gas line.

VOL. 121, No. 4

Steels for Locomotive Forgings

Must Be Sound and Clean under Fracture and Deep-Etch Test, Heated with Deliberation, and Finally Normalized and Annealed for Highest Qualities

BY E. J. EDWARDS*

DESIGNING engineers will, I believe, agree that there are few machines built today where the service required of the forgings is more severe than in the modern locomotive, which in freight service may haul a train of 100 to 125 loaded freight cars at 35 to 50 miles per hour. The new Hudson-type passenger locomotive shown in the head piece, furnished by the American Locomotive Co. to the New York Central Railroad in November, 1927, will pull 25 Pullman cars at a rate of 65 miles per hour. Its wheel base is 83 ft. 7½ in., the engine alone weighs 349,500 lb., and it has a maximum tractive effort with booster of 53,200 lb. No more than two or three years ago, the average run was approximately 100 to 150 miles. Today, the modern passenger locomotive is called upon for 400 to 800 miles in one trip.

The American Locomotive Co. has built a new forge and heat-treating plant at Dunkirk, described in detail in THE IRON AGE, Jan. 12, 1928, p. 127, where special care is taken to secure a product that will meet the exacting requirements of the various railroad specifications. While the larger tonnage produced is locomotive material, the shops are in a position to make forgings for other machinery manufacturers in various designs up to 16 in. in diameter or thickness.

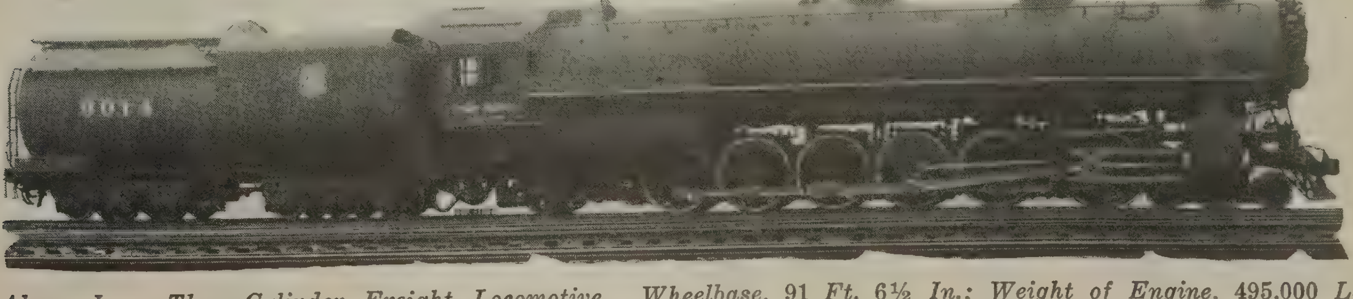
Change from Wrought Iron Brought Many Problems

It should be stated that up to 25 years ago nearly all locomotive forgings were made of wrought iron. Scrap, carefully selected from old rolling stock, with new bars as required, was piled into faggots, heated to welding temperature and forged into billets under a steam hammer. Enough of these billets were then wired together, reheated and rewelded into a piece big enough for the forging required. The piece was then delivered to the machine shop without heat treatment.

Since that time the demand for stronger and better parts has grown continuously. In 1908 one of the leading railroads specified steel of the following analysis (ladle test):

Carbon	0.35 to 0.50 per cent
Manganese	0.40 to 0.60 per cent
Phosphorus	less than 0.05 per cent
Sulphur	less than 0.05 per cent

At that time little attention was given to check



Above Is a Three-Cylinder Freight Locomotive. Wheelbase, 91 Ft. 6½ In.; Weight of Engine, 495,000 Lb.; Maximum Tractive Effort, 96,650 Lb.

---

*Engineer of tests American Locomotive Co., Schenectady, N. Y.

analyses, the amount of segregation was not determined, nor was it certain that a sufficient top and bottom discard was being made to insure only sound dense metal, free from segregation. Little or no attention was given to the rate of heating the billets, the time of soaking at heat, or the final temperature of forging. An occasional tensile test was made for record purposes but was not used as a basis of acceptance or rejection. A forging made under such conditions was placed in service without ever having seen an annealing furnace. Suffice it to say that a medium carbon steel in such a state was not fit for the purpose intended.

Elongation	28
Reduction	61

In 1907 or 1908 it also began to be recognized by railroad men that annealing was necessary in order to refine the crystalline structure of the metal. To do this, driving axles were placed into a flange furnace, wherein the flame came in direct contact with the metal. After heating to a cherry red, the axle was allowed to cool in the furnace or in the air. Crude though this practice was, an improvement was seen in the quality of the driving axles and it was not long before the other important forgings, such as rods, crank pins and piston rods, were annealed.

At about the same time forgings in nickel and vanadium alloy steels were made. Such forgings were annealed only. Some of these are, I believe, still in service, but the analysis of the nickel steels apparently was not properly balanced, with the result that such forgings did not find favor.

Late in 1909 or early in 1910 a large number of quenched and tempered chrome-vanadium forgings were made for engines then being built. Results were most disappointing, as a large percentage failed in service. The failures were due to thermal ruptures which were no doubt present in the forging previous to the heat treating, defects which were intensified by the internal strains set up in the quenching.

Soon thereafter a considerable tonnage of quenched and tempered carbon steels was specified, but again the service results were disappointing. A large number of failures were attributed to internal strains, set up during the rapid cooling of the metal.

Sound Steel Selected at the Source

The above deals with the past. Let us now consider just what is being done to insure a better locomotive forging today and tomorrow.

The raw materials used consist of ingots and blooms of steel (and bar iron for the manufacture of such wrought iron forgings as are still required). Before placing an order with a new manufacturer for blooms or bar material, an investigation is made to learn definitely just what he can do when producing high quality material of the requirements specified. No order is placed unless we are reasonably sure he can deliver, and unless he agrees to abide by our inspection methods.

manufacture of the larger forgings. This of necessity means that an excellent quality of raw material is used in melting, for it must be remembered that in the acid open-hearth none of the phosphorus or sulphur is removed. We believe that a well made acid heat is preferable to a basic heat, one of the reasons being the smaller amount of slag and dissolved oxides present in the finished steel. Unetched specimens, such as shown on page 256, will bear out this statement.

Specially designed hot tops limit the pipe and draw segregation well toward the top of the ingots. Surface defects are removed by chipping. In making the top discard, the crop is removed by cold sawing, allowing 4 or 5 in. for a fracture test at the very center of the ingot, as shown in the illustration. Each ingot is given an individual identification number; drillings are then taken for chemical analysis as described later. This insures only the use of sound steel and material free from segregation. Should the analysis or fracture show a segregated or piped condition, an additional discard is made in the same manner by cold sawing and breaking until a sound unsegregated steel is discovered. This precaution is in itself a method of inspection rarely found in work of this nature, but we believe quite indispensable if highest quality is to be attained.

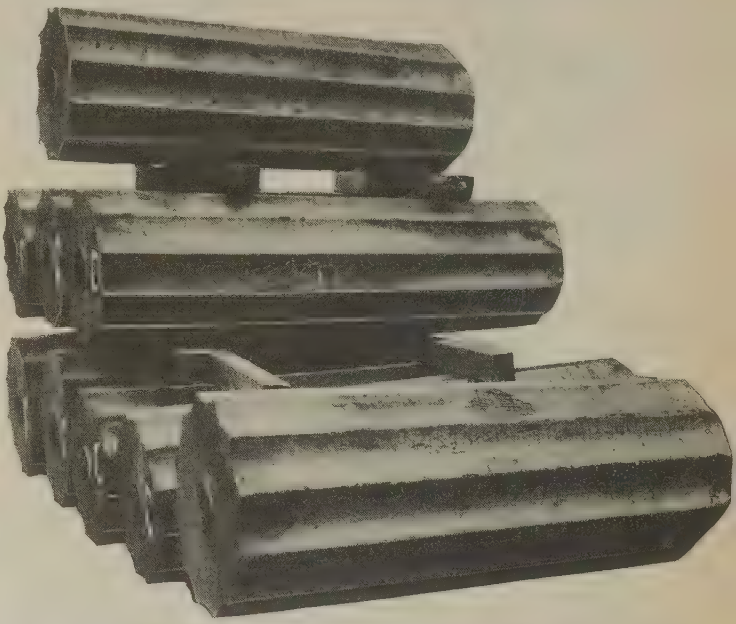
Ingots are charged into cold, oil-fired furnaces, and the heat applied slowly to avoid internal ruptures and to insure uniform penetration of the heat throughout the mass. Forging is done under a hydraulic press of 1000-ton capacity as shown in the previous article.

Deep-Etch Test on Forging Blooms

Most of the driving rods, crank pins and piston rods are made from rolled blooms or billets in alloy steel as well as straight carbon. It is our practice to make full-sized cross-section macro-etchings at the mill on all alloy steel heats. Three specimens, cut from different ingots, two being taken adjacent to the top discard and one from the lower part of the ingot, give a good indication of the quality of the heat. In this connection, it is interesting to note that the American Locomotive Co. was a pioneer in including the deep-etch requirement in a material specification.

As regards the macro-etching (or deep-etch test), it is next to impossible to establish a standard requirement. However, our mill inspectors, who are really specialists in this type of testing, have become sufficiently proficient so that the amount of questionable steel accepted has been reduced to a minimum.

The test has worked out to the advantage of the steel makers, however, who have been able to correct bad practices and thus produce more uniform, higher grade metal. We believe that the deep-etch test is the only one which will detect thermal ruptures produced during casting, reheating or blooming mill work—defects which we know were responsible for hundreds of failures in the harder steels when they were first being made.

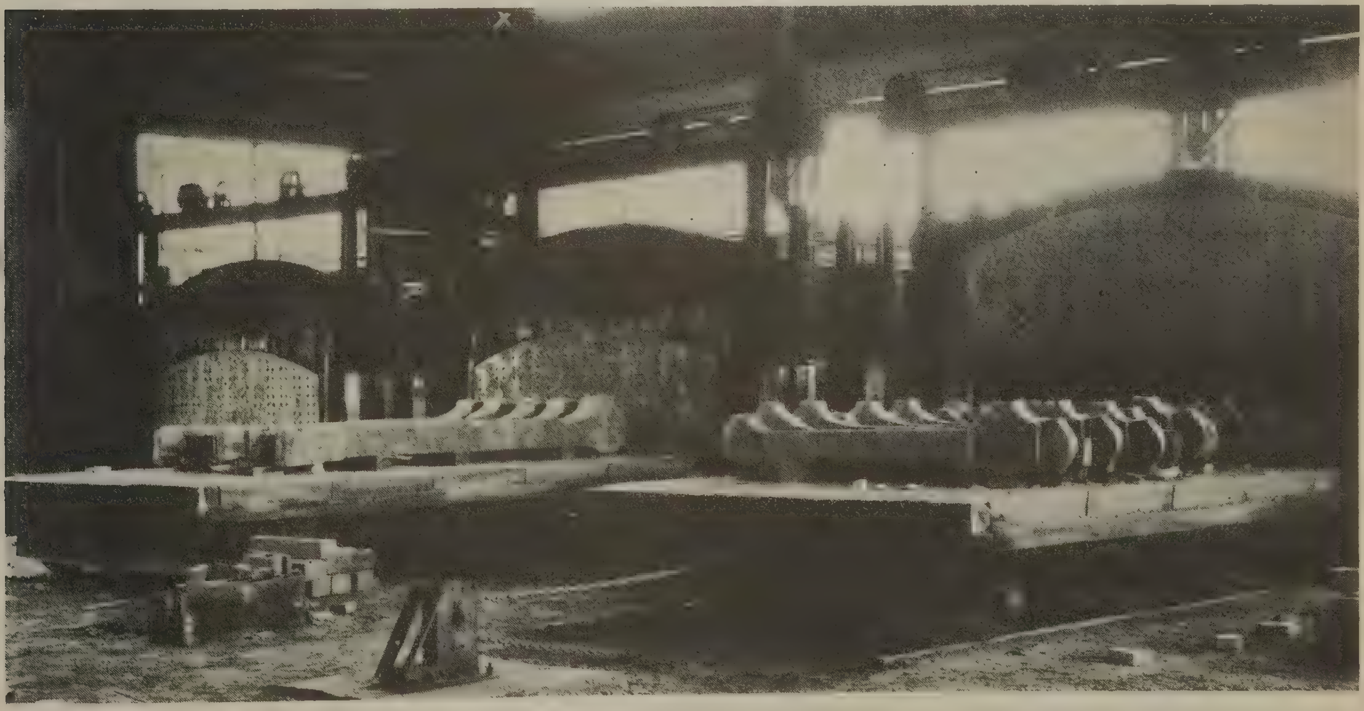


Hot Top Acid Steel Ingots Cropped for Fracture Test at Center

Carbon Segregation Limited to 15 Per Cent

Drillings for chemical analysis are taken from a ⅝-in. hole from three billets adjacent to the top discard and from one or more additional billets close to the bottom, selected at random in each heat of alloy or carbon steel. Samples are drilled half way from center to edge, as well as at the dead center. The analysis at the half-way point must show a composition within the chemical range specified, while the carbon content at the center must not vary more than 15 per cent from that actually found at the half-way point. Acceptance or rejection as regards segregation is based entirely on the check analysis; ladle analysis is reported for record only.

An unusual requirement of the American Locomotive Co. specification for straight carbon steel blooms



Side Rods Ready for Heat Treatment

be made from one top-cut and one bottom-cut billet in each heat. By "top-cut" billet is meant the section adjacent to the discard from the top of the ingot, while the "bottom-cut" may be taken from any other billet cut further down in the ingot. Minimum physical requirements specified for such tests are as follows:

	Annealed	Unannealed
Tensile strength, lb. per sq. in. ..	80,000	82,000
Elongation in 2 in., per cent.....	18	15

Tests are cut from full-sized cross-sections, and the manufacturer may furnish either annealed or unannealed specimens. When annealed specimens are furnished, the manufacturer is expected to anneal a full-sized cross-section of the billet, and take the test coupon therefrom.

Best heating and forging practice is of course essential to make a good part out of sound steel. In the article published in THE IRON AGE of Jan. 12, 1928, p. 127, the equipment was described whereby the ingots or billets may be heated according to a definite schedule and then pressed or forged in a way that the ingot structure is broken up, even to the very center of the piece. All heating is done under strict pyrometric control in furnaces which prevent direct contact of flame and metal.

Our forefathers handed down a legend that a reduction of at least four to one in cross-sectional area was necessary to produce a desirable forging from a billet or a reduction of five to one in cross-sectional area when making a forging direct from the ingot. An investigation recently conducted by the writer indicates that we can get equally as good results with a reduction as low as three to one from the ingot. This is of vital importance because we all recognize that the larger the ingot the greater is the tendency for segregation.

Heat-Treatment Practices

Forgings, after being allowed to cool in the air, are removed to the heat-treating plant, where they are given the desired heat treatment required to meet the various specifications.

Experience has proved that the straight anneal will not produce a desirable grain structure. Because of the large section represented by a locomotive forging, such large internal strains are developed on quenching that ruptures frequently occur. It has been demonstrated that in order to obtain the better grain refinement (which naturally means better physical properties, especially ductility) and to avoid the terrific strains set up in quenching, it is necessary to normalize and anneal. This more dependable practice is well worth the cost of such a treatment.

Co., therefore, is to normalize and anneal both the alloy and straight carbon steels unless otherwise specified by the customer. The forgings are treated in oil-fired furnaces, where the flame does not come in direct contact with the metal. The rod or axle is supported on cast iron blocks about 4 in. from the hearth, as shown in the photograph; a little space is also allowed between each piece so as to permit complete radiation around the mass. The piling of more than one tier on top of the other is not permitted. To normalize we hold the forging at the desired temperature a time equal to 1 hr. per inch of thickness or diameter, withdrawing the car and cooling rapidly on the car to a temperature below the critical range. A subsequent anneal at a temperature below the critical is then given to meet the specified physical properties.

To assist in getting uniform structure in heavy masses it is the practice to hollow-bore round forgings; the larger the cross-section the larger the diameter of the hole. A good rule is to have the inner bore one-fifth the outer diameter. This not only promotes uniform heating and cooling, but removes that portion of the steel where physical defects are most often found. Even this expedient does not remove the danger of thermal rupture in quenching a dense alloy steel forging 8 in. thick in the wall.

Testing the Finished Forgings

For testing it is the practice to forge (attached to the forging itself) a prolongation of a sectional area equal to that of the body of the forging. Such prolongations are made on approximately 25 per cent of the production so as to enable the inspector to choose at random those which are to be tested.

A modern laboratory permits complete physical, chemical and microscopical testing.

Microphotographs and the corresponding physical and chemical properties shown in this article are representative of the results being obtained. The size of the rod, axle or pin from which each test is made is also of importance, because while such structures may easily be duplicated in laboratory pieces, it is not so easy to get them in commercial production on heavy masses, sampled half way from the center to the surface.

That the views shown are by no means special may be inferred from a letter recently received from the engineer of tests of a Western railroad. He is one of the few who specify the grain size as determined under the microscope. His laboratory had independently investigated 131 forgings on 35 locomotives delivered during the course of several months, and the verdict was that the uniformity was very satisfactory.

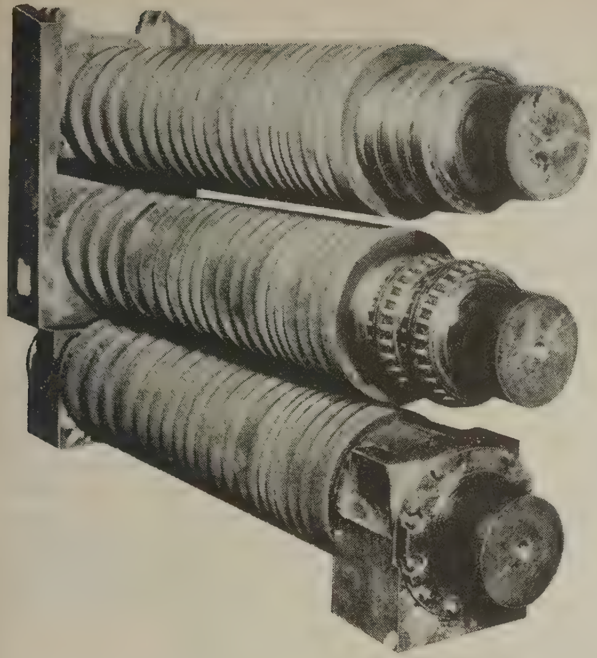
Water Shipments of Steel Greatly Increased in 1927

THE issuance by the United States Engineers' Pittsburgh office of the report of the commerce of the Allegheny, Monongahela and Ohio Rivers within the jurisdiction of that office, for December, completes the record for 1927. Of particular interest to the iron and steel industry is the expansion in the use of the inland waterways for the transportation of its products.

The total tonnage moved in the Allegheny River in 1927 was 2,955,695 net tons, and included 13,867 tons of iron and steel products; of the total Monongahela River tonnage of 24,492,968 tons, the iron and steel item was 689,087 tons, and in the 9,624,134 tons moved on the Ohio River there were 697,262 tons of iron and steel products.

Figures of the Ohio River tonnage represent closely the shipments beyond the confines of the Pittsburgh district and as they pertain to iron and steel are a good measure of the efforts Pittsburgh district steel companies have been making to break through the cordon of high railroad freight rates and to find an outlet for their products beyond the limits imposed by the railroad freight charges.

The total traffic of the Ohio River as reported to the Pittsburgh office by lock-keepers between Pittsburgh and Wellsburg, W. Va., locks beyond latter point being under the jurisdiction of the Huntington, W. Va., office, for 1927 of 9,624,134 tons, compares with 9,306,900 tons in 1926 and 7,647,325 tons in 1925. The 1927 Ohio River total iron and steel shipments of 697,262 tons compares with 315,221 tons in 1926 and 377,403 tons in 1925. The gain in total Ohio River tonnage in 1927 over 1926 was 311,234 tons; the increase in iron and steel tonnages was 382,041 tons. In other words, last year's total gain in Ohio River traffic was supplied by iron and steel. The combined total of Ohio River shipments of iron and steel products for 1925 and 1926 was 692,624 tons, or 4638 tons less than the 1927 total.



Roller Bearings Cut Down Power Waste

As Applied to Roll Necks, Pinion Stands and Hot Saws in Steel Mills

BY S. M. WECKSTEIN*

CONSIDERING the percentage of driving power that is wasted in overcoming friction in the average type of machine used in the production of steel, it is not surprising that the possibilities of anti-friction bearings as applied to this service are of such great importance from the standpoint of operating and maintenance economy. The idea of applying them is not particularly new, but the difficulties in the way, especially in the case of the heavy-duty machines such as rolling mills, hot saws, finishing mills, and similar types were so great, that up until a comparatively short time ago it was regarded as impractical.

About three years ago, however, the engineers of the Timken Roller Bearing Co. started a series of experiments on a large scale, with a view toward developing a type of bearing that would successfully meet all the very exacting requirements of the service. Since the company is itself a large producer of steel, its own plant became available as a laboratory where the bearings could be tested under actual service conditions over any period of time considered necessary to assure accurate and definite information. As a result of these experiments, bearings have been produced for a number of different services, the most notable among them being a type especially suitable for the roll necks of rolling mills.

Since the first development of these bearings, a number of installations have been made in mills of various types all over the country, and results in the way of increased production, decreased operating costs, and improved maintenance economy have been obtained that have more than justified the predictions made for the bearings in the early stages of their development. This is true not only in the case of rolling mills, but of a number of other types of machines to which either these, or bearings of a similar nature, have been applied. Before going into details concerning these results, a description of the bearings themselves and their methods of application should be interesting if for no other reason than because it gives the best idea of the way in which the difficulties and limitations imposed by the service requirements were overcome.

Roller Bearings Suited to Roll Necks

PROBABLY the most difficult application, from the standpoint of mechanical as well as of load requirements, was that made to the roll necks of various types of rolling mills. However, as can be seen from Fig. 1, the bearing as actually developed for this purpose is exceedingly simple, both in construction, and as concerns the mechanical operations necessary to install it. It consists essentially of two double cones or lower races, four sets of tapered rollers with individual cages, and three cups, one of which is double. The assembly is a simple three-part operation, the cups, cones, and rollers being all assembled inside the bearing chuck. Therefore, the complete assembly may be slipped on and off the roll neck as a unit without in any way disturbing the bearing adjustment.

Since the projected area of the two double cones is nearly equal to that of the roll necks, the unit pressure per square inch permits a loose fit of the cones on the neck without any danger of chafing. By virtue of this construction, not only is the assembly of the rolls in the mill rendered a simple matter, but their removal, or the removal or replacement of a bearing, is also facilitated.

While this is especially true in the case of new mills, which can be designed with particular reference to this type of assembly, it is also true of such existing mills as lend themselves to an anti-friction application. No great modification in construction is necessary in such cases to permit the replacement of the bearings formerly used by the new roller bearing. Fig. 2 shows a typical method of mounting the rolls in the mill.

Another interesting feature of these bearings is their compactness. Their width has been kept well within the limits imposed, without any sacrifice of their ability to withstand any of the radial or thrust loads likely to be encountered in service. With regard to the latter type of load, experience has shown that the thrust capacity of the bearings is such that they can easily handle the maximum peak thrust loads met with.

The construction of the bearing has permitted the

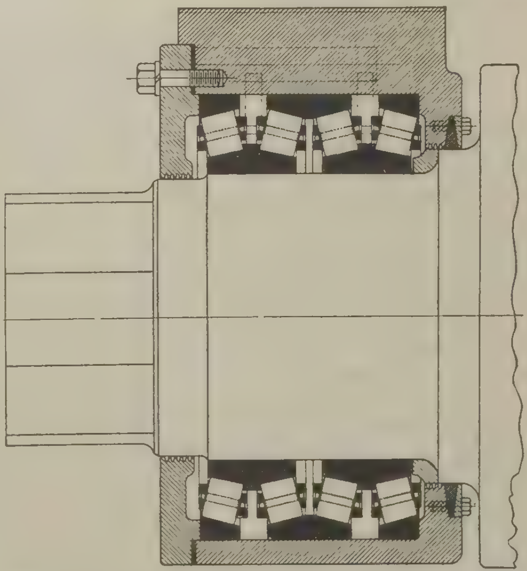


Fig. 1—Section of Chuck and Bearing Developed for Use on Roll Necks

---

*Industrial equipment engineer Timken Roller Bearing Co., Canton, Ohio.

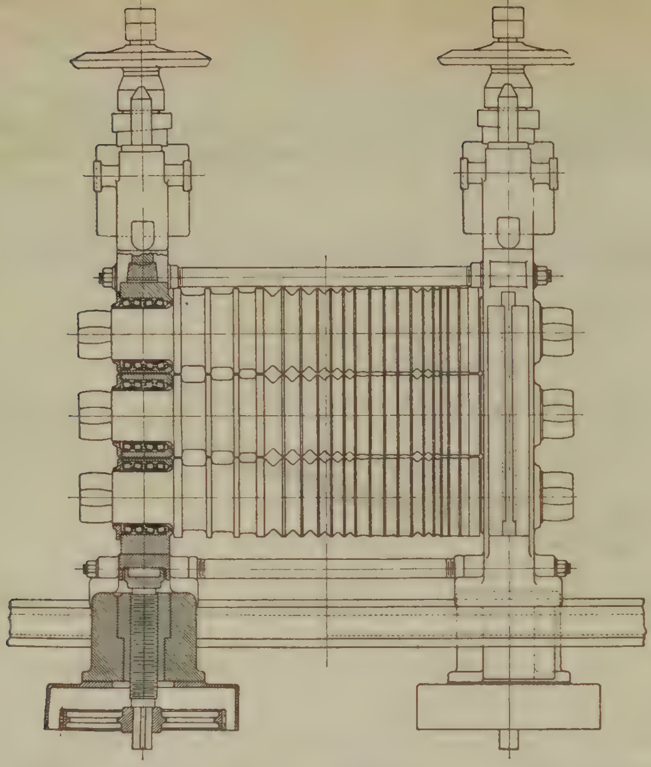

Fig. 2—Typical Application of Bearings to a 3-High Rolling Mill

incorporation of yet other features that add greatly to its effectiveness from a service standpoint. The chuck can be designed so as to form a practically grease-tight inclosure around the roll neck itself, with the result that grease can be forced into the assembly until the pressure becomes such as positively to prevent the entrance of either water or scale into the bearing or housing. The same holds true, of course, in the case of dust or other foreign matter that may be deposited on the housing from the mill atmosphere. As a result the necessity of frequent inspections or renewals of the lubricant is eliminated.

Some of the Advantages Claimed

The advantages obtained from the use of these bearings may be listed in the order of their importance: Improved continuity of service, considerable saving in power consumption, and decreased lubrication and maintenance cost. With regard to the first, experience has already proved that not only are the delays from shutdowns due to bearing failures or troubles materially decreased, but the machines can be worked steadily over longer periods of time without the necessity for inspecting or rehabilitating the bearings. In fact, the frequency with which the machine is out of service for any such cause becomes a matter of how often the rolls must be re-dressed instead of how often the bearings need attention.

As to the second point, the early experiments showed that savings in power consumption up to as high as 60 per cent might be expected, a prediction that has since been borne out by the average savings obtained from a number of installations having widely varying service conditions. In one case on record where accurate operating costs were kept, it was found that the cost of power for operating a 16-in. three-high, breakdown mill with plain bearings amounted to $8,029 for a year, while the cost for the same mill under identical working conditions, but with Timken bearings replacing the plain ones was only $4,335.66 for the same length of time, or a saving of $3,693.34 for power. These figures were obtained in a plant where the kilowatt-hour rate is fairly representative of that paid by the average steel plant. Another case can be cited where the saving in power required to operate a mill formerly equipped with plain bearings amounts to about 62 per cent.

The improvements claimed in the matter of maintenance and lubrication are just as marked, and have been equally justified by the results obtained in practice. Concerning the former, while conditions in various plants vary to a degree that prevents the making of any definite statement as to the percentage of saving that can be expected in any particular case, there are certain factors common to every case that will serve to give an indication of where some of the savings may be looked for. For instance, the costs for babbitt and that for the labor required to re-babbitt plain bearings are totally eliminated and, as has already been intimated, it is a much simpler matter to handle the bearings off and on to the roll necks, so that labor costs for this operation should be less. The same difficulty of determining percentage savings exists in the case of lubrication cost, and for the same reasons. It may be said, however, that results indicate that the comparative ratio seems to be of the order of one to ten, in favor of the roller bearing.

Roller Bearings for Pinion Stands Simpler

THE load characteristics of pinion stands are such as to permit the use of a bearing that is simpler in construction than that designed for mill roll necks. Not only are the radial loads smaller, and less given to sudden high peaks, but the thrust loads, although they are somewhat the same in character, are of less magnitude, being principally those reflected through the couplings from the roll necks on one side, and from the speed reduction gears on the other.

The bearings used in this case may be either of the single or double type, depending on load conditions. That is, they may consist either of a single cone, tapering toward a central apex, two sets of rollers and cages, and two individual cups, one for each set of rollers, or of two double cones with four sets of rollers. One method of mounting is shown in Fig. 3. The same simplicity characterizes the mechanical details of mounting as that described in connection with the roll neck bearings, with the addition that the construction of the chuck or housing may be even simpler because of the lighter service requirements.

Conditions for Hot Saws Hard to Meet

LOAD characteristics of hot saws are such as to make the bearing requirements of this class of equipment very difficult to meet. In the first place, the high speed of the saw, coupled with the fact that heavy peak loads are imposed with great suddenness, requires that the saw arbor be very rigidly held with regard to either vertical or horizontal movement, because otherwise the severe thrust loads imposed by the natural whip of the saw blade under load would be increased out of all proportion, and the saw blade itself might be destroyed.

In the second place, the operating temperatures are high enough to exert a decided influence on the performance of the saw. Owing to the construction which must be employed, it is unavoidable that enough heat to

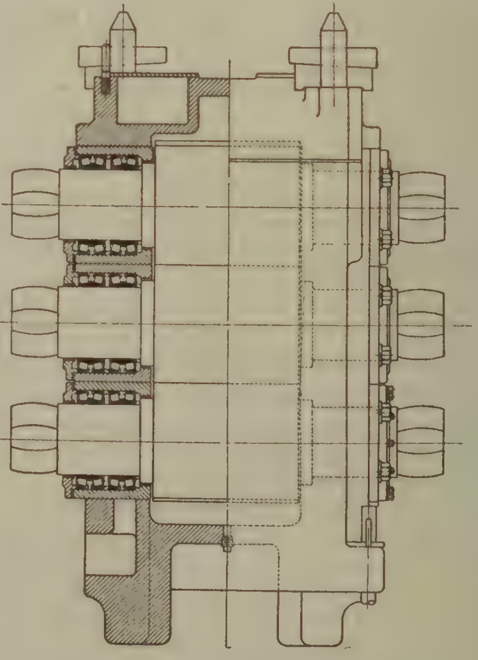

Fig. 3—Method of Applying Bearings to Pinion Stands

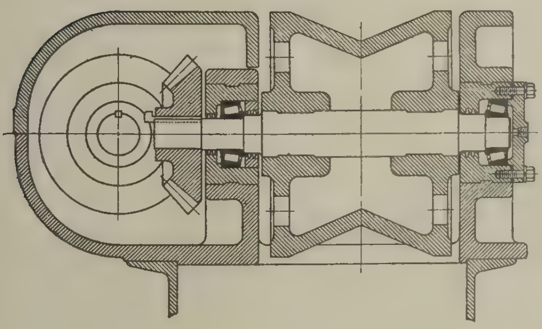

Fig. 7—(Above) Bearing Mounting on Tube Mill Table Roller

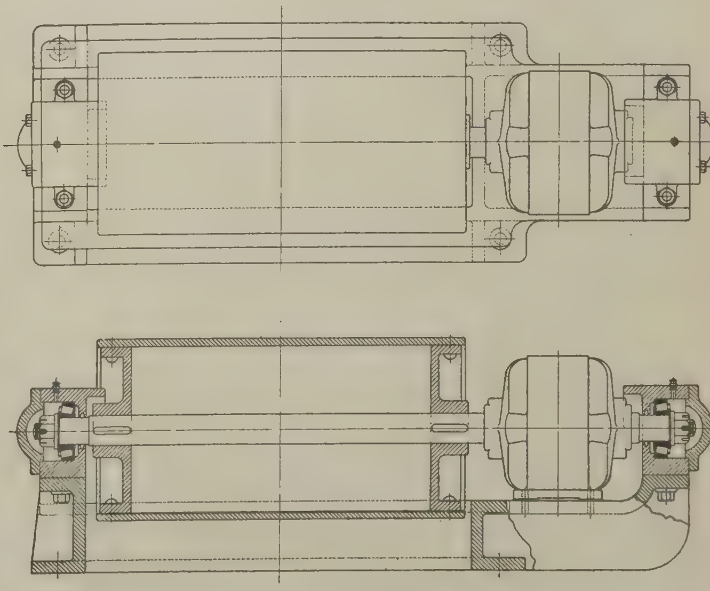

Fig. 8—(Below) Indirect Mounting on Hot Bed Table Rolls

cause material expansion will be transmitted to the saw arbor proper, and thence to the driving shaft. Provision must be made for allowing this expansion to take place without affecting the rigidity with which the saw arbor is held. Heat in addition makes the lubrication problem somewhat more involved than is ordinarily the case.

A typical mounting of tapered roller bearings which has been developed to meet these conditions is shown in Fig. 4. The bearings used are of the single type arranged with opposed tapers to take care of the thrust loads. By examining the layout it will be seen that every precaution has been used to insure absolute rigidity at the saw end of the arbor. The bearing cones are a press fit, and are held in place horizontally by spacers. The outside cone is further held by a threaded nut that clamps the assembly in place. It will also be seen that the construction of the housing and end caps is such as to provide for a circulatory lubrication system.

The matter of shaft expansion has been taken care of by the method of installing the outboard bearing. In this case the cones are keyed to the shaft, allowing the latter to float in the bearing. Therefore, the shaft can expand longitudinally through this bearing, so as to compensate for the rigidity with which it is held in the inboard bearing. At the same time such expansion cannot disturb the horizontal relation of the saw arbor to the work.

This type of installation is already working successfully in several instances where the saws have been used in actual production work over quite a long period of time. Results obtained from these installations indicate that average bearing life should be longer, with less expense for repairs and maintenance, and that, on the whole, lubrication costs are improved. The degree of improvement depends somewhat on the kind and method of lubrication used. Where grease is the lubricant, the ratio is about one to ten in favor of the tapered roller bearing, and even where oil is used, the improvement is of a material character.

Auxiliary Equipment Can Use Roller Bearings

IN addition to the major machines, which have just been described, several bearing arrangements have been developed which are suitable for use on various types of auxiliaries. As in the other cases, the bearing arrangement for the different types has been more or less conventionalized, as a result of thorough-going studies of load conditions and service, but it is adaptable to modifications to meet special requirements. Of the auxiliaries, the ones lending themselves best to bearing application are the table rolls used in connection with the various types of mills. Several arrangements have been developed for various rolls, a few of which will serve to give a general idea of the methods of application.

A characteristic layout for a mill table roller is shown in Fig. 5. In this case, two single bearings are mounted back to back, the cones being a press fit on the roller shaft. The reason for this arrangement is, that while the majority of the load is of course radial, a fair amount of thrust is caused, when the rollers are suddenly reversed, by the tendency of the driving pinion to try and back out of mesh with the side shaft gear. This condition is of course aggravated when the reversal takes place with the roller loaded, as is often the case. The bearing layout for approach table rollers is practically the same as that just described, because since the rollers are nearly always started under load, the loading characteristics are, with the exception of reversals, identical.

Two applications where the bearing problem is solved very easily are shown in Figs. 6 and 7 respectively. In both these cases the loads, both radial and thrust, are very much lighter, and the construction of the bearing supports is such as to more easily assure proper bearing alinement—consequently, a single bearing can be used.

In the case of the hot bed table rolls for strip mills, a mounting similar to that shown in Fig. 8 is suggested as good practice. The indirect method of bearing mounting is used, that is to say, the bearings are so mounted that a slight expansion of the table rolls, and possibly of the housing, due to heat radiation from the load, will cause the bearing cones to move axially away from the cups, and eliminate the possibility of the bearings seizing. This method of mounting has proved very successful in service.

Similar applications have also been made to other auxiliary equipment such as tilting transfer tables, blast furnace bull wheels, straightening machine idler rolls and piercing mill holding chucks, to give a few examples. Since both the load characteristics and the bearing arrangement in most of such cases would merely duplicate those already described, particular details concerning them would not be especially interesting. They are merely mentioned to give an indication of the extent to which the anti-friction idea can be carried in the average steel plant.

As to the results obtained in improving operating expense and practice by applying roller bearings to auxiliaries, while individually they are naturally less remarkable than in the case of roll neck bearings, in the aggregate they show a proportionate gain from both standpoints, and for very much the same reasons. In fact, a plant where even the auxiliaries alone have been so equipped may reasonably expect to find that the power conditions and general operating economy have been materially improved.

Boiler-Corrosion Problems

PROGRESS report of sub-committee No. 5 on "Corrosion of Boilers and the Effect of Treated Water in Accelerating or Relieving These Troubles" was presented recently by Frank N. Speller, metallurgical engineer National Tube Co., Pittsburgh, chairman of the committee, during the annual convention of the American Society of Mechanical Engineers at New York. The following list of boiler-corrosion problems for investigation was approved, the problems being arranged approximately in order of importance:

1—Determine the corrosion rate and hydrogen-gas evolution *in the absence of* dissolved oxygen through the range of acidity and alkalinity in general practice and with a temperature range from 140 to 450 deg. Fahr., on the heat-transfer surfaces of the water cycle in steam plants. In this problem the determinations should be made on distilled water and on water containing varied amounts of the common impurities.

2—Repetition of No. 1, with dissolved oxygen present in varied amounts within range usually found in practice. Investigation and development of method for determining very small amounts of oxygen in solution.

3—Determine in the field dissolved oxygen in locomotive and stationary boilers at various points in the circulating system. Include boilers of various types. The field tests on boilers should include some of the same type operating at various pressures.

4—Study the variations in hydrogen-ion concentration, and alkalinity of acidity by titration at boiler temperatures, compared with these factors in the same water at normal temperature (68 deg. Fahr.). Investigate the influence of high concentration of common salts on these variables at high temperatures. An automatic recording device for measuring hydrogen-ion concentration in steam boilers under operation is desirable.

5—Study in laboratory and field the formation of protective films deposited from water on heating surfaces. The relation between dissolved oxygen, alkalinity, chlorides and protective scale formation should be investigated.

6—Study pitting found under boiler scale, particularly in locomotives operating in certain geographical sections.

7—Electrolytic prevention—cause and effect.

8—Corrosion in boilers, caused by organic materials.

9—Study action of inhibitors (organic and inorganic) at boiler temperatures.

The sub-committee appointed to study plans for an experimental boiler to be used in carrying out certain parts of the boiler-water studies has been at work, but has not yet made a final recommendation.

Measuring a Billionth of an Inch

Device Required to Study Changes in Length of Permalloy—When Magnetized Has Extreme Sensitivity

EQUIPMENT to measure changes in length of the order of a billionth of an inch has recently been devised by P. P. Cioffi of Bell Telephone Laboratories. If it were possible to get paper so thin, over a million sheets piled on top of each other would be required to equal a piece of ordinary tissue paper in thickness! This length is just about a tenth of the diameter of an atom.

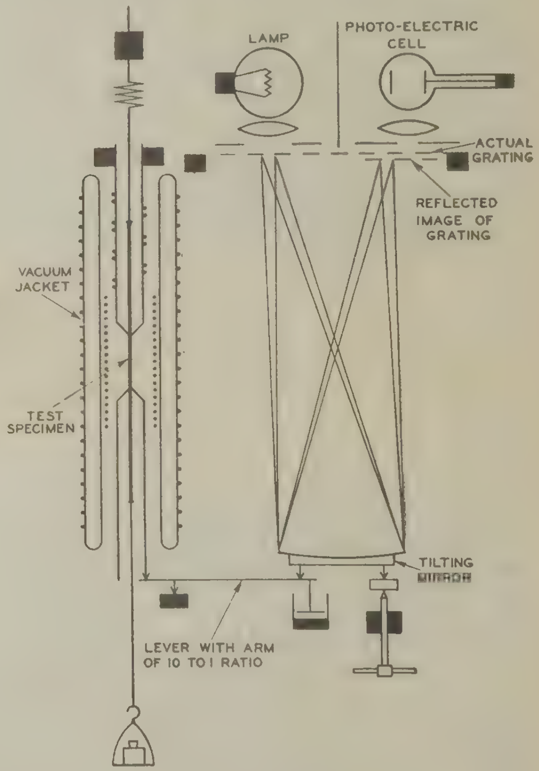
The need for so refined an instrument arose from studies of magnetic materials, a subject of the greatest practical importance to the American Telephone & Telegraph Co. Magnetic materials are required not only for the many forms of telephone receivers but for many types of equipment associated particularly with long distance telephony.

At Left—Equipment to Measure Atomic Distances Designed by P. P. Cioffi, of Bell Telephone Laboratories

Until recently it had been thought that pure iron was the most magnetic material it was possible to obtain. When G. W. Elmen of Bell Telephone Laboratories discovered permalloy, all previous theory was overthrown. This is an alloy containing 79 per cent of nickel and 21 per cent of iron, which has magnetic qualities far superior to pure iron alone. Cioffi's apparatus is used in building up a new theory to account for these remarkable properties.

Two fundamental facts were available as foundational material. When a metal is magnetized a loss occurs which evidences itself as heat. In addition a small change in the dimensions of the metal is detectable. The change is not over one part in 100,000 but is in opposite directions in iron and nickel; the former expands while the latter contracts in a magnetic field. The myriad tiny atoms composing the metal apparently turn or twist under the action of a magnetic field and, while those of iron turn so as to make the total length greater, those of nickel reverse the action. Permalloy, which neither contracts nor expands and shows very little heat, may be pictured as the well ordered scheme where little groups of iron and nickel atoms cooperate in their movements so that there is no wasted effort. The iron atoms acting in one way slip by the nickel atoms acting in another so that friction is a minimum.

The equipment is designed to measure changes of length in a piece of wire about 4 in. long. One end of the 4-in. section is fixed in position and to the other end a clamp is attached which connects to the short arm of a lever. The long arm of this lever tips a concave mirror as the wire changes its length. Light from an incandescent lamp, after passing through a suitable lens, falls on the mirror at a small angle from the perpendicular and is reflected back to a position somewhat offset from the lamp, where a photoelectric cell is mounted. Between the light source and the mirror is a grating with alternate opaque and transparent lines, each half a millimeter thick. The image of this grating falls on the mirror and is reflected back to an extension of the same grating in front of the photoelectric cell. When the images of the transparent lines are reflected back to another group of transparent lines, full light will fall on the cell. When, on the other hand, they fall on the opaque lines, no light will be transmitted. Only a very small movement of the mirror is required to cause this change from full light to no light. The photoelectric cell gives off a current proportional to the light falling on it, and this current is indicated by a sensitive galvanometer. The galvanometer indication thus serves to divide the width of one bar of the grating into a large number of smaller divisions.

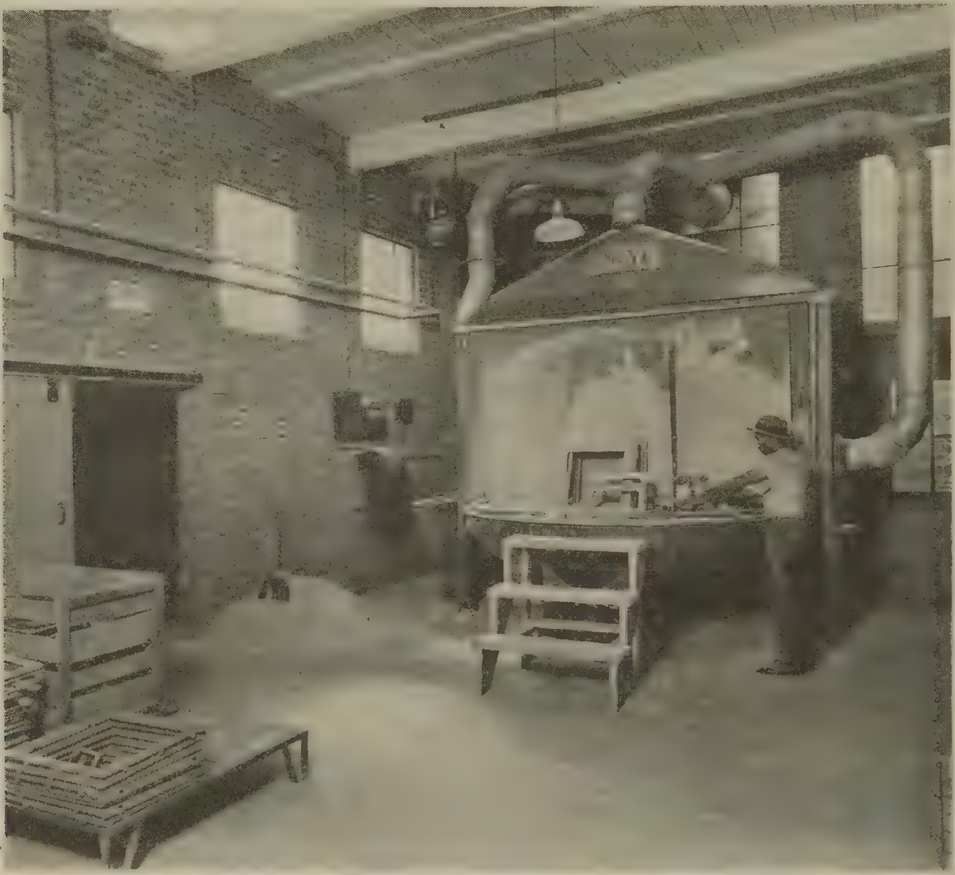


At Right—Diagram Showing How Small Change in Test Specimen Is Magnified at the Photo-Electric Cell

As imperceptible temperature changes cause expansion sufficient to tilt the mirror, every precaution is taken to keep the temperature of the wire constant. It is surrounded by a vacuum cylinder like a thermos bottle with an opening at each end, and in addition a special electrical compensating coil is used to maintain constant temperature. The entire equipment is mounted on a spring suspension so that building vibrations will not affect it.

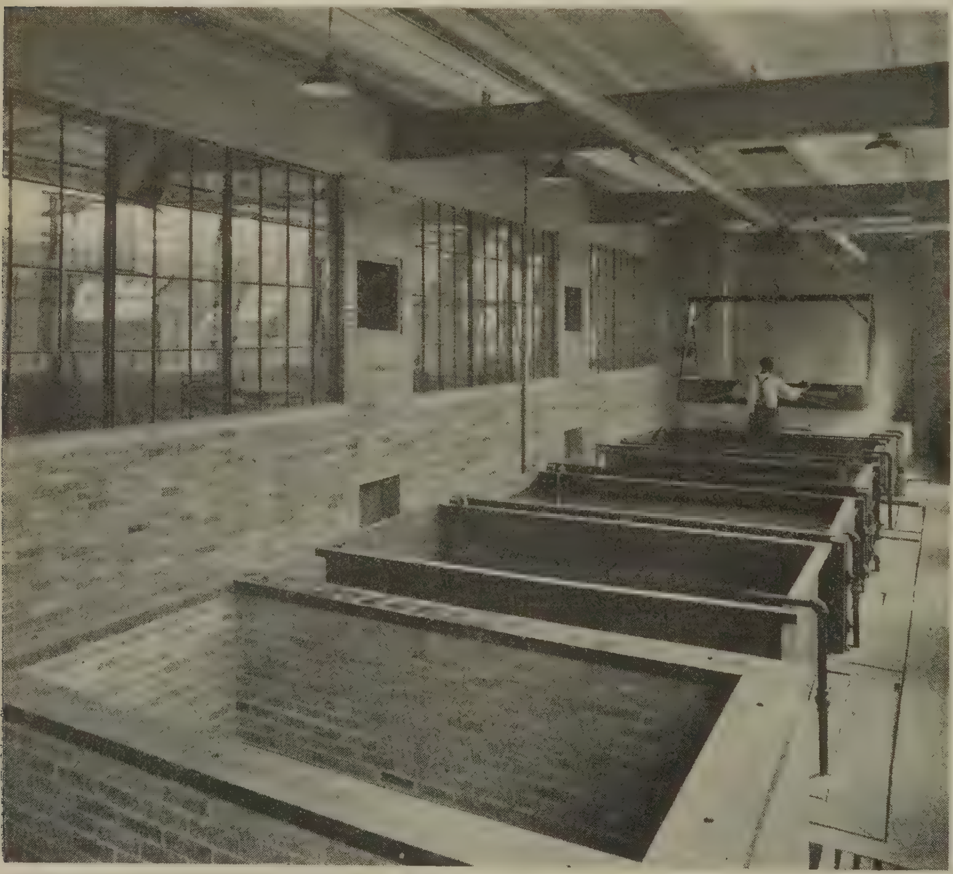
Enameling Metals With the Aid of

Plant Designed for Minimum



Operating the Sand-Blast Equipment. The door at left leads to the sand bin, which is protected from the weather. Lift-truck skids for handling material will be noted in the foreground

Pickling Room, with Brick Dryer in the Foreground. Overhead is a tramrail with electric hoist and special non-corrosive tray for handling material into and out of the vats and dryer



CONVENIENT handling of materials was made a primary factor in the layout of the new plant of the Louisville Enameled Products Co., Louisville, Ky., as will be seen from the plan. The plant is one story, except for the office at one end. The use of conveyors forms the central feature of the design, while provision for expansion has been made. The building is of brick and steel, 120 x 168 ft., with ample natural lighting.

Castings or sheets for enameling go through the sand-blast room, which has a concrete sand bin close alongside arranged for direct unloading from railroad cars. The sand blasting unit, made by the Sly Mfg. Co., Cleveland, has a rotating table on which material is passed into the blasting chamber.

Pickling takes place in a separate room, served by an overhead tramrail with electric hoist. Material on trays is dipped in the successive tanks one after the other as needed and then is dried. The tramrail extends out to the black stock storage, to facilitate handling material into and out of the pickling process.

Enamel is mixed in the mill room, which contains three 500-lb. mills and two of 300 lb., with space for an additional mill. This room and the pickling room are both close to a dip tank and a line of four spray booths in which a second coat of enamel is sprayed upon the parts requiring it.

Pickle Room Has Large Over-Capacity

Monel metal baskets are used in the pickle room, which has been operating only 5 hr. a day to serve other departments operating 10 hr. Considerable expansion in output is correspondingly available. A double-strength cleaner is used and reports indicate freedom from rusting. Two "venturafin" steam units in the walls of the room eliminate vapor. A dryer is used with exposed gas burners, which are operated merely during the time that the basket of ware is in the dryer. Efficiency in drying is claimed from the fact that there are no covers or hearth plates to be heated.

Automatically Controlled Conveyors

Handling Costs and High Output

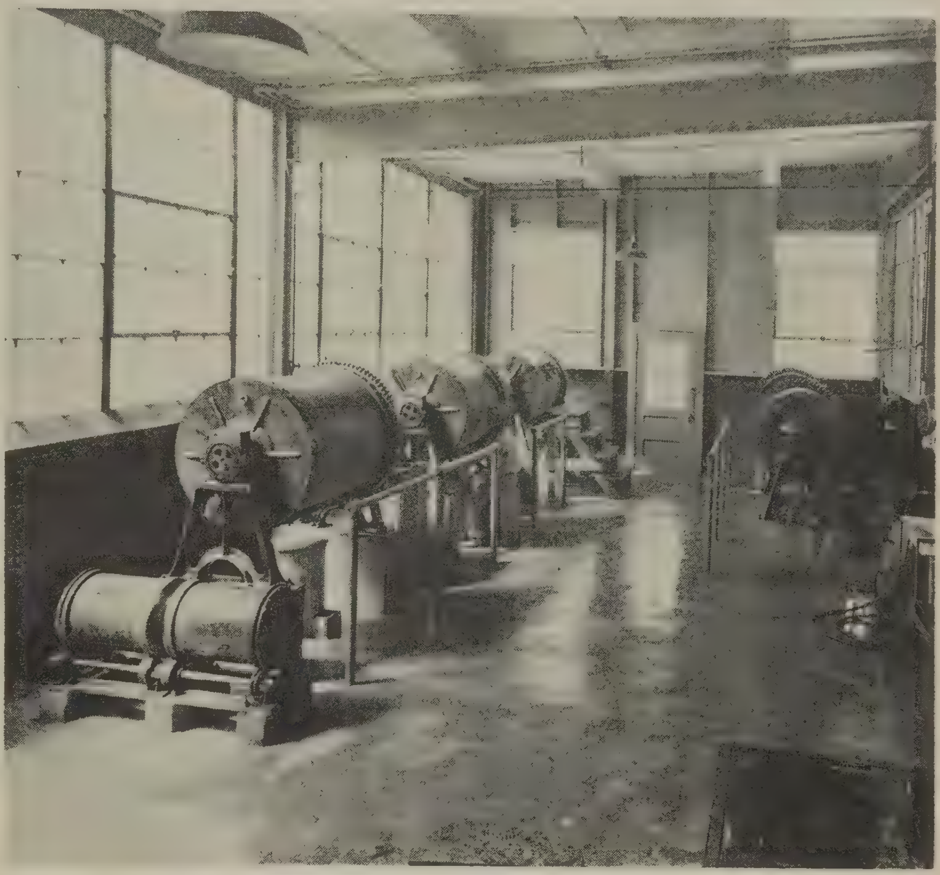
As the mills in the mill room are set with a valve clearance of about 36 in., the average-size 33-gal. can can be put underneath for unloading the mills. They are not so high, however, as to be difficult to operate. The cans are equipped with rollers for ease of handling. For loading the mill, 100-lb. cans are used. The mills all have direct electric drive. The floor of this room slopes from the center to two sides, which permits flushing without leaving water around. There are two 25-lb. laboratory mills for experimental work on colors.

There is an enamel dipping tank for flat sheets and other material, which has a revolving rack on top. The dipper hangs the dipped ware on this rack so that it will drain back into the tank. After one side of the rack is filled, it is turned around for loading the other side. By this time the ware on the first side has dripped sufficiently so that it is ready to be placed in the dryer. The dip tank itself is porcelain enameled in a blue ground coat.

Two of the spray booths are 8-ft. booths with two pedestals in each. This is for the purpose of supplying the sprayer with continuous work and permitting him to devote all his time to spraying. A helper loads and unloads the pedestals, while the sprayer, using one gun, steps back and forth from one to the other. This arrangement has yielded large production. De Vilbiss spraying units are used.

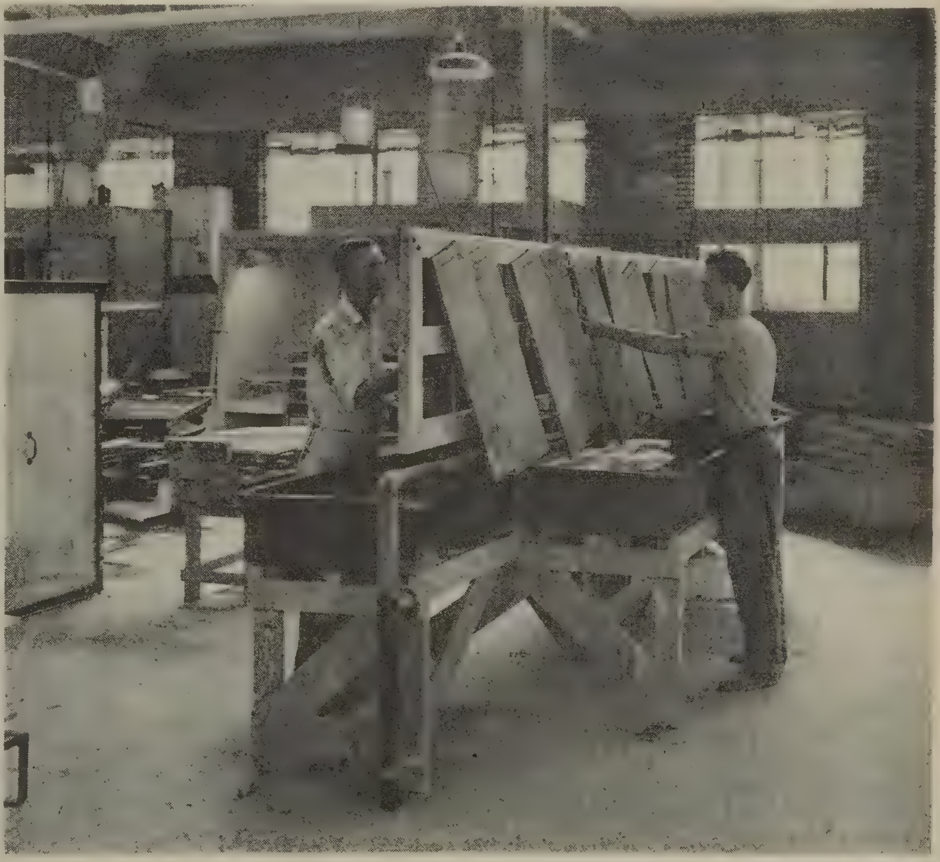
Power Conveyors Make Drying Automatic

Conveyors are used to carry the ware into the dryers immediately after spraying. All sizes and shapes of castings and sheets are run through this equipment. A hurricane dryer is used, 40 ft. long, with material passing through it on a power conveyor. Air is blown through a duct in the bottom of the dryer at 3000 cu. ft. a minute, being heated by steam to 190 deg. Fahr. With steam pressure varying from 10 to 15 lb., the temperature of the dryer is kept at about 170 deg. The speed of the conveyor is varied from 15 in. to 5 ft. a



The Five Mills Were So Placed That They Could Be Discharged Directly into 33-Gal. Cans. These cans are on casters to facilitate handling. In foreground at left is a double grinding cylinder

Dipping Tank with Rotating Rack. The man at left is placing a dipped piece upon the rack. The man at right is removing pieces after dripping. In rear is one of the spray booths



min., depending upon the character of the material going through.

A small room-type dryer along one side of one of the hurricane dryers is heated by radiation from the latter. This is used for storing clean castings and for other miscellaneous drying needs. Sliding doors permit access to any part of this room, which is 30 ft. long.

Burning on the Enamel Coatings

A box-type firing furnace heated with General Electric units, and measuring 5 x 12 ft. inside, is installed in the center of the plant. Provision is made for a second similar unit later. Cars are used to hold the material being fired. The connected load is 340 kw. on a 220-volt circuit. The heating elements are placed top and bottom, with none in the sides. In this furnace, cast iron ground coats are burned on at 1360 deg. Fahr., and cover coats at 1300 deg. At these temperatures the loading forks are double-decked, the furnace being loaded clear up to the door. The burning operation is reported to take 16 min.

Cast iron white is put on with one ground coat and one cover coat. Many of the colors are put on in one coat direct on the iron. These cast iron pieces are burned at night, as the furnace is used on the day shift for burning coatings on sheet iron and steel.

For this latter purpose, a temperature of 1580 deg. is used for the ground coat and 1520 deg. for the cover coat. The furnace is set automatically for 2½ min. for the white and 4 min. for the ground coat. Absence of warping is reported. By using long-point bars it is possible to place long narrow pieces on edge between the points. This permits the use of much larger quantities of material at a single burning. The furnace is turned on at 7 a.m. on Mondays and in 25 min. is up to the temperature for sheets, production in it being started at 7:25 a.m. At the end of the shift, the controls are set for cast iron and by the time the night force arrives the furnace is down to the required point.

In laying out the equipment for this plant, particular pains were taken to arrange the apparatus for the easiest operating conditions possible. The firing furnace was so placed as to give the burners the advantage of daylight on the forks. The conveyor dryers were arranged to bring the ware conveniently up to the forks. The whole design, layout and installation were the work of the Ferro Enamel Supply Co., Cleveland.

---

Consumption of steel in Argentina during the past two and one-half years has had a steady growth, according to a statement prepared by the Iron and Steel Division, Department of Commerce, based on a report received from Commercial Attache H. Bentley MacKenzie. The increased use of steel is attributed largely to greater activity in the building trades and the expansion of industries fabricating a variety of steel products from imported steel.

Although there was a decline in the number of persons employed in Illinois factories in December, wages remained at peak levels, according to a report by the bureau of labor statistics of the Illinois Department of Labor. The number of factory workers in December touched the lowest point of any month in five years.

By-Product Coke Capacity Gains Little

FIGURES on by-product coke oven capacity, revised by The Iron Age *and given below, show that construction of new capacity paused after the unusual activity of 1926. While ovens now standing and in course of construction have capacity for carbonizing 83,826,638 net tons of coal annually, with a resultant estimated yield of coke of 58,555,726 tons (compared with 81,663,703 tons and 57,631,422 tons respectively at the end of 1926), there actually has been more dismantling than construction, since the total number of ovens built and building as of Jan. 1, 1928, is 12,756 compared with 12,833 one year before. At the end of 1927 there were 238 ovens under construction.*

Pivoting Type of Ingot-Turning Machine for Furnaces Heating Steel to Be Pierced for Making Seamless Tubes

INGOT-TURNING MACHINE

Labor Saving Equipment for Furnaces Serving Pilger Tube Mills

IN manufacturing seamless tubes on Pilger mills, tapered round ingots of a diameter approximately one-half larger than the finished product are generally used. These are heated, preliminary to the piercing process, in a continuous heating furnace having a long inclined hearth. The taper on these ingots prevents their rolling down the inclined hearth in a line parallel to the walls, their natural path being rather in the arc of a large circle.

To meet this situation it has been customary to provide the side walls of the furnace with a series of doors or poke holes, spaced 3 or 4 ft. centers. Through these holes bars are inserted and the ingots thus straightened on the hearth and rolled down toward the discharge end. This is all done by hand labor. The extreme heat as well as the size of ingots required for large tubes makes it difficult to maintain a suitable force of men, and the operation is slow and in general unsatisfactory.

To overcome this difficulty, the Wellman-Seaver-Morgan Co., Cleveland, has recently developed and put into successful operation two fully mechanically operated "barring" or ingot turning machines, for eliminating the strenuous hand labor described.

These machines are typically American, being of "steel mill" design, i.e., they are of cast steel construction and extremely rugged. Traveling on an inclined track parallel with the furnaces, and having the same slope as the furnace hearth, they perform all the functions previously done by hand, with greater speed and ease, and in addition eliminate several men from the force required to handle each furnace.

Each machine consists of two carriages. The lower one is a massive one-piece steel casting mounted on four wheels, engaging the main inclined track. These wheels are driven in pairs by two motors. On the upper surface of the lower carriage is carried a section of circular track, the radius point being located at the center of the furnace wall. The upper carriage travels on this curved track and carries a long wedge-shaped bar which can be moved in and out of the furnace. Swinging about the radius point, the bar can be rocked vertically and also turned about a horizontal axis. Each motion has its independent motor, all under direct control of the operator, who is located at the rear and to one side of the center of the upper carriage.

Location of the pivot point of the bar, when swinging in a horizontal plane, is such that extreme angularity may be obtained, regardless of its position in relation to the furnace. To facilitate changing bars, a quickly detachable connection is provided between the bar and its supporting spindle.

Three of the larger ingots may be straightened on the hearth or rolled down its inclined surface at one time by each machine. In case ingots become partially welded together, they may be "sliced" or separated by the bar, due to its shape.

Most of the drives are of the worm type. The worm reductions, as well as all spur gear reductions, operate in oil baths contained in cast steel housings. Due to governing clearances, these machines are compact, yet all parts are readily accessible for inspection or repair. The salient features of construction are protected by pending United States patents.

Welsh Tin Plate Industry to Adopt American Methods

As a result of a recent decision made by Welsh steel and tin plate manufacturers to meet foreign competition in the tin plate trade, engineering work on a large scale is expected in South Wales centers. The introduction of steel strip mills in America has revolutionized the tin plate industry, reducing costs about 2s. (48c.) per standard box. Steel strip 1/16 in. thick, at a cost of little over that for bars, cuts out most of the work in preparing the steel for conversion into tin plate, and Welsh makers fully appreciate the fact that they must adopt the new methods or be driven out of world markets.

It is understood that an outlay of $5,000,000 or more in new plant at the steel works will be involved, and as the majority of the independent steel and tin plate firms cannot face such an outlay, an influential committee has been appointed to see what can be done to meet the need by combination.

The Llanelly Steel Co. is laying down six new sheet mills and a new bar mill alongside its existing works, on the latest American principles. These mills are designed for a continuous process, to yield high output and cheapen production costs.

Wire netting and woven wire, including chain link fencing, are included in a list of goods affected by a recent first order-in-council of the United Kingdom requiring a mark of origin under the Merchandise Marks act, 1926, according to the London Board of Trade Journal, says a statement issued by the Department of Commerce, Washington.

SHEET PACK OPENER

Ten-Sheet Packs Up to 148 In. in Length and 48 In. or More in Width Opened Rapidly

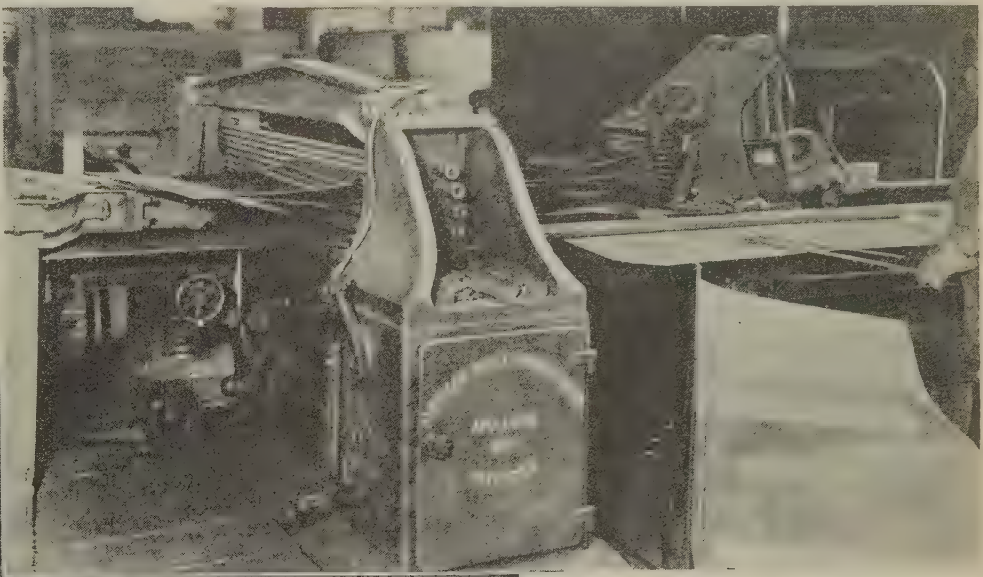
VISITORS to the sheet mills at the Campbell works of the Youngstown Sheet & Tube Co. have been interested in a mechanical sheet pack opener which is in operation there. Results so far attained indicate that another step has been made in the reduction of manual labor in sheet mill operation. This opener was developed and patented by the American Sheet Opener Corporation, Apollo, Pa., and is being built and marketed by the United Engineering & Foundry Co., Pittsburgh. Another machine of this design has been in use for two years at the plant of the Apollo Steel Co., Apollo, Pa.

Two major units of the machine are a set of horizontal rods arranged one above the other and a traveling motor-driven gripper head into which the sheets are introduced between the rods. The rods serve as the separating agency with the backward movement of the gripper head. A pair of pinch rolls carry the packs from a storage platform to a man who inserts the slightly opened sheets through the rods to the gripper head.

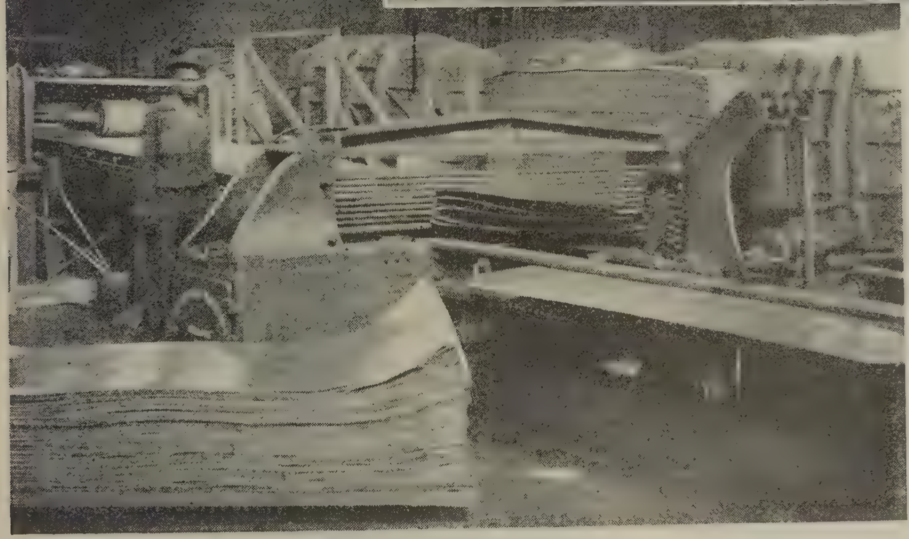
The machine calls for a crew of three men, one to operate it, one on the storage platform and the third to pile the opened sheets as they come through the separating rods. A crew of five men, consisting of the operator, two men on the storage platform and two for piling the separated sheets, has been used. The two extra men meant a smoother operation as the sheet packs are slightly opened by the platform men before they are passed to the operator and the movement to the operator was more constant than it would have been with one man serving. With two men handling the opened sheets, more even piling was possible than if one man was doing the work.

In ordinary sheet mill practice one shear serves two mills and at each shear there is one pack opener. In a 12-mill plant there would be six openers, or 18 for a three-turn day. This mechanical opener will handle the output of 12 mills or six shears and on a basis of three men to the crew or nine for a three-turn day it is pointed out that the labor item is exactly halved. The use of the machine means that instead of opening and piling the sheared packs at the shears, they will be taken after shearing and stacked on the platform of the opener. The mechanical method of opening is rapid.

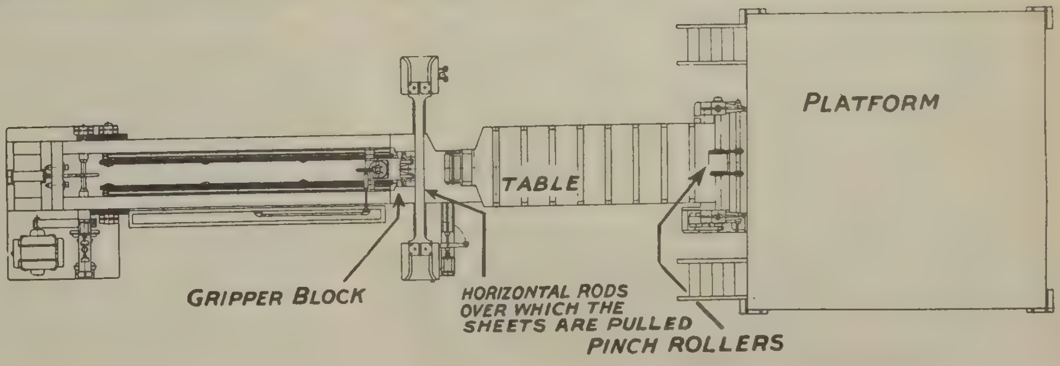
From a pile of sheared sheet packs, the platform man takes a pack and slightly opens it on one end. He then feeds it to the pinch rolls which deliver it to the



BACKWARD Movement of the Gripper Block Pulls the Sheets Over the Rods and Separates Them



FROM the Platform, the Slightly Opened Pack Goes Through the Pinch Rollers to the Machine Operator, Who Enters the Ends of the Sheets Through the Rods. A sweeper arm then pushes the sheets into the openings in the gripper blocks. The ends of the sheets are clamped before the backward traverse of the gripping head

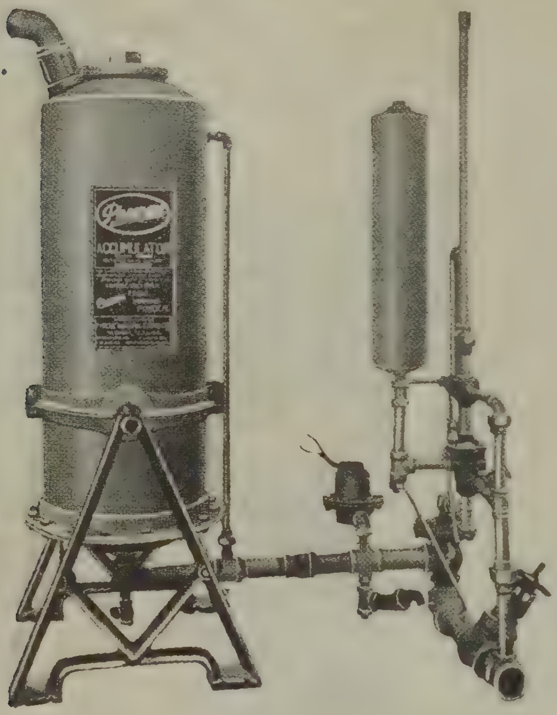


THE Arrangement of the Various Elements of the Mechanical Opener May Be Noted from Plan View at the Right machine operator, who inserts a spacing fork between the open sheets and enters them through the rods. An air-operated sweeper arm pushes the sheets into the openings in the gripper blocks. The ends of the sheets then are clamped in the block, a backward movement of which pulls the sheets over the rods and separates them.

The gripper head and the pinch rolls are motor-operated, while the grippers and the cylinders operating the sweeper arm are actuated by compressed air.

Foam Protection for Flammable Liquid Hazards Is Demonstrated

A demonstration of the Phomene accumulator system for protection of flammable liquid hazards was given jointly by the Globe Automatic Sprinkler Co., Philadelphia, and the Pyrene Mfg. Co., Newark, N. J., at the latter's plant, 109 Meeker Avenue, Newark, on Jan. 19. A feature of the exhibition was the extinguishing of oil fire in a 30-ft. tank section by means of the new foam extinguisher system. Protection of flammable liquid hazard from external ignition and the automatic quenching of fires in a spray booth and a dip tank were also demonstrated.



The Large Tank on the Left Is Capable of Producing 2400 *Gal. of Foam*

The Phomene accumulator system, shown in the accompanying illustration, is 5 ft. 3 in. high and has a base area, including the automatic valve, of 9 sq. ft. The large tank is filled with a charge of 280 lb. of Phomene foam-making powder, capable of producing 2400 gal. of foam. When water is admitted through the pipe connecting the tank with the automatic valve, foam is generated in the accumulator and discharged through the outlet at the top of the tank. As was shown in the demonstration this outlet pipe may be extended to any desired length and equipped with any sort of a spraying or discharging system which may be most suitable to the installation.

In case of very dangerous hazards two or more tanks may be used and the discharge pipes or sprays placed in any position desired. The accumulator is so designed that the chemical reactions are 90 per cent complete before the foam mixture is discharged from the tank, thus precluding the possibility of unreacted chemicals being discharged upon the fire.

The automatic valve, designed and manufactured for the unit by the Globe Automatic Sprinkler Co., turns the water on at the first indication of fire at the hazard and also turns it off when the foam discharge has been completed. Just back of the point where the water connection is made in the horizontal pipe, shown in cross section in the illustration, is a balanced diaphragm valve normally held closed by the water pressure in the smaller pipe attached perpendicularly to the main water connection. This smaller pipe may be continued as a ¾-in. line to the hazard, terminating in one or more standard sprinkler heads.

When a fire starts, the rupturing of these heads will allow the pressure in the small pipe to fall. The valve will then open, admitting water to the accumulator and at the same time sounding an alarm bell. The sprinkler line will not discharge water on the hazard, but will drain through a small valve. An electrical thermostatic device may be provided for faster use and where the hazard is exposed to freezing temperatures.

The accumulator will operate properly, it is claimed, on an applied water pressure of 25 lb. per sq. in. or higher, the most desirable pressure being 50 to 60 lb. per sq. in. The rate of discharge is about 1000 gal. per min., but may be varied by regulation of the water pressure.

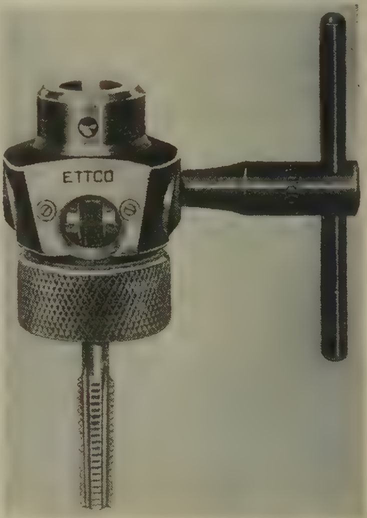
Tap Holding Chuck

The Eastern Tube & Tool Co., 594 Johnson Avenue, Brooklyn, N. Y., is adding to its line the tap-holding chuck here shown, one feature of which is the arrangement whereby the operator can see the two floating jaws gripping the square on the shank.

The square of the tap is held by the two floating jaws which are tightened with a key and the grip is said to be positive. The jaws operate by means of a right- and left-hand thread and are free to float transversely, as their only function is to grip the square and prevent the tap from rotating. The tap is centered by three jaws inclosed in the knurled collar. The two gripping jaws for the square of the tap are of alloy tool steel, heat-treated and ground to an accurate fit in the body. The lower centering jaws are also of alloy steel, heat-treated and ground.

Three sizes of the tap chuck are manufactured. The smallest, the No. 1, is for round shanks up to ¼ in. and taps ⅜ in.; the No. 2 size is for round shanks ⅜ in., and taps, ½ in.; and the No. 3 size has capacity for round shanks ½ in. and taps ⅝ in. Two larger sizes are being designed. The chucks can be furnished with backs threaded, tapered backs or with Morse taper shanks. Provision is made for pinning the threaded shanks securely in place. The chucks are also manufactured with the back extended 1 in. to permit use in tap holders of screw machines. The tap chuck fits directly into the tap holder and is held by a set screw.

Drills, Reamers and Other Tools Can Be Used in the Chuck by Grinding a Flat on the Shank

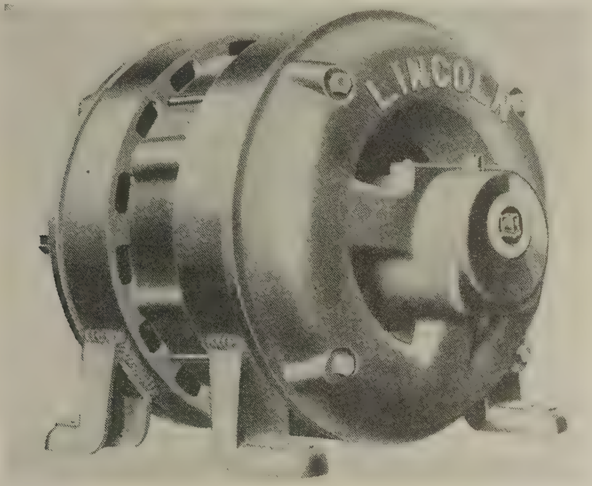


In using the chuck, the tap or other tool is inserted and then centered by turning the knurled collar. The floating gripping jaws are then tightened on the square of the tap by means of the key.

Motor Designed to Start Directly Across the Line

The Lincoln Electric Co., Cleveland, is marketing a new motor, named the Switch Start, which is available in sizes from ½ to 30 hp. and for two or three phase, 60 cycles.

This motor is designed so that it can be started directly across the line without the use of a starting compensator, starting resistance or other voltage-reducing device, with starting current below the requirements of the National Electric Light Association. It is stated that operating characteristics, such as power factor, efficiency, maximum torque, temperature rise, etc., have not been sacrificed in order to secure low starting currents. Tests are said to show that starting torques from full load to better than 250 per cent of full load, depending on the horsepower and speed, are possible without exceeding the N. E. L. A. requirements as to starting currents.



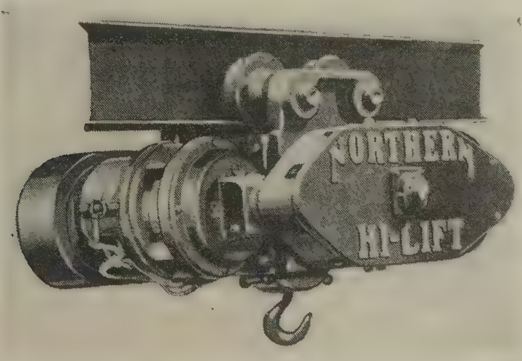
The Motor Is Available in Sizes from ½ to 30 Hp.

Comparison of the speed torque curves of the new motors with the ordinary self-start motors is said to show that the former has equal or slightly higher torque at zero speed. The curve of the Switch Start motor then shows a gradually increasing torque up to the maximum torque point, which is desirable for starting many types of machinery. High pull-out torque, which is of importance in that the motor will not stall on sudden high overloads, is also claimed. Comparatively low temperature rise under continuous full load is attributed not only to the electrical design but also to the welded steel construction which permits greater circulation of air. The motor is normally equipped with sleeve bearings, but ball bearings can be furnished. Larger shafts, larger bearings and waterproofing insulation are also claimed for these motors.

Compact Electric Hoist With High Hook Lift

Compactness and accessibility, as well as rigidity and high hook left, are features of a new series of Hi-Lift hoists being marketed by the Northern Engineering Works, Detroit. One and two motor designs are available.

The hoists are mounted on a plain I-beam trolley and have current collectors. They are provided with two brakes, a motor check brake attached to the end of the hoist motor armature shaft, and a mechanical load brake in the hoisting gear train. This brake, of positive friction disk ratchet type, is similar to that on other of the company's hoists. A feature is the one-piece unit casting now used for the gear train and motor support, the sides of which being cast integrally, assure permanent alinement. This casting is arranged so that the shroud fits over the ends of the drum, which eliminates the possibility of the hoisting rope creeping over the ends of the drum. The hoist is suspended by a substantial cast steel hanger piece. The motor and gear train are connected by a flexible coupling, which compensates for any slight misalinement.

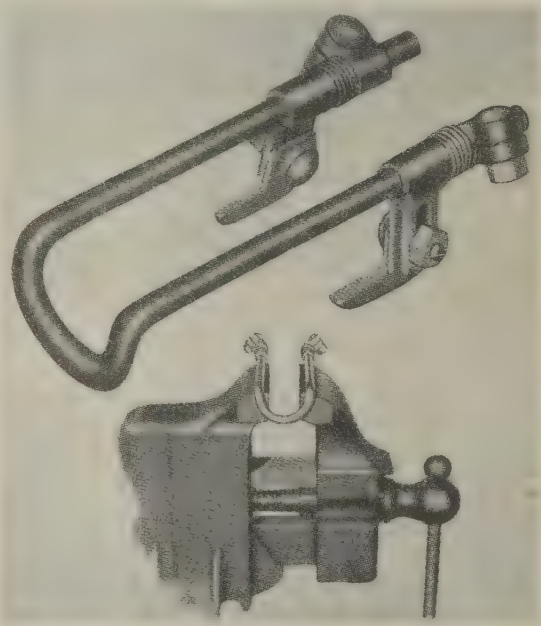


The Load Hook May Be 14 In. from Under Side of Beam to Center of Hook

The load hook is capable of being pulled up within 14 in. from the under side of the beam to the center of the hook. Two stops are provided, one to prevent the load hook from going up too high, and the other to prevent it from completely unwinding the rope and starting it up on the wrong side of the drum. Gear covers are split horizontally and can be removed conveniently for inspection or removal of the gearing, without disturbing the other parts. Another feature is the method of attaching the rope to the drum whereby the cable with the end thimbles can be installed conveniently. The lower limit stop includes a spring-actuated tripper which springs out after the last layer of rope is off the drum. This makes contact with the levers for the upper limit stop, controlling the downward movement of the load block.

Work Support for Use in Vises

A work support for use on any standard vise and intended to increase the holding power, particularly on work of eccentric shape or stock with very little gripping surface, is being marketed by A. F. K. Fountain Works, Milwaukee.



The Holding Power, Especially on Stock of Irregular Shape, Is Increased

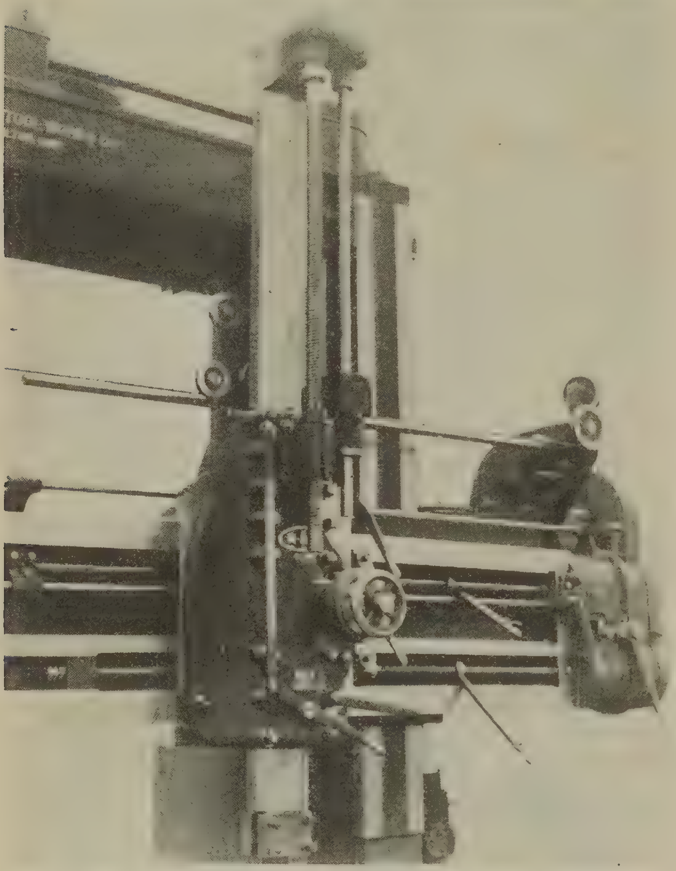
The arrangement of the device, which may be conveniently attached and removed from the vise, may be noted from the accompanying illustrations. The supporting yoke is of nickel steel, case hardened to prevent distortion. The corrugated adjustable clamps are malleable iron castings and are held by 5/16-in. bolts. The torsion springs are of piano wire. It is claimed that thin brass tubing can be held firmly without slipping, crushing or marring. The support shown is for stock of from ¼ to 2 in. in diameter, although supports for larger stock can be furnished.

The thirteenth international convention and Inform-A-Show of the National Association of Purchasing Agents will be held at Kansas City, Mo., May 28-31. Headquarters of the association are at 11 Park Place, New York.

12-Ft. Boring and Turning Mill with Thread-Chasing Attachment

Equipment of the right-hand head with a thread-chasing attachment is a major new feature of the 12-ft. boring and turning mill illustrated which has been brought out by the Niles Tool Works Co., division of the Niles-Bement-Pond Co., Hamilton, Ohio. In general design the machine follows the new 18-in. and 20-in. boring and turning mills described recently in THE IRON AGE. The thread-chasing attachment is of the lead-screw type and gives leads up to 2 in.

Features in common with the larger mills include double table tracks, with pressure lubrication; sliding gear feed boxes, with gears running in oil; and forged steel bars. The crossrail is of square box section with bearing on the face of the housings and extending back between the housings. There are separate motors at the back of the rail for rapid traverse of the bars and saddles; direct-reading micrometer dials for saddle and bar movements; limit switch for elevation of crossrail; entirely inclosed drive box with all steel gears and pressure lubrication; steel table gear; and inclosed rail elevating gears on the top brace.



The Thread-Chasing Attachment Is On the Right-Hand Head and Is of Lead Screw Type

The machine is driven by a 35-hp., direct current, 4 to 1 variable speed motor, giving table speeds ranging from 0.56 to 10.8 r.p.m. A 7½-hp. motor is employed for the crossrail and two 5-hp. motors, one for each head, for rapid traverse of saddles and bars. A ½-hp. motor drives the oil pump.

Feed and traverse movements of bars and saddles are obtained through large friction clutches housed at the end of the rail, but for the chasing mechanism positive motion is provided through an additional train of shafts and gears. Threads are engaged by half nuts closed by a lever at the base of the saddle. A handwheel on the saddle releases the bar rack pinion when the chasing attachment is in use. Three leads are furnished, but these may be varied by means of additional gear ratios.

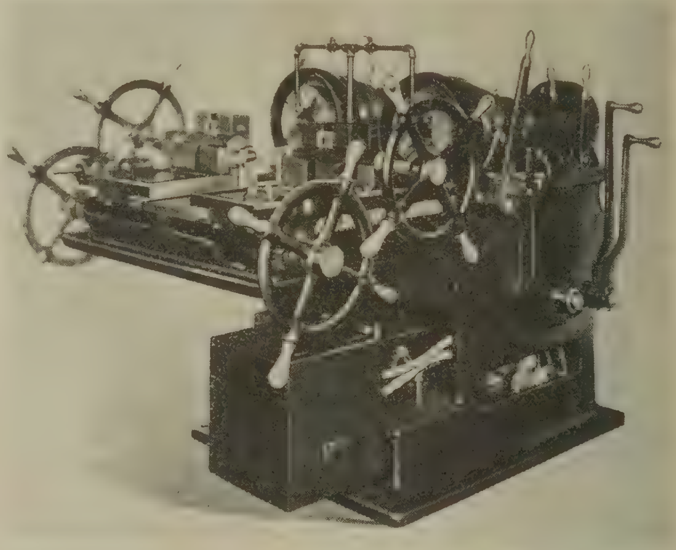
Bituminous coal mined in the second week in January is reported by the United States Bureau of Mines at 10,871,000 net tons. This is a gain of more than 10 per cent over the preceding week, but lacks 20 per cent of the large output of the corresponding week a year ago.

Double-Head Bolt Threader With Eight Speeds for Each Head

The Williams Tool Corporation, Erie, Pa., is bringing out the double geared-head bolt threading machine illustrated, which is provided with eight spindle speeds for each head and is arranged for complete control from either side of the machine.

Features of the company's Rapiduction single-head bolt threader, previously described in THE IRON AGE, are incorporated but the double-head unit is intended for a wider range of threading production. Two sizes of the machine are available, the smaller being for cutting ⅜-in. to 1½-in. threads and the larger for threads ranging from ½ in. to 2 in. inclusive. In cutting long threads two set-ups may be handled at the same time, and another source of saving claimed is in set-up time when two different sizes are being run through together with frequent change from one size to the other. Production is facilitated by having complete control from either side, and the convenient selection of any one of eight spindle speeds is pointed out as permitting maximum production on each size of bolt being threaded. The driving motor is mounted in the base of the machine and is entirely inclosed to prevent damage from chips and dirt. It is provided with an adjustable base to permit keeping the driving chain tight at all times. All driving gears are of hardened steel, and run in a bath of oil. Die heads are lubricated by means of a chain-driven pump mounted in the base of the machine, beside the motor. The oil from the die head is returned through a strainer to the pump and used over again.

Simplicity of the automatic die heads is another feature emphasized. Automatic compression springs open and close the dies and the heads are adjusted to the size bolt to be cut by pulling the control lever forward. An automatic trip lever gives the operator instant control, a light push automatically disengaging the die head without necessitating shutting down the machine. The trip rods on the carriages disengage the die head automatically after each threading job. By loosening the locking screw the dies for either head can be removed and changed in a few seconds, without removing the large die holders. If one die is snipped it can be replaced without removing any other die from either head.



Complete Control from Either Side Is Provided. The driving motor is inclosed in the base

---

The mid-winter meeting of the Eastern States Blast Furnace and Coke Oven Association is to be held Friday, Feb. 17, at the William Penn Hotel, Pittsburgh. In the morning there will be separate round table discussions of blast furnace and of coke oven topics, while the afternoon session will be devoted to topics of joint interest to blast furnace and coke oven operating men.

A. E. Kelly, New York district representative of the Donner Steel Co., Buffalo, in the sale of pig iron, will move his office on Feb. 1 from 2 Broadway to 39 Cortlandt Street.

Business Analysis and Forecast

BY DR. LEWIS H. HANEY
DIRECTOR, NEW YORK UNIVERSITY BUREAU OF BUSINESS RESEARCH

GENERAL BUSINESS OUTLOOK

Favorable Factors

1. The P-V line continues to rise.
2. Unfilled orders increased more than usual in December.
3. Commodity prices average firm to rising; pig iron markets stronger.
4. The farm situation is favorable.
5. Retail trade gained in December and was above normal.
6. Building activity is well maintained.
7. Money is still easy; Federal Reserve ratio recovers.
8. Continued caution in business.
9. Continued strong financial position of most leading companies.

Unfavorable Factors

1. Bank credit is over-extended in the direction of the security markets; brokers' loans large.
2. A rising trend in money rates is seen in the recent advances in time loan and bank acceptance rates.
3. Considerable unemployment exists and reduced purchasing power of factory laborers.
4. Small business profits.
5. Decline in December exports.
6. Large manufacturers' physical inventories, on the average.
7. Disturbed political conditions.

SUCH favorable factors as those above are the more fundamental as affecting industry and business. The more "barometric" indications promise business expansion during the first half of the year, but some financial readjustments will probably be required and may occasion irregularity.

Ingot Output Responds to P-V Line

STEEL production has gained, following by about seven months a rise in the P-V line. This is a rather slow response, but about the same period of time elapsed between the upturn of the P-V line in 1921 and the beginning of expansion in steel production in August of that year.

The rise in the P-V line means that the supply of commodities has been so reduced in comparison with the demand that markets are, on the average, stronger. The measurements used for determining the relative position of demand and supply are broad and general and apply necessarily only to the average condition. But we have supposed that the iron and steel industry is so broadly related to industry in general that the indications of the P-V index would apply to it. Experience thus far has justified this supposition.

At present, for example, a long period of curtailment in the railroad equipment industry and in automobile manufacturing has so reduced supplies that the technical position of the markets for these commodities is stronger. Temporarily, at least, the demand has increased and is stronger relatively to supply. Surpluses have been reduced. Current additions to supply are small. Buyers have waited and have used up or have allowed to become obsolete the units they are now operating. The situation is thus stronger. These two items of manufactured products are largely made of steel and the steel makers benefit by the situation.

Much the same may be said of hundreds of manufactured articles. Even building operations in many lines have been sufficiently readjusted, and for a long enough period to suggest that at least a normal volume is to be expected.

Less Active Demand in Later Months

As to the more distant future, it will be noted that the P-V line is "tapering off." In the course of time, as industrial activity expands, supply will gain on demand and the intensity of demand will ultimately decline. Judging by the past, there will eventually come another period of curtailment. Steel makers, like other producers, will some time find themselves turning out more products than buyers will take at profitable prices. This condition will probably be anticipated several months in advance by the P-V line. As yet, the trend

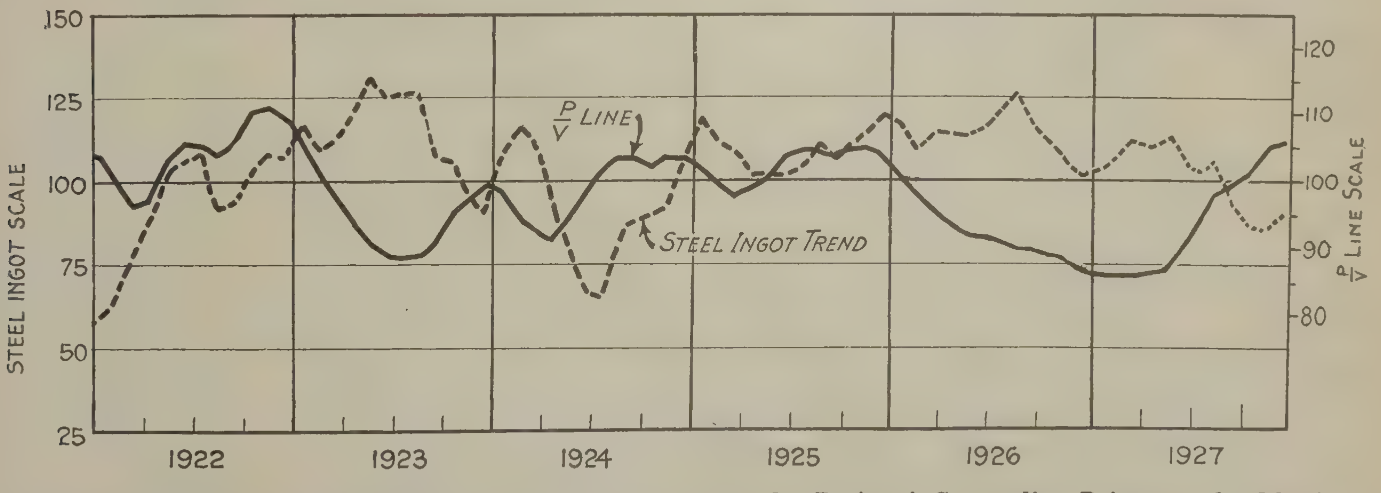


Fig. 1—Upward Movement of the P-V Line (Representing the Ratio of Commodity Prices to the Physical Volume of Trade) Has Continued for Eight Months. Steel production has responded sluggishly and good tonnages, with better prices, may be expected for some time

of that line is upward and seems likely to continue so for another month or two.

Even when it begins to decline there will be a period of several months before the results are apparent in business. The point is that *the basis seems to have been established for at least six months of expanding steel production.* We would guess that the industry might go ahead until August, at least. But much depends on the moderation of operations: The slower the steel makers are to expand operations in excess of the current requirements of steel consumers, the longer the rising trend—also the more satisfactory the market prices.

Aside from the inevitable hazards of foreign complications and domestic political developments, the chief uncertainty in all this reasoning lies in the financial situation. Any great tightening in bank credit, attended by a serious decline in security markets, would naturally react unfavorably on business. At present there are some indications that bank credit is tightening. Time loans have risen and the bank acceptance rate has been marked up one-eighth. The Federal Reserve banks have sold a considerable quantity of Government securities, which tends to bring firmer money markets. For some months the Federal Reserve ratio has shown a declining trend.

Incidentally, the security markets have been hesitant of late, if not slightly reactionary. But we are impressed with the localized character of the financial trouble. The inflation has been confined to the security markets and credit is not really tight. There is no indication that any drastic curtailment of bank credit will be required to check speculative excesses. In short, while firmer money is probable, the present outlook is for no such advances in money rates as would operate as a check on business.

Not until business expands sufficiently (1) to bring its requirements up to a point where funds will become scarce and (2) to bring production to a point where there are prospects of over-supply markets and declining dividends, are we likely to see any prolonged major financial recession. At present no such expansion exists and credit strain is potential and prospective rather than actual. It is possible that business expansion may proceed without much retardation from the financial situation.

Buoyant Indications of Several Elements

EVERYTHING in the second chart points upward. In the first place, and most important, the unfilled orders barometer (which is the rate of change in the monthly unfilled orders of the Steel Corporation), has risen sharply. Being above the base line, this means an actual increase. The sharpness of the increase is obvious and is the more noteworthy in that the usual percentage of gain for December is not counted. The gain, allowing for seasonal variation, is the sharpest since that which occurred in November, 1924. It contrasts with a decline in December, 1925, and again in December, 1926.

Such gains in unfilled orders, both logically and in fact, have usually accompanied rising prices for steel. The suggested rule appears to be without exception, when the trend of unfilled orders is backed up by a corresponding trend in scrap prices. Heavy melting steel scrap at Pittsburgh averaged $15 a ton in December, against $14.19 in November, and got as high as $15.50 toward the end of the month. This would seem to be a confirmatory trend. Thus far in January, however, scrap prices have weakened somewhat and at present are back to $15. The relapse is due probably to speculative conditions. The expansion in steel production and the firmer tone in pig iron markets seem to indicate that, in spite of some irregularity, scrap prices will move up during the next few months. If this conclusion proves accurate, we have advances assured in both scrap and unfilled orders, and indications of further improvement to come in the steel industry are strong.

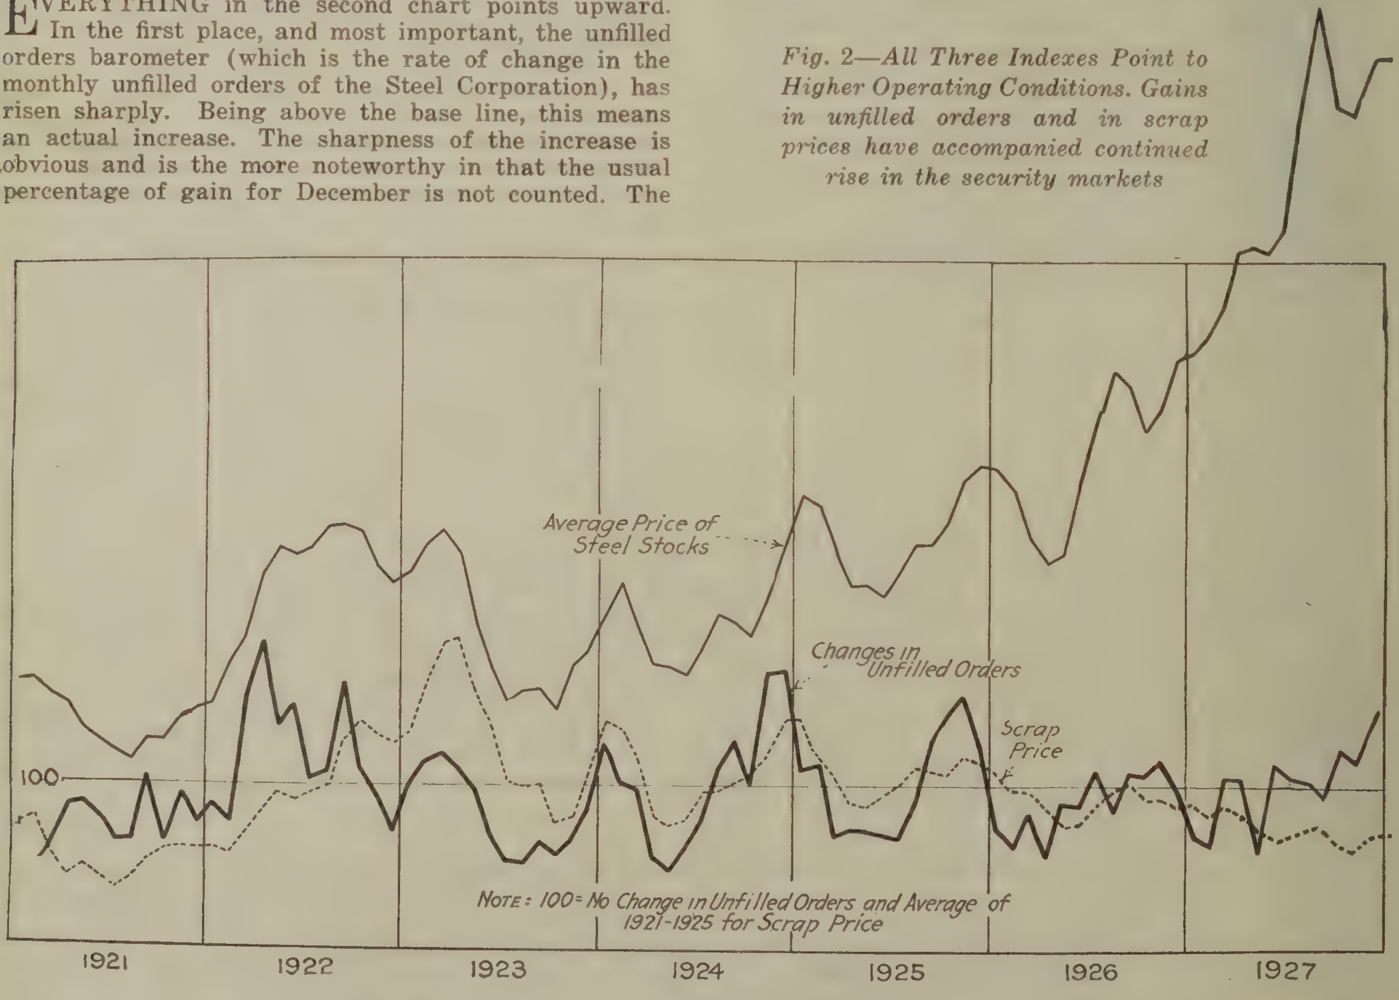
The action of a representative group of steel stocks has been influenced by the general speculative situation. The stock market has been adjusting itself to the uncertainties of the credit situation and steel stocks have moved in sympathy. Judging by the foregoing barometers, the sounder steel issues are likely to do somewhat better than the average of other stocks, and to show strength, pending more decidedly unfavorable developments in the money market.

Retail Trade Outstripping Wholesale

FURTHER grounds for assurance as to business are seen in the third chart, which shows the relative positions of industrial production, wholesale trade and retail trade. The most favorable item is found in retail trade, which made a good recovery in December. It increased much more than usual for the season and, except for the August peak, is at the high point of recent years. This increase in retail sales is marked in the case of the mail order business, while department store sales have barely held at the normal level.

While retail trade has picked up, the trend of industrial production continued downward through December. This is particularly true of *quantity* of production. When current prices are applied to the quan-

Fig. 2—All Three Indexes Point to Higher Operating Conditions. Gains in unfilled orders and in scrap prices have accompanied continued rise in the security markets



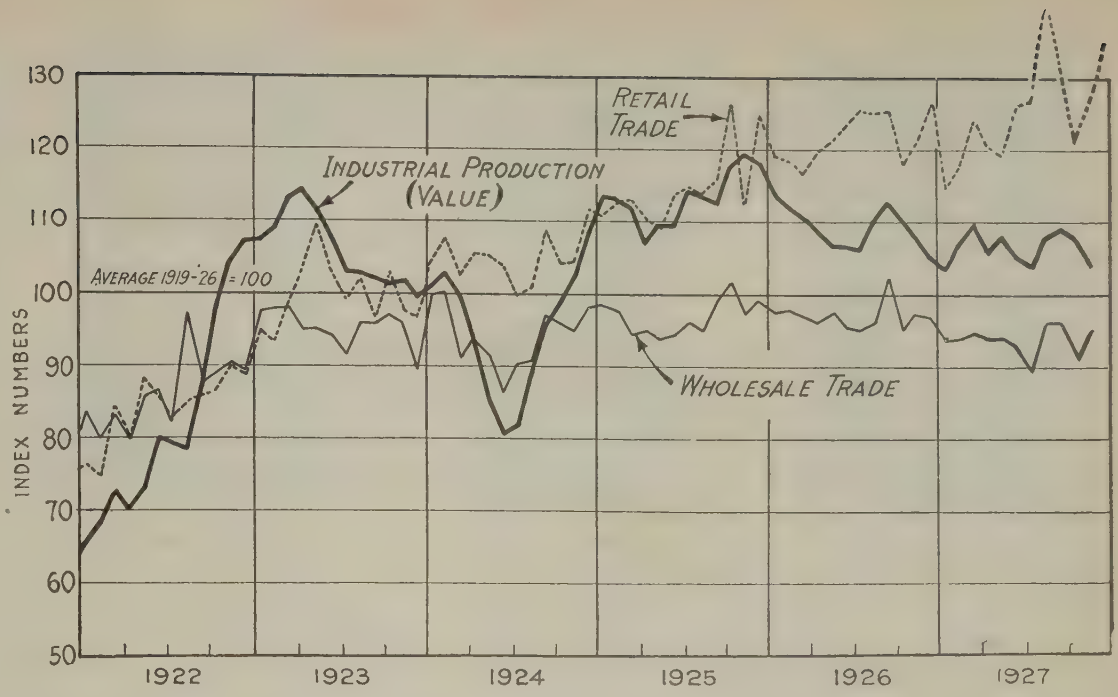


Fig. 3—Favorable Indications Are Seen from the Relations of Retail Trade, Wholesale Trade and Industrial Output. Retail trade has gained more largely than usual. Wholesale business continues slow, while industrial production is a little above normal

tity of industrial materials produced, we find that the curve of industrial production *value* is moving irregularly and that the trend during the past year has been rather "sidewise." This in itself suggests that production is not badly out of line with demand, since the markets for industrial products are strong enough to allow prices to be maintained. Moreover, the production value curve is so much below the retail sales curve that its position in this respect tends to support the foregoing suggestion.

Wholesale sales, however, are relatively low, in spite of the gain which occurred in November.

Employment in Ohio Showed Little Change in December

December employment reports from 64 Ohio foundries and machine shops disclosed practically no change from November, although there was a decline of 14 per cent from December, 1926. Increases in Cincinnati, Cleveland and Columbus were offset by decreases at Dayton and Toledo, while Cincinnati was the only city showing an improvement over December, 1926. Twelve Ohio steel works and rolling mills showed a continuation of the decline which started in June, employment being 4 per cent less than in the corresponding month of 1926 and 20 per cent less than in May, the peak month of 1927. Among automobile and automobile parts manufacturers there was an improvement in employment in December for the first time since May, 1927. The betterment amounted to 28 per cent compared with November, but showed a loss of 11 per cent from December, 1926. The reports are received monthly by the Bureau of Business Research of Ohio State University for publication in its bulletin.

Protest Tin Plate Freight Rate Between California Cities

WASHINGTON, Jan. 24.—A protest has been filed with the Interstate Commerce Commission by the California Transportation Co. and the Sacramento Navigation Co. against a suspended rate of 9c. per 100 lb. on tin plate, in minimum carloads of 80,000 lb., to Sacramento from San Francisco and Oakland, Cal., and certain intermediate points. The rate of 9c., suspended until May 10, was proposed by the Western Pacific Railroad. The existing rate from San Francisco is 18.5c., 36,000-lb. minimum. The protestants state that the Western Pacific Railroad staked its case on the "asserted belief that the United States Steel Products Co. would inaugurate its own barge service unless it reduced the rate." It is contended by the protestants that the type of steel barges owned by the Steel Products Company is not adapted to navigation on the Sacramento River and that that company could not possibly save over $1,250 per year if it established the service.

Blaw-Knox Co. Merges with Andrews-Bradshaw Co.

The Blaw-Knox Co., Pittsburgh, manufacturer of steel and iron products, buckets, machinery, etc., has concluded arrangements for a merger with the Andrews-Bradshaw Co., 530 Fourth Street, Pittsburgh, manufacturer of steam purifiers and other steam specialties. The latter company will retain its identity and will operate as a division of the Blaw-Knox Co. Grant D. Bradshaw will remain as president; L. F. Kuhman, vice-president, and R. W. Andrews, secretary and treasurer. Production will be carried out at the Blaw-Knox plant.

Timken Roller Bearing Co. to Spend $4,000,000 for Expansion

The Timken Roller Bearing Co., Canton, Ohio, has authorized an expenditure of $4,000,000 to be devoted to increasing the production facilities. The greater part of this expansion program concerns the company's plant at Canton, where both the steel mill and the bearing manufacturing plant will be considerably enlarged. Among other features a new substation of greater kilowatt capacity will be built for supplying electric power for both the steel mill and the factory. The contracts for steel construction alone amount to $300,000 or more.

Schedule of the next installments of the ***Business Analysis and Forecast****, by Dr. Lewis H. Haney, Director New York University Bureau of Business Research, follows:* ***Feb. 16****—Activity in Steel Consuming Industries;* ***Feb. 23****—Position of Iron and Steel Producers;* ***March 1****—General Business Outlook.*

Sound Competition Is Prime Need

Continuance of Prosperity Demands Elimination of "Deficiteer" —Trade Association Activity Salutary

BY MAGNUS W. ALEXANDER*

IS LARGE business volume a safe criterion of business prosperity and is growing business competition a conclusive proof of decline in our prosperity?

The foundation of business prosperity is competition. It is important, however, that it be the right kind of competition. If constructive, it will stimulate trade and bring into play the best human faculties and the highest technical and economic intelligence; if destructive, it will undermine business, cause unethical methods to be used and breed economic ill-health.

Competition today is making itself felt to such a degree that, while activity is reaching steadily higher levels, many branches of industry are complaining that theirs is a "profitless prosperity." The fact is that in recent years about two in every five manufacturing corporations have either made no profits or have incurred a deficit. Analysis by the research staff of the National Industrial Conference Board of income tax returns to the Federal Government shows that in 1920, 37 per cent; in 1921, 54 per cent; in 1922, 41 per cent; in 1923, 37 per cent; in 1924, again 41 per cent, and in 1925, 39 per cent of all manufacturing corporations reported no net income. During these six years, for every $100 earned by successful concerns, $32 was lost by the unsuccessful corporations.

The board's analysis further shows that manufacturing corporations in 1925 not only operated on a distinctly narrower profit margin per dollar of sales than in 1923, the last previous "good" year, but that the average net income of 99.89 per cent of them—that is, all those with less than $5,000,000 net income in the year 1925—was nearly 11 per cent smaller than in 1923.

The reports of earnings during the second quarter of 1927 of several hundred corporations are now available. An examination of these shows that a few outstanding organizations are doing better, but by far the majority show a profit rate that is below what they were earning in the same period during 1926.

In certain lines, goods have actually been placed on the market at below production costs. This naturally stimulates a far-reaching question: Is it economically sound or socially desirable that over a consecutive period of time goods be sold without profit or at a loss? And this leads to a further observation of some interest. During the world war the word "profiteer" was coined. Has not the time come when in the same way we should hold up to scorn the "deficiteer," the man or organization who, either counting upon ability to withstand losses longer than some competitors or in ignorant or willful disregard of consequences, sells at a price below what the commodity is fairly worth or even below production cost?

Many trade groups, awakening to the seriousness of the situation as it has confronted them in their particular industrial branches, have been attempting through education in cost accounting to teach producers how to fix fair selling prices. Others, through the establishment of business standards and codes of ethics, are aiming to develop a moral plane of fair dealing that will put a stigma upon the individual or organization that indulges in unfair trade practices. Business men themselves have been urging the wisdom of restraint so as to assure a sustained period of moderate prosperity in preference to brief periods of boom prosperity with their inevitable grief. It is significant indeed that within the last year the chairman of the Federal Trade Commission has appealed for authority to add to the commission's powers by permitting it to prevent uneconomic, as distinguished from illicit, practices. Certainly, the experience of the petroleum industry and of the coal industry in the last few years has emphasized that we are reaching a stage when collective action may be required to safeguard basic industries from disorganization and possible disaster following upon the shortsighted policy of a few producers. While competition is the life of trade, it should be economically and socially fair, and should not be tainted by the leprosy of the profiteer or of the deficiteer.

I think it to be true that, while the competitive struggle has been increasing, the standards of business dealing have also steadily been elevated. Am I not right in claiming that it would be considered unethical today to do things which a generation ago would have been justified as measures of self-defense in business—such as "knocking your competitor's product," or "shading" in a secret transaction the established price to a few of one's customers, or "spying" on a competitor's salesmen, or "enticing away" customers unfairly?

I think the influence of the trade association movement in setting and maintaining those higher standards of business conduct generally, which have heretofore had to depend more on the personal honor of a few and the influence exerted by them, has been the most potent single factor in this transformation. Many of the trade associations have not only given clear definition to the guiding principles of business morality, but they have brought the steady pressure of group opinion to bear upon their enforcement. They have cleared the field for the rational determination of business policies, without enjoining the sacrifice of independence. They have done this especially by assembling reliable, trade-wide statistics upon all aspects of current conditions concerning which information is essential to the formulation of sound judgment. They have eliminated ambiguities from trade terminology and standardized collateral features of ordinary commercial transactions.

The immediate outlook is for more, rather than less, business competition. This should not frighten, but should stimulate us. It should make us apply scientific methods and intelligence wherever possible, prevent waste and inefficiency, improve and invent for the more effective satisfaction of the rising demands of the people and for the release of human labor where practicable, and train labor for more skilled tasks, staff personnel for efficiency, and executives for managerial capacity.

If, as claimed, sound competition is the cornerstone of business activity and thus the road to the achievement of a stable and prosperous condition of business, so a prosperity that permeates the country widely fosters and makes possible a healthy and stimulating competition. A high social service is, therefore, being rendered by keeping competition sound and prosperity widely diffused, for in the state of business and of competition are bound up the fortunes and well-being of the people of the United States.

Present conditions contain a challenge, but the challenge is essentially to the business men. Such challenges are not new in our national economic life. We have overcome similar problems before. We ought to be able to overcome them again. If it is true, as some assert, that there is more business genius in the United States than elsewhere in the world, that genius ought to be applied to the betterment of the business organization and to the development of such standards of business conduct as will bring forth the best of which management is capable. It will then be more fully recognized that competition and prosperity in business are compatible factors and not antagonistic forces and that, even under keenly competitive conditions, there can be a substantial business prosperity.

---

*President National Industrial Conference Board, New York. Abstract of address before Michigan Manufacturers' Association, Detroit, Dec. 8, 1927.

R. J. WYSOR

F. E. FIEGER

J. Z. COLLIER

S. S. MARSHALL

New Jones & Laughlin Operating Officials

R. J. WYSOR, since 1925 assistant general manager of the Jones & Laughlin Steel Corporation, Pittsburgh, has been made general manager of all works and properties of the corporation, succeeding T. M. Girdler, the corporation's new president. Mr. Wysor's successor as assistant general manager is Frederick E. Fieger, for the past five years general superintendent of the Aliquippa works, Woodlawn, Pa. J. Z. Collier, who has been general superintendent of the South Side works, Pittsburgh, becomes head of the Aliquippa works, and is succeeded by S. S. Marshall, Jr., who has been assistant general superintendent of the South Side plant. H. D. Stark takes the position vacated by Mr. Marshall.

Mr. Wysor was born in Dublin, Va., in 1885, and received his technical training at Virginia Polytechnic Institute, Blacksburg, Va., from which he was graduated in 1906. For the next four years he was chemist and assistant chief chemist at the Duquesne works, Carnegie Steel Co. Leaving that company in 1910, he was for two years engaged as metallurgist for the Panama Canal Commission and then joined the Bethlehem Steel Co., serving for four years as chief chemist and engineer of tests, for two years as superintendent of blast furnaces and for one year as superintendent of the service department at the Bethlehem works. From 1919 until 1923 he was assistant general manager of the Maryland plant, Sparrows Point, and with the acquisition of the Midvale Steel & Ordnance Co. by the Bethlehem company in 1923, he was transferred to the Cambria works, Johnstown, Pa., as assistant general manager. He joned the Jones & Laughlin corporation in 1925 as assistant general manager.

Mr. Fieger is a native of Pittsburgh and has been with the Jones & Laughlin corporation since 1917. His connection with the steel industry began in 1901, when he went to work in the engineering department of the American Tin Plate Co., which later was merged with the American Sheet Steel Co. into the present American Sheet & Tin Plate Co. He left that company to engage in consulting engineering in Pittsburgh in 1909. In 1913 he joined the Whitaker Glessner Co., Portsmouth, Ohio, as chief engineer, and two years later became general manager of that plant, which is now the Portsmouth works, Wheeling Steel Corporation. He became superintendent of the wire department, Aliquippa works, Jones & Laughlin Steel Corporation, in 1917. A year later he was made superintendent of steel works, in 1920, assistant general superintendent, and in 1923, general superintendent of the Aliquippa works.

Mr. Collier, who was born in Atlanta, Ga., in 1887, was graduated from the Georgia School of Technology in 1906 and in 1907 went to Pittsburgh to enter the employ of the Westinghouse Machine Co. He joined the Jones & Laughlin organization in 1918 as assistant chief engineer at the Aliquippa works and later served as steel works and blooming mill superintendent. He was appointed assistant general superintendent at the South Side works in 1923 and general superintendent on Jan. 1, 1926.

Mr. Marshall's experience has been solely with the Jones & Laughlin corporation, with which he has been identified since 1903, when he went to work in the engineering department of the Eliza Furnaces, Pittsburgh. Later he became superintendent of construction for works on the north side of the Monongahela River and still later, general master mechanic of the Soho department. He was made assistant general superintendent at the North Side works in 1917 and assistant general superintendent of the South Side works in 1925.

George M. Laughlin, Jr., Elected Chairman of Jones & Laughlin

George M. Laughlin, Jr., vice-president Jones & Laughlin Steel Corporation, has been elected chairman of the board to succeed the late B. F. Jones, Jr. Mr. Laughlin, who was born in Pittsburgh, is a son of the late Major George M. Laughlin, one of the early partners in the business, who was actively connected with the organization until his death in 1908. The new chairman attended St. Paul's School, Concord, N. H., and Yale University, joining the steel company in 1893 in the operating division, where he continued in various executive positions until he became a vice-president in 1921. Some years prior he was made a director and member of the executive committee.

To Install Recuperator for Bar-Heating Furnace

A Rust refractory recuperator is to be installed in conjunction with a bar-heating furnace at the plant of the Steel Co. of Canada, Ltd., Hamilton, Ont. The furnace will be provided with a perforated arch through which highly preheated air from the recuperator will enter the combustion chamber, mixing with the coke oven gas which will be used as fuel.

After passing through the furnace, the waste gases travel downward to the recuperator, which is situated beneath the furnace. The gases then pass horizontally through the recuperator waste gas flues and thence to the stack.

Air for combustion enters the recuperator at the bottom and passes vertically upward through the air flues in refractory tile. From the recuperator the preheated air is led upward to the perforated roof and enters the furnace chamber at this point.

Column construction is used in building the recuperator, each tile being ground at the top and bottom to make a positive gravity seal. The work is to be done by the Rust Engineering Co., Pittsburgh.

This Issue in Brief

Greater sales volume at the expense of profits. Though volume output reduces production costs it also tends to lower prices, and prices and profits have declined faster than it has been possible to reduce manufacturing costs. Selling prices are bound to suffer so long as operating heads are permitted to press sales departments for more business as a means to lower costs.—Page 282.

Steel has not lost in competition with cement. Structural steel shipments have increased steadily since 1913. Shipments of 1927 more than doubled those of 14 years ago, while the gain in Portland cement shipments relatively was not so great.—Page 283.

Welsh tin plate industry plans to spend $5,000,000 on modernization. Will adopt American methods, realizing that they must do so or be driven out of world markets.—Page 270.

Old-fashioned beer bottle gives way to stainless steel container. German brewers find that the quality of the beer is not affected by Krupp stainless steel "V2A." Containers are collapsible, occupy less room than bottles, and are more durable.—Page 311.

Praises trade associations for their wholesome influence on business. They have been the most potent single factor in the raising of standards of business conduct, says head of National Industrial Conference Board.—Page 278.

Lower zinc prices due chiefly to increasing application of differential flotation. Shrinkage of one-third of value in less than two years is ascribed to low cost of producing electrolytic zinc from complex ores by the new process.—Page 282.

Labor cost reduced 50 per cent by mechanical sheet pack opener. New machine enables three men to do the work formerly done by six.—Page 271.

Competition and prosperity are compatible. The prospect of greater, rather than less, competition should not frighten, but should stimulate business, says chief of National Industrial Conference Board. But competition must be sound, which demands the elimination of the "deficiteer," he who sells at a price below what the commodity is fairly worth.—Page 278.

Good forgings can be made with a three to one reduction from the ingot. Locomotive builder finds that the five to one reduction, a trade practice of long standing, is not necessary. The use of the smaller ingot reduces the tendency for segregation.—Page 258.

Drastic curtailment of bank credit to check speculative excesses will not be required, economist believes. While firmer money is probable, the present outlook is for no such advance in money rates as would operate as a check on business, says Dr. Haney.—Page 276.

Saves 46 per cent of power cost in rolling mill operation by using anti-friction bearings. Power cost on 16-in. three-high breakdown mill with plain bearings was $8,029 per annum, and $4,335 when roller bearings were used.—Page 260.

Reduces cost of lubricating hot saws by applying anti-friction bearings. Where grease is the lubricant, the ratio is about one to ten in favor of the tapered roller bearing, says bearing manufacturer. Even where oil is used, the improvement is considerable.—Page 262.

Billionth of an inch measured by photoelectric device. New invention registers a change in length of metals, under higher temperature, as small as one-tenth of the diameter of an atom.—Page 263.

Fewer motor vehicles made in 1927 than in any other year since 1922. The total of cars and trucks produced was 3,393,887, which was 21 per cent under 1926.—Page 312.

Enameling costs reduced by use of automatically controlled conveyors. Power conveyors of the roller type carry the ware into the dryers after spraying.—Page 266.

Scrap prices will move up during the next few months, Dr. Haney believes. This is indicated, he says, by expansion in steel production and firmer tone in pig iron markets.—Page 276.

Gain of 2.6 per cent in by-product coke capacity in 1927. The 12,756 ovens now built or under construction have a capacity of 83,826,638 net tons of coal annually, giving an estimated yield of 58,555,726 tons of coke.—Page 268.

Straight anneal of heavy forgings will not produce a desirable grain structure, says locomotive builder. He declares that the terrific strains set up in quenching make it necessary to normalize and anneal.—Page 258.

Finds deep-etch test invaluable in guarding against acceptance of questionable steel. Forging manufacturer believes that this test is the only one which will detect thermal ruptures produced during casting, reheating or blooming mill work.—Page 257.

Competition and Business Volume

THE cure for too much competition is not more competition. However, it is one thing to counsel restraint in competition and another to practice it. Every manufacturer is confronted with the need for business and will not relax his efforts to get it so long as there is danger of losing ground to competitors. Moreover, it is natural for him to feel that he is on the defensive and unable as an individual to change a market situation until others take the initiative.

One result of the keenness of competition has been the reduction of costs through increases in production. To obtain a greater volume of business, installment selling has found wide adoption. Yet even with the aid of mass output, made possible by enabling the public to anticipate its buying power, prices have declined faster than it has been possible to reduce manufacturing costs.

It is beginning to be realized that increased volume of business is not the solution of the manufacturer's difficulties. Other ways of reducing costs are being sought. The present tendency toward consolidations is one manifestation of this effort. More attention is also being given to the possibilities of introducing manufacturing economies without expanding production.

That much can be done in this direction is indicated by the advances made in the technique of tanning leather, the output of which is limited by the available quantity of hides. Even where the supply of raw material is not a factor manufacturers are looking for operating economies that are not dependent on larger production. A leading automobile manufacturer some years ago purchased a site for a body factory, but deferred construction because his existing plant facilities were not fully employed. Finally, he succeeded in rearranging operations so that the body works might be housed in the present plant, thus obviating a heavy investment in new construction.

The automobile industry, which has been conspicuous in developing mass production methods, is well aware that there are definite limits beyond which the volume of business cannot be economically expanded. Although it is increasingly cautious in adding plant capacity, its problem is complicated by a fickle market. The models of a given manufacturer may capture the fancy of buyers one year and prove unpopular the next. As a result, there is an uneven demand on the industry, and companies pressed to fill orders are tempted to make excessive investment in equipment and plant.

The situation in the automotive field is cited to show that there is no simple solution of the problem confronting industry today. The policy of the individual manufacturer from day to day will continue to be dictated by realities, not by mere theories. Much will be gained, however, if he stops seeking volume for volume's sake. So long as operating heads are permitted to press sales departments for more business as a means to lower costs, selling prices are bound to suffer.

Zinc on the Toboggan

METAL producers have been worried over the steady decline in lead and zinc prices going on ever since January, 1926. Some rather heroic measures have been taken by the zinc people, even to the limitation of output by Oklahoma miners, but to little avail. From a high of 9.04c. per lb. for November, 1925, the price of prime Western spelter in New York has declined until during the current week it was quoted below 6c. Here is a shrinkage of one-third in value in a little over two years. When is it going to end?

It appears that, despite the continuous growth in world's consumption of zinc, the world's supply of metal—or of high-grade concentrates ready to be changed quickly into metal—has increased even faster. Most worthy of note, for it indicates the cause of the above situation, is the rapidly spreading application of differential flotation to the treatment of complex ores. The high-grade zinc concentrate so made, excessively fine in particle size, is converted to metal much more easily via the electrolytic tank than via the retort. Furthermore, the flotation concentrates are produced mostly in mountainous regions where fuel is dear but water-power plentiful. Hence the growing output of electrolytic zinc and the stagnant condition of the retort plants.

Thus zinc is going through one of those recurrent periods in industrial history when new discoveries in methods of production make available a larger output than the world needs at the time. New uses to consume the surplus are yet to be discovered. We cannot doubt that this extra zinc will be absorbed and put to useful work, but it will take time. Meanwhile over-production, or the threat of over-capacity, will tend to depress the selling price.

Electrolytic zinc has been likened by some to electrolytic copper, and drawing on such a supposed analogy, predictions have been made that retort zinc will disappear. But the cases are not parallel. Electrolytic copper is needed because the electrical industry, the principal copper buyer, requires great purity in its metal for carrying current and only electrolytic refining can give that great purity. On the other hand, zinc of high purity had to fight for its market. In a copper refinery, impure anodes of Bessemer metal are refined with the consumption of relatively little current. In an electrolytic zinc plant, the roasted ore is leached, the solution purified and the zinc deposited from the electrolyte, but only at the expense of much electric energy. With such handicaps, the amount of electrolytic zinc reaching the market from its first appearance in 1916 has been rather moderate, and only from those places where ample power and suitable ore existed side by side.

Differential flotation upset this balance in 1926 and 1927. There are available in many mining districts great tonnages of complex sulphide ore containing lead, zinc, copper, iron, silver and gold, in all combinations of percentages. Even though the total of the metals contained in such an ore is large, it could not profitably be smelted for any one of them. But now a separation can be made into clean lead, zinc and copper sulphides which can be shipped to separate smelters, and good recoveries are made on all the metal content. Obviously when the mining and concentrating charges are divided among the three metals, and the precious metals credited, the cost per pound of making either the copper, lead or zinc turns out to be less than for pure ores of any of the metals smelted direct in the old way.

Trying times are ahead of the high-grade zinc mines, strange as it may seem, for the commanding position in the market will be taken by what in effect is "by-product zinc." Operators in well established Oklahoma camps can meet and agree to curtail their production, but it would be as hard as stopping a gold rush to get the rejuvenated mines in the Rocky Mountains to forego their long awaited bonanza profits—at least until they have had some years of prosperity and acquire a perspective.

Steel and Cement Consumption

THAT the production of Portland cement has increased much more in the past 15 years than the production of steel is a fact that presumably is generally recognized. Any inference that the gain has been at the expense of steel is erroneous. In a general way it may be said that construction work has come to represent a larger proportion of our total industrial activity than formerly. Since 1913 there has been substantially the same increase in ton-mileage of freight movement as in the total production of steel, but both the quantity of structural steel fabricated and the quantity of Portland cement manufactured have increased in much greater ratio. They have approximately doubled since 1913, while the gains in freight movement and total steel production have been less than 50 per cent. The increase in construction work has swelled the output of structural steel and cement alike.

When cement is thought of as a competitor of steel, fabricated structural steel is particularly in mind. It is acknowledged that the use of other forms of steel is stimulated by the increasing employment of cement. A direct comparison of the consumption of fabricated structural steel and Portland cement is therefore strictly in point and reasonably conclusive. Such a comparison is made below for the 15 years beginning with 1913. The first column of the table shows lettings in net tons of fabricated structural steel through 1923 and the shipments of the fabricating shops in subsequent years, compilation of statistics of shipments having begun only with 1924. The second column shows the shipments, in barrels, of Portland cement. The third column gives for each year the number of barrels of cement per ton of fabricated structural steel. The index for 1913 was 70.3, and none so high was shown afterward except for the off-year 1921, when cement dropped only a trifle while steel dropped a great deal.

	Fabricated Structural Steel Net Tons	Portland Cement Shipments Barrels	Barrels Cement to 1 Ton Steel
1913.......	1,260,000	88,689,377	70.3
1914.......	1,266,000	86,437,956	68.2
1915.......	1,797,600	86,891,681	48.2
1916.......	1,838,160	94,552,296	51.5
1917.......	1,663,200	90,703,474	54.5
1918.......	1,639,680	70,915,508	43.2
1919.......	1,602,720	85,612,899	53.5
1920.......	1,684,800	96,311,719	57.1
1921.......	1,113,000	95,507,147	85.6
1922.......	2,112,960	117,701,216	55.7
1923.......	2,188,800	135,912,118	62.0
1924.......	*2,411,390	146,047,549	60.5
1925.......	*2,796,090	157,295,212	56.2
1926.......	*2,842,920	162,187,090	57.1
1927.......	*2,626,680	170,922,000	65.0

---

*Shipments; figures for previous years are for lettings.

It may be mentioned as a detail that consumption of cement increased slightly more than is indicated by the record of shipments, by reason of increased imports and decreased exports, but the difference is not sufficient to alter the fact that in recent years fabricated structural steel has had a higher ratio to cement than in 1913 and 1914.

The foregoing comparison, while favorable to steel, does not tell the whole story. The use of cement in road building and on the farm has greatly increased, these two classes accounting for nearly, if not quite, one-half the total cement consumption. Cement thus used does not take the place of structural steel, but does stimulate the use of other forms of steel, including in particular reinforcing steel, while it also calls for the construction of much machinery.

Relative Coal and Gas Consumption

REFERENCE was made in THE IRON AGE of Jan. 12 to the almost stationary rate of coal production, the annual gain in the past dozen years having been only about 1 per cent. The smallness of the gain, while the requirements of the country have been increasing greatly, is due, as indicated, to improvements in methods of utilization. It is of interest to measure in a general way the saving in coal that has been made by the use of gas, this being entirely distinct from savings effected by burning coal more advantageously for heating and power purposes.

Approximations can be made sufficiently close to indicate the general relationships between coal and the different forms of gas. The measure is necessarily in British thermal units.

Last year's coal production, bituminous and anthracite in the United States, was approximately 600,000,000 net tons. In round figures about 21,000,000 tons was exported, 5,000,000 tons was used directly in the manufacture of coal gas and about 74,000,000 tons was used in making beehive and by-product coke. This left 500,000,000 tons as used direct for the production of heat, in steam raising, melting, heating buildings, etc. This amount of coal represented approximately 13,000 trillion B.t.u. This figure furnishes a convenient quantitative reference for measuring gas fuels.

Surplus coke oven gas, for use outside the ovens, supplied about 215 trillion B.t.u., and coal, oil and water gas about 150 trillion. Natural gas can be estimated only roughly, as returns are slow on its production; but a fair approximation is 1300 trillion B.t.u. There is a total of 1665 trillion B.t.u., which is about one-eighth as large as the heat involved in the 500,000,000 tons of coal used direct.

For a complete count of our thermal disposition petroleum should also be considered. Its production represents slightly more than one-fifth of the total thermal equivalent of the fuel we get from the ground; but the thermal units directly consumed cannot be estimated closely with data now available, because there are large and varying imports and exports, and some petroleum is used in making the manufactured gas reckoned above. Suffice it to say that the readily produced supplies are expected to diminish in a few years. Afterward at greater expense more can be obtained and the working of oil shales will follow. Then, however, the cost will be much higher and it will be correspondingly more advantageous to push by-product coking much further.

As to progress by replacing beehive coking with by-product coking, that work is nearly completed, for last year less than 15 per cent of the total coke was beehive. The proportions were half and half only about nine years ago, for in 1918 and preceding years beehive largely predominated, while in 1919 and following years by-product has been predominant. The fact remains, however, that by-product coking is still pursued chiefly for the production of coke for metallurgical purposes, gas being a by-product. For producing coke to be used as fuel by-product coking is still in its infancy.

Blast furnace gas has not been considered in this cursory examination of relationships. It is a large item in its particular field. Real technical progress may be made at any time in reducing the amount, for increasing attention is being paid to the point that the blast furnace looks too much like a gas producer.

Blacksmithing Skill Still Essential

RECENT articles in THE IRON AGE on the production of heavy forgings—especially the one by E. J. Edwards in the current issue—emphasize the fact that the fundamental considerations underlying sound forge practice are no different now than they ever have been. First get good sound metal; second, heat and forge it with skill; and third, cool it properly. The prime difference between the modern plants and the primitive smithy is that formerly the blacksmith regulated all these essential steps by relying upon his skill and his knowledge of the traditional lore of the art. Naturally the blacksmith and armorer was then highly respected for his accomplishments and his value to society.

In this day of specialization the functions of the blacksmith have been divided. An illustration can be drawn from the cutlery industry in Sheffield. This whole English industry depends upon the fundamentals listed above, but there the production of fine steel is in the hands of one group, the working of the blades is done by men whose fathers have been smiths for generations back, and the final hardening, grinding and polishing is done by still another group of experts who do nothing else.

Our present articles are interesting in tracing this development further; in showing how the technically educated chemist, metallurgist and mechanical engineer have assumed control of the forging operations, devised tests for sound steel, built correct furnaces, laid down proper heating and cooling programs, installed adequate temperature regulators and powerful machinery for handling and shaping the hot metal. The result is forgings of uniformity and quality unapproached in the olden days of control by tradition.

This does not mean that skill is no longer required. The hammer man, or forgeman, or blacksmith may be told when to withdraw a piece from the furnace by a clock and a pyrometer chart, but he still must know how to handle the piece most effectively, where to direct the blows, how often to turn the piece about, and when to stop the work either when it reaches the desired shape or becomes too cool. The manufacture of hollow forgings on a mandrel, such as pressure vessels, hollow shafts and gun tubes, is a matter of especially high art. This skill, coupled with great muscular strength, is admirable, and makes the word "blacksmith" still a title of honor. It is regrettable that many of these men who know so much about forging are still in the wrought iron era of metallurgy and know so little about the heat treatment and properties of plain carbon steel, to say nothing of the important alloy steels.

For it is this ignorance which has militated against the wider adoption of high-strength heat-treated parts in locomotives. Even though progressive manufacturers are amply competent to produce such parts, the operating officials have not yet been able to insure them against abuse by the railroad engineers, repair men and blacksmiths who handle these machines subsequently. Obviously a heat-treated axle or side rod is a positive menace after having been straightened or heated for any reason by one of these old timers who have neither the equipment nor the knowledge necessary to reheat-treat the part correctly. Equally plain it should be to progressive railroad men that they will be unable to effect important economies so long as they permit this condition of inadequate repair knowledge to persist.

Barbour Stockwell Co. Buys Broadway Iron Foundry

Purchase of the Broadway Iron Foundry Co., Cambridge, Mass., by the Barbour Stockwell Co. of the same city is announced. The Broadway Foundry, established in 1864, was one of the pioneer foundries of Greater Boston. The plant will continue to be operated for the present, with Robert C. Bird as manager. Mr. Bird's father began this business during the Civil War. In 1895 his son, Robert, was made president of the company.

Eventually the plant will be dismantled and the business transferred to the Barbour Stockwell Co. plant. The latter now becomes, it is said, the largest general machinist and iron foundry business in New England. The foundry department will make castings in brass, bronze and aluminum, in addition to the regular production of gray iron and semi-steel. All the other departments—engineering, research, pattern, machine and instrument—will continue their usual activities.

Comprehensive Program Formulated for Power Transmission Association

The preparation of a practical handbook on the subject of mechanical power transmission is an important activity to be undertaken by the Power Transmission Association's board of advisory engineers, which is headed by William Staniar, transmission engineer of E. I. du Pont de Nemours & Co., Wilmington, Del. "While the theory has not changed there is a great difference in the design and present-day practice, which makes it very desirable to have an up-to-date reference book giving practical data on the use of our products," said W. H. Fisher, secretary of the T. B. Wood's Sons Co., Chambersburg, Pa., in his presidential address at the annual meeting of the association, held at the Hotel Commodore, New York, Dec. 7.

Publishing of information relating to the economies and efficiencies of the various mechanical power transmission methods, appurtenances and accessories was also recommended by the association's advisory engineers. This information would serve to point out the economy that can be effected by the efficient use of the group and direct methods of drive. It would aim to advise users impartially of the newest developments in equipment by which greater efficiency and economy may be obtained, and to emphasize the necessity of good engineering practice to simplify the transmission of power by the correct uses of equipment. It would also provide data regarding lubrication and general maintenance of mechanical transmission equipment, and information on obsolescence. Important general test data now in possession of individual members would be published for the benefit of the association and power users.

It was also recommended that a study be made of the best method of assisting users of transmission equipment in their efforts to obtain the best service, and eliminate losses from incorrect use or poor condition. The development of simple apparatus for testing alinement of shafting was suggested. In this connection it was thought that electrical manufacturers should provide a simple method for alining motors.

Another proposal was the publishing of a list, covering principal industries, showing representative good examples of the use of the various types of belting and transmission equipment. Promotion of standardization and simplification was advocated. It was suggested also that the American Society of Mechanical Engineers create a professional division or section of its present Power Division to provide a forum for the discussion of transmission problems.

Ask Modification of Decision in Consolidated Southwestern Cases

WASHINGTON, Jan. 24.—Modification of the decision of the Interstate Commerce Commission in the Consolidated Southwestern Cases is asked in a petition filed yesterday by the East Side Manufacturers' Association, made up of members of the industrial district of St. Louis, and by the Steel Consumers and Shippers' Conference, made up of scrap consumers in Arkansas, Louisiana, Oklahoma, Texas, Missouri and Kansas. The East Side Manufacturers' Association asks that the commission add spiral columns or column hoops, knocked down or collapsed; iron or steel joints for concrete road construction, and iron and steel pins and joists to a list of articles included in the finding. The scrap consumers ask that the report be modified to the extent that wherever rates are in effect upon a lower basis than those prescribed there shall be no warrant for an increase in such rates.

LeBlond Interested in Airplane Motors

CINCINNATI, Jan. 23.—Plans have been formulated by R. K. LeBlond to establish a plant at Cincinnati in which airplane motors for commercial type planes will be built. Whether the new plant will be a part of the R. K. LeBlond Machine Tool Co., or a separate division of it, has not been determined. Negotiations now are under way for acquiring the assets of the Detroit Aircraft Engine Co., which has been declared bankrupt. Glenn Angles, owner of the patents of the motors, and Robert Winters, both of whom have been associated with the Detroit company, have become affiliated with the LeBlond interests. The motors, which are of the radial air-cooled type, are somewhat similar to the Wright whirlwind engine and are to be made in two series of three sizes, ranging from a 50-hp. three-cylinder motor to a 165-hp. nine-cylinder engine.

Michigan Engineering Conference

The third Michigan Engineering Conference, sponsored by 23 engineering groups, will be held at the Hotel Statler, Detroit, Jan. 27 and 28.

The program includes addresses and papers on the relation of the engineer to management; welding; the X-ray as an engineering tool; commercial aviation, and electrification of steam railroads. Alexander Dow, president of the Detroit Edison Co. and president of the American Society of Mechanical Engineers, will preside at the afternoon session, Jan. 27.

Iron and Steel Markets

Plates, Shapes and Bars Advanced

Price Increase of $1 a Ton Expected to Drive in First Quarter Specifications—Structural Orders and Railroad Buying Feature Market

PRICE advances, heavier production and a further broadening of consumption are salient features of a stronger steel market.

Following an advance of $1 a ton on plates, shapes and bars, announced last Thursday by Steel Corporation mills, similar action has been taken by most independents. Since the new prices—1.85c. at Pittsburgh and proportionately higher quotations at other basing points—are limited to orders taken for delivery during the current quarter, the inference is that another advance is contemplated, with 2c., Pittsburgh, as a possible objective on second quarter business.

The initial effect of the higher prices will probably be a release of specifications against first quarter contracts, as well as the clinching of orders that were withheld pending additional signs of market strength. In fact, the volume of new business closed since Jan. 1 has probably been underestimated by the trade. Though heavy specifications were entered against expiring contracts in December and shipments against fourth quarter commitments are still being made, the gain in the Steel Corporation's unfilled tonnage this month promises to be substantial even though it fall considerably short of the sharp increase reported Dec. 31.

Construction work and railroad buying are conspicuous as sources of tonnage business. The week has been one of the largest on record in lettings of fabricated steel work, and it has added 100,000 tons to rail mill backlogs. The largest rail order, 40,000 tons, placed by the Rock Island, was divided, 35,000 tons going to the Gary mill and the remainder to the Indiana Harbor producer. Rail commitments of American mills, it is estimated, are fully 150,000 tons larger than at this time a year ago. Railroad equipment buying promises to continue to be an important market factor, with orders for 3000 cars from the St. Louis-San Francisco and 1000 from the Central of Georgia in early prospect. Steel specifications received from car builders by Chicago mills during the week total 13,000 tons.

Better farmer buying is reflected in the steel consumption of implement manufacturers, which is 10 per cent heavier than a year ago. There is a good flow of business from the automobile industry, although motor car output has not increased so rapidly as was anticipated. At Cleveland, demand for sheets and strip from stamping plants and other parts makers is not so heavy as earlier in the month, when liberal specifications for early needs were released. At Chicago, however, the automotive trade has passed the farm implement industry as the leading taker of bar shipments.

Demand for tubular goods lags, and pipe mill operations do not exceed 60 per cent of capacity. Steel mill output generally, however, has shown a further gain. Steel Corporation plants are running at 82 per cent of capacity, as compared with 78 per cent last week and 75 per cent two weeks ago.

Award of 57,800 tons of steel for the Cleveland Union Terminal to the Steel Corporation's fabricating subsidiary brought the week's total of structural contracts to more than 103,000 tons. Other outstanding lettings were 15,000 tons for a building in Boston, 8000 tons for a bank in Chicago and 7000 tons for subway work in New York. Among new inquiries for 23,000 tons is 7000 tons for a bascule bridge in Milwaukee.

Efforts of manufacturers of hot-rolled and cold-rolled strip steel to obtain higher prices are chiefly with an eye to second quarter business, since with few exceptions they are committed against probable production in this quarter. The objective of hot-rolled strip makers is 1.90c., Pittsburgh, for wide material and 2.10c. for narrow sizes, but orders for delivery in this quarter are being accepted at $2 a ton less. The advance of $3 a ton on cold-rolled strip, effective Jan. 25, has not been generally followed and, like the move on hot strip, is regarded as an aim for second quarter.

Following the advance of $1 a ton on hot-rolled bars, makers of cold-finished steel bars and shafting may soon announce an advance of $2 a ton in an attempt to obtain a wider spread between their raw material and finished product. Meanwhile, 2.20c., Pittsburgh, is being firmly maintained.

Pig iron markets are less active, as consumers are nearly all covered for their first quarter needs, but the week brought sales of 19,000 tons at Cleveland. Lake Erie iron is being offered in Chicago at slightly less than $18 for shipment by water when navigation opens, and slight weakness has developed in New England. At Birmingham, basic iron has declined $1 to $15.

Old material prices have not developed the strength that the scrap trade expected would result from increased operations at steel plants.

The competitive position of American steel in export markets has been favorably affected by growing firmness in European prices concurrent with the introduction of a shorter working day in German mills.

Exports of iron and steel in 1927 were 2,180,969 gross tons, a slight gain over the 2,167,213 tons of 1926. Imports fell off from 1,110,049 tons in 1926 to 750,467 tons in 1927, due largely to reduced incoming tonnages of pig iron. Tin plate was the largest export item in 1927, with 254,131 tons, and wrought pipe provided 248,415 tons.

No change occurred this week in either of THE IRON AGE composite prices.

*The average switching charge for delivery to foundries in the Chicago district is 61c. per ton.

On export business there are frequent variations from the above prices. Also, in domestic business, there is at times a range of prices on various products, as shown in our market reports on other pages.

Pittsburgh

Steel Market Makes a Better Showing—Advance of $1 on Plates, Shapes and Bars

PITTSBURGH, Jan. 24.—The steel market is making a showing in keeping with the developments in main consuming lines that were expected to contribute to a good year. Predictions of good business were founded largely on expected expansion in railroad rolling stock purchases, the recovery by the motor car industry of the ground it lost in 1927, improvement in the oil industry, a fairly well sustained amount of building and construction, and the stimulating effect of a prosperous agricultural year. Improvement yet is to show in the oil industry, and building and construction work has not reached large proportions, but there is reflection of the increased buying power of the farmers. The automobile industry, although not yet in the stride of production of which it is capable, has registered a substantial rally from the low point of late last year and there is fairly full reflection of expectations as to railroad car buying.

It is early for complete rounding out of anticipated business, but despite that fact the steel industry has moved up to an ingot production averaging approximately 75 per cent of capacity, and the trade naturally looks confidently ahead to further expansion as the consuming industries not now active reach a better stride.

Events of the week have been chiefly in connection with prices. The Carnegie Steel Co. advanced prices of bars, plates and shapes $1 a ton to 1.85c., base, Pittsburgh, as of Jan. 19, and in this move, which made the new base effective only for the remainder of this quarter, there was prompt following by independent companies. Definitely stronger price ideas are entertained by strip steel makers, but these are with reference to second quarter business, since with few exceptions manufacturers are committed fully against probable production for this quarter. Following the advance in hot rolled bars, it is probable that makers of cold-finished bars will soon seek higher prices. Sheet makers are hampered in getting advances in this quarter by the fact that they are heavily obligated against what they will produce.

A striking argument for the need of better steel prices comes in the report of the Jones & Laughlin Steel Corporation for the final quarter of last year, when that company, despite its size and the fact that it is entirely self-contained, failed to earn its dividend requirements for the period by more than $300,000. It was the first time since the company began reporting earnings four years ago that it has not shown a surplus in every quarter.

Good specifications are reported for sheets, strips, cold finished steel bars and tin plate, and the new demand for wire products, apart from nails, is reported to be better than it has been, but the effect of heavy specifications last month in bars, plates, shapes and wire nails is reflected now in rather moderate shipping releases. With February requirements just ahead, plus the advance in the prices of the heavy tonnage products, the remaining days of the month should be marked by an increase in specifications. Some mills are yet to complete shipments against fourth quarter tonnages of bars, plates and shapes, but it is commonly said that low-priced orders in these products as well as in cold finished steel bars will be well completed by the end of the month.

Pig Iron.—The only business of consequence lately before the market was an inquiry from the Pressed Steel Car Co. for 1000 tons of car wheel iron running low in silicon and high in manganese. This business is reported to have gone to steel companies, but there is no information as to the price. Iron for that purpose usually is off-grade basic and the price is determined by the price of standard basic. Otherwise business has been almost entirely of lots of one or two carloads, with some melters who ordinarily buy ahead now depending on spot offerings. Prices are unchanged. The Carnegie Steel Co. is reported to be making ready to start a furnace at its Farrell, Pa., works.

Prices per gross ton, f.o.b. Valley furnace:

Basic	$17.00
Bessemer	17.50
Gray forge	16.75
No. 2 foundry	17.25
No. 3 foundry	16.75
Malleable	$17.25 to 17.50
Low phosphorus, copper free	27.00

Freight rate to the Pittsburgh or Cleveland district, $1.76.

Ferroalloys.—Consumers of the commonly used ferroalloys are specifying against contracts very steadily and some users of spiegeleisen are exceeding their monthly quotas. Producers are holding firmly to $100, seaboard, for ferromanganese.

Fluorspar.—A good-sized lot of domestic gravel spar, recently placed by an eastern Ohio steel company, went at $14.50 per net ton, at mines, and apparently that is the ruling price on tonnages of more than a carload. Although most steel companies are usually willing to pay a premium for domestic fluorspar, they now are able to get it at practically the same delivered price as the foreign material. Foreign spar at $16, Atlantic seaboard, is $19.66, delivered Pittsburgh district, while domestic spar at $14.50 at mines is $19.75, delivered in this district.

Semi-Finished Steel.—Users of wire rods who elected to depend upon the spot market and did not avail themselves of a chance to cover for this quarter prior to the advance to $42, base Pittsburgh or Cleveland, have found it necessary to pay the higher price. Several fair-sized tonnages have been sold at $42, base, in the past week. Pittsburgh and Youngstown steel companies are quoting large billets and slabs at $33 and sheet bars and small billets and slabs at $34. The open market in these forms of steel is no broader than it has been for some time because of the fact that so many non-integrated manufacturers are tied up to regular sources of supply and the business no longer is competitive. Pipe skelp also moves largely on private arrangements between producers and consumers.

Bars, Plates and Shapes.—The advance in these products of $1 a ton to 1.85c., base Pittsburgh, announced by the Carnegie Steel Co. last Thursday, has been followed by the independent producers in this district and in all cases it became effective upon announcement and was for business placed for shipment during the remainder of this quarter. All manufacturers still have some tonnage priced at 1.75c., base, to work off, and have not advanced very far into 1.80c. business. Specifications lately have been a little slow, as is quite natural in view of heavy December specifications for January shipment, but last week's advance is counted on to stimulate shipping instructions, which usually expand in the last week of each month. The mills are said to have an objective of 2c., base, on second quarter contracts. Reinforcing bars now are priced at 1.95c., base, to other than recognized mill distributers, but the market still is quotable at a range of 1.90c. to 1.95c., since there has been business within the week at the lower figure.

Rails and Track Supplies.—Little new tonnage in standard-section rails remains to be bought by roads which normally place part or all of their requirements in Pittsburgh, but the local producing unit has a good order book and is running practically full. Light-section rails are slow and sales usually are of single carloads. Track accessories seem to wait on the opening of the track-laying season for specification. Spikes still are quoted at $2.80, base, per 100 lb., but it is understood that a preferential of $2 a ton has been and still is being extended to the steam railroads, as distinct from sales to jobbers. Railroads also are able to buy track bolts at less money than jobbers.

Wire Products.—New business in nails is of moderate proportions, with jobbers still getting shipments on December orders and specifications, but there has been considerable quickening in the demand for other wire products, notably plain wire, while the increasing production of automobiles is bringing a better demand for spring wire. Wire prices, recently weak in the Middle West, are reported to have strengthened and against recent sales at $2.35, base, per 100 lb., Chicago, it is now said that $2.45 is the ruling price.

Tubular Goods.—It is a little early for much demand for pipe in connection with building and construction work and oil country pipe waits on some definite improvement in the oil industry. Several pipe line projects are mentioned, but they are not moving very rapidly toward mill order books. Locomotive boiler tubes are doing a little better and mechanical tubing is selling fairly well as the motor car industry shapes plans for increased production. There is nothing new as to prices.

Sheets.—Specifications against late 1927 orders are coming in freely, but shipments on these specifications are supplying almost all of the current requirements and new business does not amount to much. It still is difficult for the mills to get the prices they announced on first quarter business, not only because wants not covered by contract are so few and small, but because there are few makers who will refuse to extend original orders to apply to new requirements that develop. Mill operations have receded slightly in the past week, partly because of the fact that production the fore part of the month was a little too heavy for the specifications. Some fair-sized orders are coming from automobile body builders, but demand from that source still has room to expand, since production of motor cars has not mounted nearly as rapidly as might be imagined from the optimistic utterances as to car sales. What is wanted, however, is wanted in a hurry, indicating light stocks in consumers' hands.

	Chromium Molybdenum spring steel (1 — 1.25 Chrom., 0.30 — 0.50 Molybdenum)	4.50 to 4.75

Above prices are for hot-rolled steel bars, forging quality. The ordinary differential for cold-drawn bars is 1c. per lb. higher. For billets 4 x 4 to 10 x 10 in. the price for a gross ton is the net price for bars of the same analysis. For billets under 4 x 4 in. down to and including 2½ in. squares, the price is $5 a gross ton above the 4 x 4 billet price.

---

*Not S. A. E. specification, but numbered by manufacturers to conform to S. A. E. system.

Rails

	Per Gross Ton
Standard, f.o.b. mill	$43.00

Hot Rolled

2 and 2¼ in.	37	3¼ and 3½ in.	53
2½ and 2¾ in.	45	4 in.	56
3 in.	51	4½, 5 and 6 in.	51

Less carloads, 4 points less. Add $8 per net ton for more than four gages heavier than standard. No extra for lengths up to and including 24 ft. Sizes smaller than 1 in. and lighter than standard gage to be held at mechanical tubes list and discount. Intermediate sizes and gages not listed take price of next larger outside diameter and heavier gage.

Seamless Mechanical Tubing

	Per Cent Off List
Carbon, 0.10% to 0.30%, base	55
Carbon, 0.30% to 0.40%, base	50

Plus differentials for lengths over 18 ft. and for commercial exact lengths. Warehouse discounts on small lots are less than the above.

Tin Plate.—Mill operations are sustained at about 75 per cent of capacity. Specifications are largely in for March quotas and it will be another fortnight before they begin to come along for April shipment. Some light on the prospects is likely to develop at the canners' convention, which is being held this week in Chicago.

Cold-Finished Steel Bars and Shafting.—There has been little or no recession in the specifications from the high rate attained last month. Producers are well satisfied with the price situation. It seems that in getting contracts for this quarter at 2.20c., base Pittsburgh, much resistance was encountered in the Detroit district, as that price represented an advance of $2 a ton, while other steel products were either unchanged or lower. But there was no weakening in the price. It is now likely that another advance will be made to cover the recent advance in hot-rolled bars, and as makers believe they are entitled to a greater spread between the hot and cold bar price, the advance probably will be $2 a ton, against $1 a ton in hot-rolled bars.

Bolts, Nuts and Rivets.—Improved railroad demand gives the market for bolts and nuts an activity it has recently lacked. Rivets still are rather dull, but prices of all three lines are firm.

Hot-Rolled Flats.—The objective of producers is 2.10c., base, Pittsburgh, for material narrower than 6 in. and 1.90c., base, for widths 6 in. to 12 in., but there continues to be acceptance of orders for delivery in this quarter at concessions of $1 to $2 per ton from those prices. Specifications against orders placed late last year continue to run well ahead of those of last month, but there is rather general dissatisfaction among mills over the price returns.

Cold-Rolled Strips.—Announcement by one large producer of an advance of $3 per ton to 2.90c. for lots of three tons or more and to 3.15c. for lots of one to less than three tons, has not yet been generally followed by other makers. The new prices are regarded as applying on second quarter business. Orders for this quarter still are being taken at 2.75c. and 3c.

Coal and Coke.—Beehive oven coke producers still are finding it difficult to market their outputs, which, though small by ordinary comparisons, are large in view of the fact that offerings of by-products ovens are liberal. Single carloads of beehive oven furnace coke are salable at $2.75, but on larger lots the prevailing price is $2.65. Spot beehive oven foundry coke is readily obtainable at $3.75 to $4. There is a fairly firm market for slack coal, but in other grades the market is as dull and favors buyers as much as ever.

Old Material.—Blast furnace scrap is not easily sold except at a concession from recent prices and machine shop turnings have been sold as low as $10.50, this also marking a decline from prices of a week ago. In other grades, prices are substantially unchanged, except that sales of the railroad specialties no longer are easily made at more than $17. Consumer interest is low and dealers, not being pressed for deliveries on old sales, are not offering the market much support.

Agricultural	14.00 to	14.25

Hearing in Pig Iron Dumping Case

Hearings were held before the Customs Court at Philadelphia, Jan. 10 and 11, on a charge of violation of the anti-dumping act brought against Hickman, Williams & Co., pig iron brokers, Philadelphia. The defendants imported more than 5000 tons of German pig iron last summer through the port of Norfolk, Va. The admission was made that the iron was bought at less than prevailing prices in Germany, but the argument was advanced that lower prices for wholesale lots are specifically permitted under the provisions of the Federal act.

Invoices of domestic sales by the German producer showed prices that were in no case more than seven marks higher than the price paid by the American importer. These sales, moreover, covered small lots, the largest calling for 400 tons.

Jones & Laughlin Report Deficit of $340,333 for Last Quarter

The Jones & Laughlin Steel Corporation, Pittsburgh, reports a deficit after the payment of dividends of $340,333 for the quarter ended Dec. 31, while its surplus for the year of $4,293,002 compares with $8,578,235 in 1926. Net income for the final quarter of last year was $1,397,123, or $340,333 less than the quarter's dividend requirements. Surplus at the end of last year amounted to $53,413,072, compared with $49,270,070 at the end of 1926.

Decline in Malleable Castings Production in 1927

WASHINGTON, Jan. 24.—Production of malleable castings by 134 identical plants in 1927 totaled 631,388 tons, while bookings aggregated 564,158 tons, against 715,384 tons and 607,949 tons respectively in 1926, according to the Department of Commerce. Shipments were 609,134 tons and 684,582 tons. The rated capacity in 1927 was 1,253,849 tons, so operation was at 50.4 per cent. Capacity in 1926 was 1,307,889 tons, and operation was at 54.7 per cent.

	Per Gross Ton		*Per Gross Ton*
6%	$23.00	10%	$28.00
7%	24.00	11%	30.00
8%	25.00	12%	32.00
9%	26.00		

Other Ferroalloys

Ferrotungsten, per lb. contained metal, del'd	92c. to 95c.
Ferrochromium, 4 to 6% carbon and up, 65 to 70% Cr., per lb. contained Cr. delivered, in carloads	11.00c.
Ferrovanadium, per lb. contained vanadium, f.o.b. furnace	$3.15 to $3.65
Ferrocarbontitanium, 15 to 18%, per net ton, f.o.b. furnace, in carloads	$200.00
Ferrophosphorus, electric or blast furnace material, in carloads, 18%, Rockdale, Tenn., base, per net ton	$91.00
Ferrophosphorus, electric, 24%, f.o.b. Anniston, Ala., per net ton	$122.50

Fluxes and Refractories

Fluorspar

	Per Net Ton
Domestic, 85% and over calcium fluoride, not over 5% silica, gravel, f.o.b. Illinois and Kentucky mines	$14.50 to $15.00
No. 2 lump, Illinois and Kentucky mines	$20.00
Foreign, 85% calcium fluoride, not over 5% silica, c.i.f. Atlantic port, duty paid	$16.00
Domestic, No. 1 ground bulk, 95 to 98% calcium fluoride, not over 2½% silica, f.o.b. Illinois and Kentucky mines	$32.50

Fire Clay

Per 1000 f.o.b. Works

	First Quality	Second Quality
Pennsylvania	$43.00 to $46.00	$35.00 to $38.00
Maryland	43.00 to 46.00	35.00 to 38.00
New Jersey	50.00 to 65.00	———
Ohio	43.00 to 46.00	35.00 to 38.00
Kentucky	43.00 to 46.00	35.00 to 38.00
Missouri	43.00 to 46.00	35.00 to 38.00
Illinois	43.00 to 46.00	35.00 to 38.00
Ground fire clay, per ton	7.00	

Silica Brick

	Per 1000 f.o.b. Works
Pennsylvania	$43.00
Chicago	52.00
Birmingham	50.00
Silica clay, per ton	$8.50 to 10.00

Magnesite Brick

	Per Net Ton
Standard sizes, f.o.b. Baltimore and Chester, Pa.	$65.00
Grain magnesite, f.o.b. Baltimore and Chester, Pa.	40.00

Chrome Brick

	Per Net Ton
Standard size	$45.00

Mill Prices of Bolts, Nuts, Rivets and Set Screws

Bolts and Nuts

Per 100 Pieces

(F.o.b. Pittsburgh, Cleveland, Birmingham or Chicago)

	Per Cent Off List
†Machine bolts	70
†Carriage bolts	70
Lag bolts	70
Plow bolts, Nos. 1, 2, 3 and 7 heads	70
Hot-pressed nuts, blank or tapped, square	70
Hot-pressed nuts, blank or tapped, hexagon	70
C.p.c. and t. square or hex. nuts, blank or tapped	70
Washers*	6.75c. to 6.50c. per lb. off list

---

*F.o.b. Chicago, New York and Pittsburgh.

†Bolts with rolled threads up to and including ⅝ in. x 6 in. take 10 per cent lower list prices.

Bolts and Nuts

	Per Cent Off List
Semi-finished hexagon nuts	70
Semi-finished hexagon castellated nuts, S.A.E.	70
Stove bolts in packages	80, 10 and 5
Stove bolts in bulk	80, 10, 5 and 2½
Tire bolts	60, 5 and 5

Discount of 70 per cent off on bolts and nuts applied on carload business. For less than carload orders discounts of 55 to 60 per cent apply.

Large Rivets

(½-In. and Larger)

	Base per 100 Lb.

Upset hex. cap screws, S.A.E. thread	85 and 5
Upset set screws	80, 10 and 10
Milled studs	70 and 5

Chicago

Western Mills Advance $1 on Heavy Steel Products—13,000 Tons for Cars

CHICAGO, Jan. 24.—Announcement was made last Thursday by the Illinois Steel Co. that, effective at once, prices for plates, shapes and bars were advanced $1 a ton on all new business for delivery before April 1, and that second quarter prices would be made public later. Independent mills have followed suit. This move has tended to accelerate specifying, though temporarily at least it is acting as a checkmate to buying. A test of the new prices is lacking.

The St. Louis-San Francisco's car order is being delayed while alternative bids are being taken on hopper cars of smaller capacity. Specifications from car builders call for the immediate delivery of 5000 tons of sheets, 4000 tons of plates, 2500 tons of shapes and 1500 tons of bars.

In heavy steel products total specifications against first quarter contracts equal those of a week ago. Accumulation of plates, shapes and bars by buyers through speculation prior to Dec. 31 at fourth quarter contract prices was not heavy and has had little effect on this market in the opening weeks of the year. In sheets the situation is different and it has taken the first three weeks of 1928 to write off the bulk of tonnage carried into the new year on old contracts.

A $10,000,000 bond issue has been underwritten on Chicago's new opera house, and brokers are expecting a $10,000,000 preferred stock issue this week.

Pig Iron.—Orders for second quarter iron, presumably for water shipment after the opening of navigation, are being solicited in this market at a shade under $18, base, delivered. It is rather commonly believed that sellers are accumulating orders against boat shipments which may assume large proportions in the second and third quarters. With the closing down of the second Mayville furnace, Milwaukee users of iron are again paying the freight rate from Chicago, which is $1 a ton, or 27c. above the rate that prevailed from Mayville. Local furnaces report active sales, the bulk being for second quarter delivery. Both orders and shipments are the highest so far this year. A price of $18 was named on about 20 cars of mill iron produced when a new stack was blown in. Local merchant furnaces are holding rigidly to $18.50 a ton.

Prices per gross ton at Chicago:

Northern No. 2 foundry, sil. 1.75 to 2.25	$18.50
N'th'n No. 1 fdy., sil. 2.25 to 2.75	19.00
Malleable, not over 2.25 sil.	18.50
High phosphorus	18.50
Lake Superior charcoal, averaging sil. 1.50	27.04
Southern No. 2 fdy. (all rail)	22.01
Southern No. 2 (barge and rail)	20.18
Low phos., sil. 1 to 2 per cent, copper free	$28.50 to 29.00
Silvery, sil. 8 per cent	29.79
Bessemer ferrosilicon, 14 to 15 per cent	46.79

Prices are delivered consumers' yards except on Northern foundry, high phosphorus and malleable, which are f.o.b. local furnace, not including an average switching charge of 61c. per gross ton.

Ferroalloys.—On the whole this market is quiet. It is reported in some quarters that an advance in ferromanganese is not unlikely.

Prices delivered Chicago: 80 per cent ferromanganese, $107.56; 50 per cent ferrosilicon, $83.50 to $87.50; spiegeleisen, 19 to 21 per cent, $38.76 to $39.76.

Plates.—This market is unusually active and mills which are fortified with well balanced order books are not now promising deliveries in less than three to four weeks, an extension of 10 days since a week ago. Car builders have entered specifications for 4000 tons and an order for 5000 tons of wide plates for use in oil tank construction is for delivery at the earliest convenience of the producers. Miscellaneous users are feeling the pinch of short range specifications and in some cases are now getting additional requirements piecemeal as mills find it desirable to apportion weekly rollings. Definite inquiry has developed for 2500 tons of plates for tank construction in Texas and several new projects are developing in that territory. Another factor contributing to the strength of the plate market is the increased activity of fabricators. Local producers have all fallen in line with the new prices and quotations now are 1.95c., Chicago, for 100 tons or more and 2.05c. for smaller lots. These apply only on current business for delivery in the first quarter. In view of contracts already closed mills will benefit by this increase only on spot business over the next two months.

Mill prices on plates per lb.: 1.90c. to 2.05c., base, Chicago.

Structural Material.—Fabricating plants tributary to Chicago mills have received contracts calling for 12,000 tons of steel. The largest award was the Forman Bank Building, Chicago, taking between 8000 and 8500 tons. A shop in Minneapolis will ship 2500 tons for erection at Fresno, Cal. Among active projects are the Steuben Club, 4500 tons, and an office building, 2400 tons, both in Chicago, and a bridge across the Illinois River at Pekin, Ill., 1700 tons. Recent bids by fabricators clearly indicate a stiffening in prices brought about not alone by changes in mill quotations but also by the determination of fabricators to widen margins of profit. Awards in the past three weeks have added heavily to shop books. Car builders have ordered out 2500 tons of structural shapes. Chicago mills have announced that effective at once spot prices on structural shapes for delivery during the remainder of this quarter are 1.95c. to 2.05c., Chicago, depending on the tonnage desired. The bulk of shipments in this quarter, however, will be at the old schedule, which was $1 a ton lower.

Mill prices on plain material per lb.: 1.90c. to 2.05c., base, Chicago.

Reinforcing Bars.—The Calumet Steel Co. was awarded 3000 tons of rail steel reinforcing bars for the Campbell Soup Co.'s plant in Chicago. Contractors on State and county road work in Illinois are preparing for spring work and the trade expects 3000 tons of bars to be placed in the next few days. The bulk of this tonnage will go to hard steel bar producers who are asking 1.85c. for bars that are to go into slabs and 1.90c. for bars to be used in bridges and culverts. Billet steel reinforcing bar awards are few, but active projects are numerous, and the outlook is favorable. The announcement of higher prices at mills is spurring dealers to put up warehouse prices. New business and fresh inquiry are shown on page 304.

Bolts, Nuts and Rivets.—Specifications are heavier following increased demand from the railroads, automobile manufacturers and car builders. Prices are steady.

Rails and Track Supplies.—Rail output is steady at 82 per cent of capacity. Buying is light but fresh inquiry, including 35,000 to 40,000 tons required by the Rock Island, is active. Specifications for track accessories are large and tie plate production is now close to capacity. The light rail market is dull.

Prices f.o.b. mill, per gross ton: Standard-section open-hearth and Bessemer rails, $43; light rails, rolled from billets, $36. *Per Lb.:* Standard railroad spikes, 2.80c.; track bolts with square nuts, 3.80c.; steel tie plates, 2.25c.; angle bars, 2.75c.

Wire Products.—Demand for wire products is broadening and mill output has been advanced to 65 per cent of capacity. The bulk of business from the jobbing trade comes from the South and Middle West, the Northwest being winter-bound. A more extensive use of wire is noted in the manufacturing trade. The price situation is less well defined than a week ago. St. Louis remains the battle ground for producers in the South and in the Middle States. Shading in wire prices has developed in Iowa, though the volume of business transacted is not large. In the local market prices for both wire and nails are holding moderately well though buyers of nails in some instances are now exercising protective agreements made in December at prices that range from $2.45 to $2.50, Chicago.

Bars.—There is little of note in this market except in the announcement by Chicago producers that spot sales of soft steel bars during the remainder of this quarter are to be $1 above quotations on which present contracts are based. As a general thing users are well covered and therefore the tonnage that will be shipped against the new prices will be small as compared to total deliveries over the three months period. The new quotations are 1.95c., Chicago, to 2.05c., depending on the tonnage. Specifications, including 1500 tons from car builders, are steady but sales are measurably smaller. The automobile trade has assumed leadership over agricultural machinery manufacturers in bar shipments. No change is noted in the ability of mills to make deliveries. Producers of iron bars have not followed the lead of soft steel bar mills in advancing prices, but this move is under consideration and may take place before the end of the week. Production of alloy steel bars has been advanced to 85 per cent of mill capacity. Sales in rail steel bars are dragging, but specifications are heavier and now equal production. Mill output has not been increased, although stocks are not considered large for this time of the year. Fence post order books have expanded rapidly in the last week. Prices are steady at 1.80c., Chicago Heights mills.

Mill prices per lb.: Soft steel bars, 1.90c. to 2.05c., base, Chicago; common bar iron, 1.90c., base, Chicago; rail steel bars, 1.80c., base, Chicago Heights mill.

Sheets.—Current buying is small and specifications do not bulk larger than a week ago. Hot mills are operating at only 65 per cent of capacity. Prices are steady and deliveries are prompt.

Base prices per lb., delivered from mill in Chicago: No. 24 black, 3.05c.; No. 24 galvanized, 3.90c.; No. 10 blue annealed, 2.25c. to 2.35c. Delivered prices at other Western points are equal to the freight from Gary plus the mill prices, which are 5c. per 100 lb. lower than the Chicago delivered prices.

Cold Rolled Bars.—Prices are firm at 2.20c., Chicago. Shipments are gradually growing larger but current buying is of small proportions. Deliveries have extended and now range from seven to 10 days on orders that have to be made up. Producers have well-assorted stocks on hand and are drawing against them in preference to expanding production.

Cold Rolled Strip.—Local producers announce that effective Jan. 25 cold rolled strip in widths up to 12 in. and in lots of one to less than three tons will be quoted at 3.15c., base f.o.b. Cleveland, or 3.45c., delivered Chicago. A deduction of 25c. per 100 lb. will be allowed on items of three tons or more. Users are being notified of this change, thus affording them opportunity to cover at the old schedule. Buying is brisk and specifications are the heaviest in many months. Deliveries are extended to four or five weeks.

Cast Iron Pipe.—This commodity is only moderately active at prices that show no improvement. Inquiry for small tonnages is a trifle more brisk but projects are slow in developing into orders. The McWane Cast Iron Pipe Co. is reported to have taken 2000 tons for Yellow Springs, Ohio. Portsmouth, Ohio, is holding bids open on 600 tons. Minneapolis is taking figures on 3500 ft. of 4-in. to 24-in. pipe That city usually buys centrifugal pipe but on this occasion bids are also asked on the sand cast product.

Prices per net ton, delivered Chicago: Water pipe, 6-in. and over, $34.20 to $36.20; 4-in., $38.20 to $40.20; Class A and gas pipe, $4 extra.

Hot Rolled Strip.—Prices are weak and common quotations on all gages wider than 6 in. are 2.10c. to 2.20c. and on narrow widths 2.30c. to 2.40c.

Warehouse Prices, f.o.b. Chicago

	Base per Lb.
Plates and structural shapes	3.10c.
Soft steel bars	3.00c.
Reinforcing bars, billet steel	2.25c. to 2.75c.
Cold-finished steel bars and shafting—	
Rounds and hexagons	3.60c.
Flats and squares	4.10c.
Bands	3.65c.
Hoops	4.15c.
Black sheets (No. 24)	3.95c.
Galvanized sheets (No. 24)	4.80c.
Blue annealed sheets (No. 10)	3.50c.
Spikes, standard railroad	3.55c.
Track bolts	4.55c.
Rivets, structural	3.60c.
Rivets, boiler	3.60c.
	Per Cent Off List
Machine bolts	60
Carriage bolts	60
Coach or lag screws	60
Hot-pressed nuts, squares, tapped or blank	60
Hot-pressed nuts, hexagons, tapped or blank	60
No. 8 black annealed wire, per 100 lb.	$3.20
Common wire nails, base per keg	$2.90 to 3.00
Cement coated nails, base per keg	2.90 to 3.00

Coke.—The Chicago market is active and by-product foundry coke is quoted $9, f.o.b. local ovens, and at $9.50, delivered in the switching district.

Old Material.—Although a fair amount of inquiry is before the trade, it develops slowly. Interest in this market centers in the efforts of dealers to cover orders recently booked. Trading in heavy melting steel is at $12.50 to $12.75. Prices as a general rule lean toward the weak side, primarily because of lack of buying interest. Speculation is in evidence as brokers continue to bid up railroad lists. An oversupply of cast iron borings is causing prices to sag. Malleable users are buying little following purchases made under the condition that shipments would be made promptly. Although the immediate demand for short rails is smaller there still exists a shortage. Included in railroad lists are 9000 tons offered by the St. Paul, 4000 tons by the Burlington and a blank list by the Michigan Central.

Prices delivered consumers' yards, Chicago:

Per Gross Ton	
Basic Open-Hearth Grades:	
Heavy melting steel	$12.50 to $13.00
Shoveling steel	12.50 to 13.00
Frogs, switches and guards, cut apart, and miscellaneous rails	14.25 to 14.75
Hydraulic compressed sheets	10.75 to 11.25
Drop forge flashings	9.75 to 10.25
Forged, cast and rolled steel carwheels	15.50 to 16.00
Railroad tires, charging box size	16.25 to 16.75
Railroad leaf springs, cut apart	16.25 to 16.75
Acid Open-Hearth Grades:	
Steel couplers and knuckles	14.50 to 15.00
Coil springs	16.50 to 17.00
Electric Furnace Grades:	
Axle turnings	13.00 to 13.50
Low phosphorus punchings	14.25 to 14.75
Low phosphorus plate, 12 in. and under	13.50 to 14.00
Blast Furnace Grades:	
Axle turnings	10.75 to 11.25
Cast iron borings	10.25 to 10.75
Short shoveling turnings	10.25 to 10.75
Machine shop turnings	7.50 to 8.00
Rolling Mill Grades:	
Iron rails	13.50 to 14.00
Rerolling rails	15.00 to 15.50
Cupola Grades:	
Steel rails less than 3 ft.	15.25 to 15.75
Angle bars, steel	14.00 to 14.50
Cast iron carwheels	14.00 to 14.50
Malleable Grades:	
Railroad	13.75 to 14.25
Agricultural	12.50 to 13.00
Miscellaneous:	
*Relaying rails, 56 to 60 lb.	23.00 to 25.00
*Relaying rails, 65 lb. and heavier	26.00 to 31.00
Per Net Ton	
Rolling Mill Grades:	
Iron angle and splice bars	14.00 to 14.50
Iron arch bars and transoms	18.75 to 19.25
Iron car axles	21.50 to 22.00
Steel car axles	16.00 to 16.50
No. 1 railroad wrought	11.00 to 11.50
No. 2 railroad wrought	11.00 to 11.50
No. 1 busheling	9.25 to 9.75
No. 2 busheling	4.25 to 4.75
Locomotive tires, smooth	12.50 to 13.00
Pipes and flues	8.00 to 8.50
Cupola Grades:	
No. 1 machinery cast	14.50 to 15.00
No. 1 railroad cast	13.50 to 14.00
No. 1 agricultural cast	13.50 to 14.00
Stove plate	12.00 to 12.50
Grate bars	11.50 to 12.00
Brake shoes	11.75 to 12.25

*Relaying rails, including angle bars to match, are quoted f.o.b. dealers' yards.

Youngstown-Inland Merger on Eve of Consummation

YOUNGSTOWN, Jan. 24.—Since Monday morning L. E. Block, P. D. Block and other officials of the Inland Steel Co., Chicago, have been in conference with President James A. Campbell and officers of the Youngstown Sheet & Tube Co. relative to a merger of the two concerns. Here it is believed that the merger is virtually assured, only details remaining to be worked out. Mr. Campbell, it is expected, will head the consolidation. It was announced tonight that a statement would be issued Wednesday.

New York

Bethlehem Advances Heavy Steel Products $1—Pig Iron More Active

NEW YORK, Jan. 24.—The pig iron market continues to show gradual improvement. Shipping orders are heavier and the volume of inquiry is growing. One large melter is in the market for 2500 to 3000 tons of foundry iron for delivery during the four months beginning March 1. Other inquiries, made up largely of relatively small individual lots, total 4000 tons. Sales by local brokers during the week were in good volume, totaling 7500 tons compared with 10,000 tons in the previous week. The New York Air Brake Co. closed for 1000 tons of malleable for second quarter delivery at Watertown, N. Y. Another melter closed for 1000 tons of foundry for next quarter. The New York Central Railroad bought about 300 tons against its inquiry for Frankfort, N. Y., and Elkhart, Ind., and the Delaware, Lackawanna & Western Railroad placed 100 tons for its Scranton, Pa., shops. The Worthington Pump & Machinery Corporation purchased 90 tons of Bessemer for its Harrison, N. J., plant. Efforts of sellers to obtain a minimum of $19.50, base furnace, on eastern Pennsylvania foundry iron, and of $16, base furnace, on Buffalo foundry are increasingly successful.

Prices per gross ton, delivered New York district:

Buffalo No. 2 fdy., sil. 1.75 to 2.25	$21.41 to $21.91
East. Pa. No. 2 fdy., sil. 1.75 to 2.25	20.39 to 21.52
East. Pa. No. 2 fdy., sil. 2.25 to 2.75	20.89 to 22.02
East. Pa. No. 1X fdy., sil. 2.75 to 3.25	21.39 to 22.52

Freight rates: $4.91 from Buffalo, $1.39 to $2.52 from eastern Pennsylvania.

Ferroalloys.—With consumers well covered for their immediate needs of ferromanganese, sales are confined to carload and small lots in which there has been a fair business done. The same is true of spiegeleisen and the prices for both alloys are unchanged at $100 for ferromanganese and at $31 to $32 for spiegeleisen. Specifications on contract for these and other ferroalloys are reported to be improving.

Finished Steel.—The Bethlehem Steel Co. on Monday announced an advance of $1 a ton on plates, shapes and bars at its mill basing points in the East and at Johnstown, Pa., for shipment during the remainder of first quarter. This follows the advance of the same amount by mills in the Pittsburgh, Youngstown and Chicago districts. Other Eastern mills are expected to follow Bethlehem's action. New mill prices are: 1.95c., Buffalo, on plates, shapes and bars; 2c., Bethlehem, on structural shapes; 2c., Coatesville and Sparrows Point, on plates, and 1.85c., Pittsburgh, for shipment from Johnstown. Delivered prices at New York on the new basis are 2.14½c. per lb. for shapes and 2.17½c. for plates, but these prices will not affect much of the tonnage to be shipped this quarter because of the heavy contracting done at former prices. Consumers and jobbers in the New York district are taking shipments in good volume against specifications filed with the mills a few weeks ago, but these shipments are providing for most of the current needs and new requirements are not in large volume. The leading Eastern producer of plates and shapes reports substantial improvement this month in the volume of business on its books, and points to a fair accumulation of active structural steel projects under negotiation. The amount of new tonnage coming out for bids in the past week was very light. The largest structural award was 7000 tons for a New York subway section to be fabricated by the McClintic-Marshall Co.

Mill prices per lb., delivered New York: Soft steel bars, 2.14c.; plates, 2.12½c.; structural shapes, 2.09½c.; bar iron, 2.14c.

Reinforcing Bars.—The market is seasonably quiet and there are few pending jobs involving good-sized tonnage. On the run of mill business prices are being well maintained on a basis of 1.90c. per lb., Pittsburgh. Distributers are quoting 2.20c., Youngstown warehouse, or 2.57½c., on cars at New York. Out of New York warehouse, the price is 2.80c. for lots of 5 tons or more, 2.95c. for lots of 2 to 5 tons and 3.24c. for less than 2 tons, all delivered at job.

Warehouse Business.—Demand is irregular, some jobbers reporting a moderate volume of purchasing, while others find but little activity. Prices show no change.

Coke.—Most consumers are fairly well covered on contract and there is but little inquiry for prompt shipment coke. Standard foundry is still quoted at about $4 per ton, Connellsville, and standard furnace at $2.75 to $3 per ton, Connellsville. Delivered prices on Connellsville foundry coke are: To northern New Jersey, $8.03; to New York or Brooklyn, $8.79; to Newark or Jersey City, $7.91. By-product foundry coke is quiet and unchanged at $9 to $9.40 per net ton, delivered Newark or Jersey City.

Warehouse Prices, f.o.b. New York

	Base per Lb.
Plates and structural shapes	3.34c.
Soft steel bars and small shapes	3.24c.
Iron bars	3.24c.

Cast Iron Pipe.—Although recent quotations of Northern makers have figured back to less than $28 per net ton, Birmingham, the actual freight rate involved was small and the Northern foundry price was close to $30 per ton, base. The City of New York has awarded 2200 tons of pipe to the National Cast Iron Pipe Co. and the Donaldson Iron Co., the low bidders. The New Haven Water Co., New Haven, Conn., is inquiring for about 2000 tons of 6, 8, 16, 36 and 42-in. water pipe. Stone & Webster, Inc., Boston, and the Adirondack Light & Power Co., Amsterdam, N. Y., are in the market for about 1000 tons of pipe each.

Prices per net ton, delivered New York: Water pipe 6-in. and larger, $37.25 to $38.25; 4-in. and 5-in., $42.25 to $43.25; 3-in., $52.25 to $53.25; Class A and gas pipe, $4 to $5 extra.

Old Material.—Prices of all grades show little change. Brokers shipping mixed borings and turnings to Swedeland, Pa., have advanced buying prices to $10.50 per ton, delivered, and machine shop turnings are being purchased at $10.50 to $11 per ton, delivered Phoenixville and Harrisburg, Pa. A dealer who was paying $13 per ton for specification pipe delivered to a Lebanon, Pa., consumer has reduced the offering price from 25c. to 40c. per ton. No. 1 heavy melting steel and yard grade of heavy melting steel are unchanged. Thus far the scrap market has failed to reflect the improvement in business reported by the steel mills.

Dealers' buying prices per gross ton, New York:

No. 1 heavy melting steel	$10.00 to $10.85
Heavy melting steel (yard)	6.75 to 7.25
No. 1 heavy breakable cast	11.25 to 12.00
Stove plate (steel works)	8.75 to 9.00
Locomotive grate bars	8.25 to 8.50
Machine shop turnings	6.75 to 7.50
Short shoveling turnings	7.00 to 7.50
Cast borings (blast furnace or steel works)	6.75 to 7.25
Mixed borings and turnings	7.00 to 7.50
Steel car axles	16.50 to 17.00
Iron car axles	23.75 to 24.75
Iron and steel pipe (1 in. diam., not under 2 ft. long)	8.75 to 9.00
Forge fire	6.50 to 7.00
No. 1 railroad wrought	10.50 to 11.00
No. 1 yard wrought, long	9.00 to 9.50
Rails for rolling	10.50 to 11.00
Cast iron carwheels	11.25 to 11.75
Stove plate (foundry)	8.75 to 9.00
Malleable cast (railroad)	10.00 to 10.50
Cast borings (chemical)	11.00 to 11.50

Prices per gross ton, delivered local foundries:

No. 1 machinery cast	$13.50 to $14.00
No. 1 heavy cast (columns, building materials, etc.), cupola size	11.50 to 12.00
No. 2 cast (radiators, cast boilers, etc.)	11.00 to 11.50

Cleveland

Structural Steel Award of 57,800 Tons for Cleveland Terminal Project

CLEVELAND, Jan. 24.—An order for 57,800 tons of structural steel was placed today by the Cleveland Union Terminals Co. with the American Bridge Co. for construction work in connection with the Cleveland Union Depot project. This included the station proper and other work in addition to buildings covered by an inquiry for 20,000 tons reported last week. Deliveries are to start May 1.

Independent mills generally have followed the Carnegie Steel Co. in advancing steel bars, plates and structural material to 1.85c., Pittsburgh, for delivery throughout the first quarter, and the indications are that these prices will be adhered to except for steel on which quotations or contracts were made before the advance. Local bar mills have made a similar advance to 1.85c., Cleveland. One Ohio plate mill has not yet made the advance. A large proportion of consumers are under contract for the quarter at 1.80c. Some of the mills will about complete shipments this month against specifications placed in December at 1.75c.

Some of the mills report a gain in specifications this month over December, although expiring contracts brought out a heavy tonnage during the latter month. Mills continue to get a good volume of specifications from the automotive industry in Michigan. Locally the demand for sheets and strip steel from stamping plants and other parts makers is not as heavy as earlier in the month, when consumers gave heavy specifications for early needs. Plates in small lots are moving better than for several months, business having improved with boiler and tank shops. The Sinclair Refining Co. has placed 42 stills with three shops. These will require 1700 tons of plates. Inquiry in the structural field has become more active.

Pig Iron.—Buying fell off somewhat the past week, but sales by Cleveland interests totaled about 19,000 tons. Activity subsided in the Michigan territory, where buying has recently been heavy, but showed a gain in the Buffalo territory. A few foundries are now showing interest in second quarter contracts. While some consumers have covered for the entire first half, the aggregate tonnage placed for delivery beyond March was small. However, many foundries evidently have covered in their first quarter contracts for enough iron to carry them well into the second quarter. A Muncie, Ind., foundry is inquiring for 3000 tons of malleable iron for the second quarter and a Fort Wayne consumer wants 500 tons of foundry iron. Other inquiries are light. There is virtually no change in the price situation, although the market is firmer in Michigan, where there is still a range of $17.50 to $18. Quotations on foundry and malleable iron by Lake furnaces range from $16.50 to $17, but producers are not going to the lower figure except for shipment to points where they are at a freight disadvantage. Regular silicon differentials are not being adhered to. Foundry operations show some gain in the northern Ohio territory and this has resulted in better shipping orders. Shipments to Michigan automobile foundries continue heavy.

Prices per gross ton at Cleveland:

N'th'n No. 2 fdy., sil. 1.75 to 2.25	$18.50
Southern fdy., sil. 1.75 to 2.25	22.00
Malleable	18.50
Ohio silvery, 8 per cent	28.00
Basic, Valley furnace	17.00
Standard low phos., Valley furnace	$26.50 to 27.00

Prices, except on basic and low phosphorus, are delivered Cleveland. Freight rates: 50c. from local furnaces; $3 from Jackson, Ohio; $6 from Birmingham.

Sheets.—Specifications continue good from the automotive industry and fair from other consumers. Although most buyers are under contract at the old prices, quite a little new business is being taken, mostly in black sheets with special finishes. The market shows a firmer tone except on galvanized sheets, 2.90c., Pittsburgh, for black and 2.10c. for blue annealed now being generally adhered to. Galvanized sheets are still available at 3.65c., Pittsburgh.

Strip Steel.—The demand for hot-rolled strip steel is heavy from the automotive industry but there is not much new business as most consumers are under contract. Prices are firm at 1.85c. for material 6 in. to 12 in. wide and at 2.05c. for narrower than 6 in. Several of the independent mills have not yet joined in advancing cold-rolled strip to 3.15c., base, but are still quoting 3c. as a Cleveland base price and 2.75c. for three tons and over.

Fluorspar.—The gravel fluorspar market has been fairly active the past week and most consumers are now covered for the first half. Sales included 2000 tons to a Cleveland mill and two other lots, one for 3000 tons and the other for 500 tons, all at $14.50, mines. Makers are still asking $15 for car lots.

Warehouse Business.—The demand shows a fair gain in practically all lines. The advance in mill prices on steel bars, plates and structural material has not resulted in any change in warehouse prices. Galvanized sheets continue to move in very good volume.

Warehouse Prices, f.o.b. Cleveland

	Base per Lb.
Plates and structural shapes	3.00c.
Soft steel bars	3.00c.
Reinforcing steel bars	2.25c. to 2.75c.
Cold-finished rounds and hexagons	3.65c.
Cold-finished flats and squares	4.15c.
Hoops and bands	3.65c.
Cold-finished strip	*5.95c.
Black sheets (No. 24)	3.75c.
Galvanized sheets (No. 24)	4.40c. to 4.50c.
Blue annealed sheets (No. 10)	3.25c.
No. 9 annealed wire, per 100 lb.	$2.90
No. 9 galvanized wire, per 100 lb.	3.35
Common wire nails, base per keg	2.90

*Net base, including boxing and cutting to length.

Reinforcing Bars.—Considerable work is still pending and one 300-ton inquiry developed during the week. Rail steel bars are still quoted at 1.65c., mill, makers not having followed the advance made on billet steel bars.

Old Material.—The market has a weak tone, but prices have not declined. There is no new demand from consumers. Scrap is coming out more plentifully at prevailing prices, but dealers are not buying much material to fill old orders. Dealers are now paying $15 for heavy melting steel for Youngstown delivery, a reduction of 25c. a ton from a week ago, but they are unable to buy blast furnace scrap below $10.50. Offerings of scrap by the automotive industry in Michigan for February are heavy, reflecting the increase in plant operations. Lists out for closing this week aggregate over 16,000 tons. These include the Buick Motor Car Co., 6000 tons; Dodge Brothers, Inc., 4000 tons; Chrysler Corporation, 2400 tons, and the Chevrolet Motor Car Co., 3700 tons.

Prices per gross ton, delivered consumers' yards:

Basic Open-Hearth Grades	
No. 1 heavy melting steel	$13.75 to $14.00
No. 2 heavy melting steel	13.25 to 13.50
Compressed sheet steel	12.75 to 13.00
Light bundled sheet stampings	11.50 to 11.75
Drop forge flashings	12.50 to 13.00
Machine shop turnings	9.00 to 9.25
No. 1 railroad wrought	11.50 to 12.00
No. 2 railroad wrought	13.50 to 14.00
No. 1 busheling	11.50 to 12.00
Pipes and flues	9.00 to 9.50
Steel axle turnings	12.50 to 13.00
Acid Open-Hearth Grades	
Low phosphorus forging crops	16.50 to 17.00
Low phosphorus, billet, bloom and slab crops	17.00 to 17.50
Low phosphorus sheet bar crops	16.50 to 17.00
Low phosphorus plate scrap	16.00 to 16.50
Blast Furnace Grades	
Cast iron borings	10.50 to 10.75
Mixed borings and short turnings	10.50 to 10.75
No. 2 busheling	10.50 to 10.75
Cupola Grades	
No. 1 cast	16.50 to 17.00
Railroad grate bars	11.00 to 12.00
Stove plate	12.00 to 12.50
Rails under 3 ft	18.00 to 18.50
Miscellaneous	
Railroad malleable	15.00 to 15.50
Rails for rolling	16.25 to 16.50

Iron Ore.—Lake Superior ore consumed during December amounted to 3,992,099 tons, a gain of 178,462 tons over the previous month. Consumption in December, 1926, was 4,562,020 tons. Furnace stocks Jan. 1 amounted to 30,977,605 tons. On Jan. 1 there were 37,581,944 tons of ore on hand at furnaces and Lake Erie docks as compared with 38,425,751 tons on the same date a year ago. Central district furnaces during December consumed 1,906,341 tons, a gain of 65,177 tons over the previous month. Lake front and Canadian furnaces used 1,882,547 tons, an increase of 120,561 tons, and all rail furnaces consumed 138,791 tons, an increase of 4608 tons. Eastern furnaces consumed 64,420 tons, or a decrease of 11,884 tons as compared with November. On Dec. 31 there were 144 furnaces in blast using Lake ore, a gain of two for the month.

Warehouse Prices, f.o.b. Philadelphia

	Base per Lb.
Plates, ¼-in. and heavier	2.50c. to 2.60c.
Plates, 3/16-in.	2.80c. to 3.00c.
Structural shapes	2.50c. to 2.60c.
Soft steel bars, small shapes and iron bars (except bands)	2.50c. to 2.60c.
Round-edge iron	3.50c.
Round-edge steel, iron finished, 1½ x 1½ in.	3.50c.
Round-edge steel, planished	4.30c.
Reinforcing steel bars, square, twisted and deformed	2.50c. to 3.00c.
Cold-finished steel, rounds and hexagons	3.25c. to 5.25c.
Cold-finished steel, squares and flats	3.75c. to 5.75c.
Steel hoops	3.85c. to 4.15c.
Steel bands, No. 12 gage to 3/16-in., inclusive	3.60c. to 3.90c.
Spring steel	5.00c.
Black sheets (No. 24)	4.25c.
Galvanized sheets (No. 24)	5.10c.
Blue annealed sheets (No. 10)	3.15c.
Diamond pattern floor plates—	
¼-in.	5.30c.
3/16-in.	5.50c.
Rails	3.20c.
Swedish iron bars	6.60c.

Bolts, Nuts and Rivets.—The demand for bolts and nuts from practically all sources shows considerable gain this month over December, and makers say that their January business will be the best of any month since last June. The demand for rivets also shows some improvement. Practically all orders are in the form of specifications against contracts placed at regular prices.

Semi-Finished Steel.—Specifications for sheet bars show a gain and the leading local producer has started up two additional open-hearth furnaces, now operating 10 of 14. The ruling quotation is $33, Cleveland, or $1 a ton below the last quarter price. Billets and slabs are unchanged at $33.

Coke.—The demand for by-product coke for domestic use is very dull and one Valley producer has shut down some of its ovens. The market is not firm, with $4.50 the nominal quotation for egg size. Connellsville foundry coke is moving slowly with prices unchanged at $3.75 to $5.10, ovens.

Philadelphia

All Mills Not Yet On New Price Basis—Pig Iron Quiet

PHILADELPHIA, Jan. 24.—A few eastern Pennsylvania producers of plates and shapes have not yet followed the recent advance of $1 a ton by the leading interest, but general adherence to the new level is expected in a few days. Consumers not already fully covered at the former basis of 1.80c. per lb., Pittsburgh, have been protected with first quarter contracts, so that no real test of the new level of prices is expected until second quarter contracts are considered.

Sheets still exhibit a tendency to weakness, although local consumers in the field of automobile body building and radio manufacture have been making some small purchases in addition to their contracts. With most consumers of pig iron well covered for the first quarter, current business is mostly in carload lots. The scrap market continues quiet, but with steel mills beginning to make small increases in operations, dealers foresee more firmness in prices.

At the opening of bids by the Pennsylvania Railroad, Jan. 20, on 25,000 tons of plates, 8000 tons of bars and 2000 tons of shapes, quotations were on the basis of 1.80c. per lb., Pittsburgh. For delivery in the Chicago district, the leading interest quoted 1.95c. per lb., Chicago, the new price effective the day of the opening of bids.

Pig Iron.—With the exception of the usual number of orders for carload lots of foundry iron the market is quiet, most consumers having covered their requirements for the present. The Standard Steel Works Co., which inquired for 3000 to 4000 tons of low phosphorus iron, is understood to have closed on 3500 tons with a large eastern Pennsylvania producer. Purchases at present being confined to small lots, the basis of $19.50 per ton on foundry iron is evidently being maintained without difficulty. No sales of basic are reported. About 400 tons of Virginia iron was closed in this district last week.

Prices per gross ton at Philadelphia:

East. Pa. No. 2 plain, 1.75 to 2.25 sil.	$20.26
East. Pa. No. 2X, 2.25 to 2.75 sil.	20.76
East. Pa. No. 1X	21.26
Basic (delivered eastern Pa.)	$19.50 to 20.00
Gray forge	19.75 to 20.25
Malleable	21.00 to 21.50
Standard low phos. (f.o.b. New York State furnace)	23.00 to 24.00
Copper bearing low phos. (f.o.b. furnace)	23.50 to 24.00
Virginia No. 2 plain, 1.75 to 2.25 sil.	24.54 to 25.04
Virginia No. 2X, 2.25 to 2.75 sil.	25.04 to 25.54

Prices, except as specified otherwise, are delivered Philadelphia. Freight rates: 76c. to $1.64 from eastern Pennsylvania furnaces; $4.54 from Virginia furnaces.

Billets.—Purchases are still of small tonnages, but have been slightly larger in number recently. Prices are unchanged at $33 per ton, Pittsburgh, for rerolling billets and $38 per ton for forging quality.

Bars.—The advance to 1.85c. per lb., base, Pittsburgh, by the Carnegie Steel Co., has been followed by the independent producers of bars and a good flow of specifications against contracts is reported. Bids on 8000 tons of bars in the list of the Pennsylvania Railroad ranged from 1.95½c. to 2.05c. per lb., base, delivered Altoona, Pa., or 1.80c. per lb., base Pittsburgh, Johnstown, Struthers, Midland, Pa., Buffalo, Cleveland and Youngstown or f.o.b. Pennsylvania Railroad tracks.

Shapes.—All eastern Pennsylvania mills have not yet followed the advance of $1 a ton to 1.85c. per lb., Pittsburgh, 2c. per lb., Bethlehem, or 2.13c. per lb., delivered Philadelphia. There are a number of small fabricated projects under consideration and some large bridge work. Contract for the Detroit tunnel, which will require about 4000 tons of sheet steel piling, is reported to have gone to a New York contractor. Prices on 2000 tons of shapes on the Pennsylvania Railroad list were 1.95c., Bethlehem; 1.90c., Lackawanna, N. Y.; 1.80c., Pittsburgh; 1.75c., Pottsville; 1.95c., Phoenixville, and 1.80c., f.o.b. Pennsylvania Railroad tracks.

Plates.—The new quotation on plates of 2c. per lb., base, Coatesville, or 2.10c. per lb., Philadelphia, is effective with eastern Pennsylvania producers except for two mills, which are expected to advance in a few days. Specifications against contracts are reported in satisfactory volume. Bids on 25,000 tons of plates for the Pennsylvania Railroad were 1.80c. per lb., Pittsburgh, Harrisburg, Johnstown, Coatesville, Conshohocken, Pa., Cleveland, Youngstown and Steubenville, Ohio, Claymont, Del., and Weirton, W. Va., or f.o.b. Pennsylvania Railroad tracks.

Sheets.—Although local consumers including radio and automobile body makers have been purchasing small lots in addition to their contracts, the market still shows weakness. Makers of blue annealed sheets are endeavoring to maintain the 10c. per 100 lb. extra for widths greater than 40 in., but occasional concessions are reported. Black sheets are fairly firm at 2.75c. per lb., Pittsburgh. Galvanized sheets at 3.75c. per lb., base, are reported showing a tendency to weakness. Concessions have been given on desirable business.

Warehouse Business.—Following the brief period of activity that began with the new year, demand for material from stock has shown a slight decline. Prices are substantially unchanged, but competition for desirable orders is still keen and concessions are obtainable.

Imports.—In the week ended Jan. 21 a total of 2675 tons of iron, chrome and zirconium ores arrived at this port, of which 1750 tons was iron ore from Persia, 800 tons chrome ore and 125 tons zirconium ore from Brazil. Pig iron totaled 4750 tons; 2850 tons of British, 1495 tons of Indian and 405 tons of Dutch. Steel imports were all from Belgium and included 137 tons of shapes, 106 tons of bars, 52 tons of strip steel and 17 tons of bands.

Old Material.—Prices of all grades of scrap are showing a tendency toward firmness although demand has not increased. Consumers are reported to have good stocks of scrap on hand, but with better operation dealers foresee the development of some purchasing. Prices are unchanged.

Prices per gross ton delivered consumers' yards, Philadelphia district:

No. 1 heavy melting steel	$13.50 to $14.00
Scrap T rails	13.00 to 13.50
No. 2 heavy melting steel	11.00 to 11.50
No. 1 railroad wrought	15.25 to 15.75
Bundled sheets (for steel works)	10.50 to 11.00
Machine shop turnings (for steel works)	11.00
Heavy axle turnings (or equivalent)	12.00 to 12.50
Cast borings (for steel works and rolling mill)	11.00
Heavy breakable cast (for steel works)	15.50 to 16.00
Railroad grate bars	13.00
Stove plate (for steel works)	13.00
No. 1 low phos., heavy, 0.04 per cent and under	18.00 to 18.50
Couplers and knuckles	16.00 to 16.50
Rolled steel wheels	15.50 to 16.00
No. 1 blast furnace scrap	10.00 to 10.50
Machine shop turnings (for rolling mill)	11.00 to 11.50
Wrought iron and soft steel pipes and tubes (new specifications)	13.00 to 13.50
Shafting	17.50 to 18.00
Steel axles	19.00 to 20.00
No. 1 forge fire	11.00 to 12.00
Steel rails for rolling	15.00 to 15.50
Cast iron carwheels	15.50 to 16.50
No. 1 cast	16.00 to 16.50
Cast borings (for chemical plant)	15.00 to 15.50

W. H. DAVEY HEADS MERGER

New Empire Steel Corporation Elects President and 19 Directors

The Empire Steel Corporation, recently formed to merge six Ohio sheet mills, effected its organization at a meeting held in Cleveland, Jan. 23, by the election of a board of 19 directors and W. H. Davey, president of the Mansfield Sheet & Tin Plate Co., as president.

Other companies involved in the merger are the Ashtabula Steel Sheet Co., Ashtabula, Ohio; Thomas Sheet Steel Co., Waddell Steel Co. and Falcon Steel Co., Niles, and the Empire Steel Co., Cleveland.

With Mr. Davey there are on the directorate: H. S. Pickands, Pickands, Mather & Co, Cleveland; A. I. Davey, vice-president Mansfield company; C. F. Ackerman, Mansfield banker; C. H. Henkel, Mansfield attorney; M. C. Robinson, director of the Ashtabula company; Samuel, John, Harold and F. A. Davey, Mansfield; J. D. Waddell, president, and R. L. McCorkle, vice-president, Waddell Steel Co.; W. R. Jenkins, secretary Mansfield company; A. W. Wheatley, Lima, president Empire Steel Co.; E. C. Werner, Delphos, Ohio; C. S. Thomas, chairman of the Thomas Sheet Steel Co.; C. F. Smith, Youngstown, temporarily representing W. A. Thomas, president of the Thomas company; Lloyd Booth, president, and Paul Wick, vice-president, Falcon Steel Co.

Meetings of the stockholders will be held next week to ratify the merger, but it is stated that this will be merely formal action, as proxies have been secured from owners of the required number of shares. The merger will become operative as of Nov. 1, 1927. Headquarters will be in Mansfield.

SMALL INCREASE IN EXPORTS

Gain of 1927 Over 1926 Was Less Than 1 Per Cent—Imports Declined

WASHINGTON, Jan. 24.—Exports of iron and steel products from the United States during 1927 totaled 2,180,969 gross tons, against 2,167,213 tons in 1926. Imports for the two years amounted to 750,467 tons and 1,110,049 tons, respectively, according to preliminary figures of the Department of Commerce. Exports during December were 168,428 tons, compared with 177,928 tons in November. Imports in December totaled 64,188 tons, against 61,882 tons in November.

Tin plate was the principal item exported last year, with a total of 254,131 tons. Other products exported in large quantities during the year were boiler tubes and welded pipe, 248,415 tons, and scrap, 238,303 tons. Of the more outstanding imports structural shapes, with a total of 161,848 tons, led. Pig iron, 133,068 tons, and steel bars, 91,497 tons, were second and third. Receipts of cast iron pipe, 81,769 tons, were less than those of 1926 by 2104 tons.

Scrap made up the largest item of exportation in December, with 22,668 tons. Exports of boiler tubes and welded pipe aggregated 18,154 tons, and those of tin plate, 15,856 tons.

In the import movement in December structural shapes, totaling 14,529 tons, led, with pig iron, 14,299 tons, second. Receipts of steel bars totaled 8117 tons, cast iron pipe, 3112 tons, and "other pipe," largely seamless tubes, 1725 tons.

Engineering and other progress in modern Iceland will be outlined by Earl Hanson, explorer, at a meeting of the railroad division of the American Society of Mechanical Engineers, to be held at the Engineering Society Building, New York, March 1. Vilhjalmur Stefansson and other explorers have also been invited to address the meeting. In addition to engineering projects, Mr. Hanson will discuss special technical problems, manufacturing requirements, import and export trade and the economic possibilities of the island. He will also outline a proposed railroad project.

San Francisco

Oil Tanks Take 1000 Tons of Steel—Cast Iron Pipe Awards

SAN FRANCISCO, Jan. 21 (*By Air Mail*).—Oil storage tanks, awarded by the Petroleum Securities Co. of Los Angeles for its new Richmond, Cal., plant, call for 1000 tons of plates and shapes. The Western Pipe & Steel Co. got the business. Other awards included 1250 tons for a medical building in Los Angeles, taken by the Union Iron Works; 2237 tons of cast iron pipe for Portland, Ore., taken by the United States Cast Iron Pipe & Foundry Co., and 1521 tons of cast iron pipe for Spokane, Wash., divided between the latter company and the Pacific States Cast Iron Pipe Co.

Pig Iron.—Inquiries and sales during the week involved small lots only. The market is quiet. Prices continue unchanged.

Prices per gross ton at San Francisco:

*Utah basic	$25.00 to $26.00
*Utah foundry, sil. 2.75 to 3.25	25.00 to 26.00
**Indian foundry, sil. 2.75 to 3.25	24.00 to 25.00
**German foundry, sil. 2.75 to 3.25	24.25

*Delivered San Francisco.
**Duty paid, f.o.b. cars San Francisco.

Shapes.—The only structural steel award of importance, other than the medical building in Los Angeles, mentioned above, was taken by Herrick Iron Works and called for 350 tons for the Women's Athletic Club, Oakland, Cal. Awards during the week totaled 2110 tons. Pending business is of fair proportions, the largest new inquiry involving 270 tons for an apartment house in San Francisco. Plain material is firm at 2.35c., c.i.f. Coast ports.

Plates.—The award of oil storage tanks by the Petroleum Securities Co. involved two 80,000 bbl. and five 21,000 bbl. tanks. In addition, three 100,000 bbl. tanks will be erected, the material for these tanks having been purchased and fabricated over a year ago. The Steel Tank & Pipe Co. sold 250 tons additional for the Port Townsend, Wash., pipe line, bringing the total to 850 tons. Bids will be taken on Jan. 27 for the second unit of this project, involving about 16,000 ft. of 24 in. riveted pipe. Prices continue firm at 2.25c., c.i.f.

Bars.—The largest reinforcing bar award involved 326 tons for the Stony Gorge Dam at Orland, Cal., 281 tons going to the Pacific Coast Steel Co. and the balance to the Laclede Steel Co. Pending business exceeds 6000 tons. Prices in the San Francisco district are by no means firm, and out-of-stock material continues to be quoted around 2.25c.

Cast Iron Pipe.—The United States Cast Iron Pipe & Foundry Co. took 2237 tons of 6 to 12 in. De Lavaud and 18 to 24 in. class B pipe for Portland, Ore. Spokane, Wash., placed 1253 tons of 1¼ to 8 in, class 150 pipe with the Pacific States Cast Iron Pipe Co. and 268 tons of 12 in. class 150 to the United States Cast Iron Pipe & Foundry Co. The Walworth Co. of Oregon took 340 tons of 4 to 12 in. class D pipe for The Dalles, Ore., and Roy & Titcomb, Inc., Tucson, Ariz., secured 373 tons of 2 to 10 in, class B pipe for Nogales, Ariz. The United States Cast Iron Pipe & Foundry Co. was awarded 100 tons of 4 to 10 in. class B pipe. New and pending business includes 1244 tons of 6 to 12 in. class C and D pipe for Vancouver, B. C.; 651 tons of 4 to 12 in. class B for Lafayette, Colo., and 130 tons of 4 to 8 in. class B for Chehalis, Wash. Bids have been opened on 188 tons of 4 to 8 in. class B for Chowchilla, Cal., and on 271 tons of 2 to 10 in. class C pipe for the improvement of Twenty-eighth Street, San Diego, Cal. R. H. Downer, San Diego, was low bidder on 155 tons of 4 to 6 in. class B pipe for the improvement of Boundary Street, San Diego.

Warehouse Prices, f.o.b. San Francisco

	Base per Lb.
Plates and structural shapes	3.15c.
Soft steel bars	3.15c.
Small angles, 3/16-in. and over	3.15c.
Small angles, under 3/16-in	3.55c.
Small channels and tees, ¾-in. to 2¾-in.	3.75c.
Spring steel, ¼-in. and thicker	5.00c.
Black sheets (No. 24)	4.80c.
Blue annealed sheets (No. 10)	3.75c.
Galvanized sheets (No. 24)	5.35c.
Structural rivets, ½-in. and larger	5.65c.
Common wire nails, base per keg	$3.35
Cement coated nails, 100-lb. keg	3.35

Steel Pipe.—Lafayette, Colo., will take bids on Jan. 31 for 146 tons of 4 to 12 in. standard pipe and will also take alternate bids on cast iron pipe.

Coke.—A large shipment of English beehive and by-product coke is due on the Coast next week and will be divided between consumers in the Los Angeles and San Francisco districts. Most of this shipment is to apply against contracts placed some time ago. Demand is fair. Prices are unchanged.

Birmingham

Basic Pig Iron $1 Lower—Plates, Shapes, Bars $1 Higher

BIRMINGHAM, Jan. 24.—New pig iron business is scattered and irregular. There is some tonnage in small lots, but most of the requirements for January and part of February have been placed. Quotations for foundry are still on a $16 base. Basic iron is being quoted by one producer at $15. The other two producers of basic are using their own production. The Tennessee Coal, Iron & Railroad Co. blew out Bessemer No. 1 furnace on Jan. 20. This company is operating only six of 12 blast furnaces. There are now 17 furnaces in blast in Alabama.

Prices per gross ton, f.o.b. Birmingham district furnaces:

No. 2 foundry, 1.75 to 2.25 sil	$16.00
No. 1 foundry, 2.25 to 2.75 sil	16.50
Basic	15.00

Finished Steel.—Plates, bars and structural shapes have again been advanced $1 per ton. Inquiries are holding up well and new business has been in fair volume. The Tennessee company has placed another open-hearth furnace in operation and now has 12 producing, eight at Ensley and four at Fairfield. The Gulf States Steel Co. continues with four.

Cast Iron Pipe.—Considerable tonnage in prospect from the larger cities is slow in materializing. Dallas, Tex., opened bids last week on a tonnage.

Coke.—Quotations remain at $5. The new by-product unit of the Tennessee Coal, Iron & Railroad Co., consisting of 63 Koppers ovens of the Becker type, will be completed in February.

Old Material.—Buying was a little better last week and more tonnage was moved.

Prices per gross ton, delivered Birmingham district consumers' yards:

Heavy melting steel	$9.50 to $10.00
Scrap steel rails	11.00 to 11.50
Short shoveling turnings	8.00 to 8.50
Cast iron borings	8.00 to 8.50
Stove plate	13.00 to 14.00
Steel axles	19.00 to 20.00
Iron axles	20.00 to 21.00
No. 1 railroad wrought	10.00 to 10.50
Rails for rolling	13.00
No. 1 cast	15.00
Tramcar wheels	12.50 to 13.50
Cast iron carwheels	12.00 to 13.00
Cast iron borings, chemical	13.50 to 14.00

Warehouse Prices, f.o.b. St. Louis

	Base per Lb.
Plates and structural shapes	3.25c.
Bars, soft steel or iron	3.15c.
Cold-finished rounds, shafting and screw stock	3.75c.
Black sheets (No. 24)	4.45c.
Galvanized sheets (No. 24)	5.25c.
Blue annealed sheets (No. 10)	3.60c.
Black corrugated sheets (No. 24)	4.50c.
Galvanized corrugated sheets	5.30c.
Structural rivets	3.75c.
Boiler rivets	3.75c.
	Per Cent Off List
Tank rivets, 7/16-in. and smaller, 100 lb. or more	70
Less than 100 lb.	65
Machine bolts	60
Carriage bolts	60
Lag screws	60
Hot-pressed nuts, square, blank or tapped, 200 lb. or more	60
Less than 200 lb.	50
Hot-pressed nuts, hexagons, blank or tapped, 200 lb. or more	60
Less than 200 lb.	50

St. Louis

Better Business in Plates for Oil Tanks —Scrap Is Weaker

ST. LOUIS, Jan. 24.—Sales of pig iron during the last week included 2100 tons, mostly malleable, booked by the Granite City maker, and 1400 tons sold by a leading Southern maker. Melters of malleable are beginning to enter the market. Prices are unchanged.

Prices per gross ton at St. Louis:

No. 2 fdy., sil. 1.75 to 2.25 f.o.b. Granite City, Ill.	$19.50 to $20.00
Northern No. 2 fdy., delivered St. Louis	20.66
Southern No. 2 fdy., delivered	20.42
Northern malleable, delivered	20.66
Northern basic, delivered	20.66

Freight rates: 81c. from Granite City to St. Louis; $2.16 from Chicago; $4.42 from Birmingham.

Coke.—Another cold wave has brought a revival of buying of domestic grades of coke. Buying of industrial grades is only fair.

Finished Iron and Steel.—The advance of $1 on bars, plates and shapes made by subsidiaries of the United States Steel Corporation and by the Inland Steel Co. is regarded by some interests as stimulating to sales, while others feel that the time is not ripe for higher prices. The Granite City mill, which has not advanced its price on plates, reports a better business on this item as the result of renewed interest in the oil trade. Business is extremely dull with fabricators of structural steel, and operations of their plants in the district are between 40 and 50 per cent of capacity. New reinforcing bar trade is light.

Old Material.—The combination of a halt in buying by consumers and the dumping of a great amount of old material in this market caused a weakness in the market and lower prices. Railroad lists were heavy, and many dealers in the territory contiguous to St. Louis, who had been holding for higher prices, decided to sell at the same time, seeming to sense a break in the market. A leading mill bought a round tonnage of melting steel at the lower prices. Railroad lists include: Chesapeake & Ohio, 5800 tons; Wabash, 1800 tons; Great Northern, 64 carloads; Nickel Plate, 30 carloads; Memphis Street Railway, 300 tons; Chicago, Milwaukee & St. Paul, 1200 tons; Terminal Railway Association (St. Louis), 2800 tons, and Frisco, 17 carloads.

Prices per gross ton f.o.b. dealers' yards and delivered St. Louis district consumers' works:

Heavy melting steel	$12.50 to $13.00
No. 1 locomotive tires	14.00 to 14.50
Heavy shoveling steel	12.50 to 13.00
Miscellaneous standard-section rails, including frogs, switches and guards, cut apart	14.25 to 14.75
Railroad springs	15.00 to 15.50
Bundled sheets	9.00 to 9.50
No. 2 railroad wrought	12.50 to 13.00
No. 1 busheling	10.50 to 11.00
Cast iron borings	9.25 to 9.75
Iron rails	14.00 to 14.50
Rails for rolling	15.25 to 15.75
Machine shop turnings	8.00 to 8.50
Steel car axles	20.00 to 20.50
Iron car axles	24.00 to 24.50
Wrought iron bars and transoms	21.00 to 21.50
No. 1 railroad wrought	11.50 to 12.00
Steel rails, less than 3 ft.	15.75 to 16.25
Steel angle bars	14.00 to 14.50
Cast iron carwheels	14.25 to 14.75
No. 1 machinery cast	15.50 to 16.00
Railroad malleable	12.50 to 13.00
No. 1 railroad cast	14.00 to 14.50
Agricultural malleable	12.50 to 13.00
Relaying rails, 60 lb. and under	20.50 to 23.50
Relaying rails, 70 lb. and over	26.50 to 29.00

Port Henry-Waterbury Pig Iron Freight Rate Held Reasonable

WASHINGTON, Jan. 24.—The rate of $3.65 per gross ton on pig iron from Port Henry, N. Y., to Waterbury, Conn., is not unreasonable, according to an opinion of the Interstate Commerce Commission made public last Saturday in which it ordered dismissal of a complaint by the Manufacturers' Foundry Co., Waterbury. The complainant sought reparation and a future rate on the basis of the rate of $3.15 from Port Henry to Bridgeport, Conn.

Buffalo

Plates, Shapes and Bars Now $1 Higher at Lackawanna Mill

BUFFALO, Jan. 24.—A Buffalo furnace is understood to have taken 1000 tons of malleable pig iron for the Watertown, N. Y., plant of the New York Air Brake Co. for second quarter delivery. The Worthington Pump & Machinery Corporation has placed 700 or 800 tons, of which about 200 tons was for the Buffalo plant. A New England consumer bought 200 to 300 tons of foundry iron. Inquiry has narrowed to small lots.

Prices per gross ton, f.o.b. furnace:

No. 2 plain fdy., sil. 1.75 to 2.25	$17.00
No. 2X foundry, sil. 2.25 to 2.75	17.50
No. 1X foundry, sil. 2.75 to 3.25	18.50
Malleable, sil. up to 2.25	17.50
Basic	17.00
Lake Superior charcoal	27.28

Finished Iron and Steel.—The Bethlehem Steel Co. has announced an advance of $1 a ton on plates, shapes and bars, making its present quotation at the Lackawanna plant 1.95c. for the remainder of the quarter. Inquiry for bars, shapes and plates holds at about the same volume. Sheet inquiry is good, and very little black sheet business is going at less than 2.90c. Automobile body sheets range from 4c. to 4.10c. Sheet mill operation continues at 85 per cent. Wire mills report good shipments of wire cloth and poultry netting. The fence department of the Wickwire company is being moved from Clinton, N. Y., to Buffalo.

Old Material.—There has been a strengthening in prices, headed off by No. 1 heavy melting steel, which is now $15 to $15.50. One of the mills has called for increased shipments and dealers who now have to buy against this old order are paying as much for the scrap as they are receiving. Foundry grades are very quiet and production of turnings and borings is very light.

Prices per gross ton, f.o.b. Buffalo consumers' plants:

Basic Open-Hearth Grades

No. 1 heavy melting steel	$15.00 to $15.50
No. 2 heavy melting steel	13.25 to 13.50
Scrap rails	13.75 to 14.25
Hydraulic compressed sheets	13.50 to 14.00
Hand bundled sheets	8.50 to 9.00
Drop forge flashings	11.50 to 12.00
No. 1 busheling	14.00 to 14.50
Heavy steel axle turnings	12.75 to 13.25
Machine shop turnings	9.00 to 9.25

Acid Open-Hearth Grades

Railroad knuckles and couplers	16.00 to 16.50
Railroad coil and leaf springs	16.00 to 16.50
Rolled steel wheels	16.00 to 16.50
Low phosphorus billet and bloom ends	15.75 to 16.00

Electric Furnace Grades

Heavy steel axle turnings	12.75 to 13.25
Short shoveling steel turnings	10.75 to 11.00

Blast Furnace Grades

Short shoveling steel turnings	10.75 to 11.00
Short mixed borings and turnings	11.00 to 11.50
Cast iron borings	11.00 to 11.50
No. 2 busheling	9.00 to 9.50

Rolling Mill Grades

Steel car axles	16.25 to 16.75
No. 1 railroad wrought	12.50 to 13.00

Cupola Grades

No. 1 machinery cast	14.50 to 15.00
Stove plate	12.75 to 13.00
Locomotive grate bars	10.50 to 11.00
Steel rails, 3 ft. and under	16.50 to 17.00
Cast iron carwheels	14.00 to 14.50

Malleable Grades

Railroad	15.00 to 15.50
Agricultural	15.00 to 15.50
Industrial	15.00 to 15.50

Warehouse Prices, f.o.b. Buffalo

	Base per Lb.
Plates and structural shapes	3.40c.
Soft steel bars	3.30c.
Reinforcing bars	2.75c.
Cold-finished flats, squares and hexagons	4.45c.
Rounds	3.95c.
Cold rolled strip steel	5.85c.
Black sheets (No. 24)	4.30c.
Galvanized sheets (No. 24)	5.15c.
Blue annealed sheets (No. 10)	3.80c.
Common wire nails, base per keg	$3.65
Black wire, base per 100 lb.	3.90

Cincinnati
